Reid offers alternative direct accounts of perception, conception, memory and moral and aesthetic judgment. He stoutly defends our status as continuing responsible agents, claiming that the only genuine causality is agency and that although natural regularities are held to be causes they cannot be full-blooded causes. Continuing persons are not reducible to material entities subject to laws of nature, (pace Priestley); nor does the proper study of responsible agents belong within natural philosophy. Morals may be adequately systematized on a human rights basis according to which private property is not sacrosanct, once moral judgment is recognised to be based on first principles of morals. Judgments of beauty likewise rest on a body of first principles, even though Reid readily allows that there are no properties that all beautiful objects must have in common.

1 Life

Thomas Reid, the founder of the Scottish school of Common Sense Philosophy, was born in Strachan near Aberdeen, Scotland. His mother, Margaret Gregory, was a member of a very scientifically gifted Scottish family. Her brother, David Gregory, was Savilian professor of Astronomy at Oxford and close friend of Sir Isaac Newton. After a formative period in the grammar school and Marischal College, Aberdeen, where George Turnbull was his regent, marrying, and a period as minister at New Machar, Reid was appointed a regent at King's College, Aberdeen, in 1751. While there he co-founded the Aberdeen Philosophical Society or 'Wise Club' whose members included George Campbell, John Stewart, Alexander Gerard and James Beattie. He also produced his Latin 'Philosophical Orations' and wrote his first major work 'An Inquiry into the Human mind on the Principles of Common Sense', published in 1764. Hume found it challenging and it secured Reid the professorship of Moral Philosophy in Glasgow College that year, as successor to Adam Smith. Here his activities culminated in two major

works after his retirement from teaching in 1780, *'Essays on the Intellectual Powers of Man'*, published in 1785, and *'Essays on the Active Powers of the Human Mind'*, published in 1788, a controversy with Joseph Priestly and a fascinating correspondence, particularly with Lord Kames and James Gregory. He died in 1796, survived by one daughter from nine children.

2 Perception and sensation

Reid attacks the view of David Hume that nothing can ever be present to the mind but an image or perception and that the senses are only inlets through which these images are conveyed. According to Hume, the table which we see, and which appears to diminish as we move further from it, is not the real table that exists independently of us and undergoes no alteration as we move away from it; it is the image of the table that is immediately present to the mind, or seen. Reid claims that we have no good grounds for accepting the existence of such images or ideas, arguing that in perceiving something the mind has an immediate acquaintance with it. Perception of an external object involves some conception or notion of the object and an irresistible conviction of its present existence; the conviction is immediate and not inferential (1785: II.v).

But consider smelling a rose and the agreeable sensation raised when the rose is smelled. Reid allows that he is led, by his nature, to conclude some quality to be in the rose, which is the cause of this sensation. However in sensation there is no object distinct from the act of mind as there is in the cases of perception and memory; in 'I feel pain' the distinction between act and object is merely grammatical. Moreover the firm cohesion of the parts of a body is quite unlike that sensation by which I perceive it to be hard. And so sensations are not suitable as bases for inferences to qualities in objects. Given this firm rejection of the doctrine that we can have no conception of any material thing which is not like some sensation, it is hard to see how sensations can be more than occasional causes of conceptions. Reid even raises doubts about the existence of sensations in certain cases of perception (1764: VI). Thus there is no sensation for what he calls visible figure. The different positions on a visually perceived body facing an observer make a two-dimensional figure with length and breadth only. This visible figure represents the three-dimensional form of the perceived body which has length, breadth and thickness.

Sensation is an important ingredient of Reid's distinction between primary and secondary qualities. He states that our senses give us a direct and distinct notion of the primary qualities of objects, in spite of the obstacles mentioned above, but only a relative and obscure notion of secondary qualities: they are unknown qualities that produce certain sensations in us. Yet Reid freely admits (1785: II.xviii) that in seeing a coloured body the sensation is indifferent, drawing no attention, and that the (unknown) quality which we call its colour is the only object of our attention. Presumably we should follow Reid in distinguishing between the colour of a body, conceived to be a fixed and permanent quality in the body, and the appearance of colour to the eye which may be varied in a thousand ways, while not following him in his view that it is the former that we attend to when we look at a coloured object.

Reid thinks there is no visual perception of spherical objects without perception of their visible figure and colour; these are all that is originally perceived by sight even though we learn to perceive by the eye almost anything, including sphericality, that we can originally perceive by touch. It should be clear that this Berkelian view of vision sits uncomfortably with Reid's position that perception of something includes an immediate conviction of its present existence, even though it enables him to dismiss many cases of fallacy of vision as rash inferences.

Reid does not deny that there is no perception unless some impression is made upon the organ of sense either directly or through a medium which is then communicated to the nerves and by them to the brain (1785: II). However, he insists upon the following points. First, there is nothing more ridiculous than to imagine that any motion or modification of matter should produce thought. Second, when I look upon the wall of my room the wall does not act at all and is incapable of action; rather the perceiving of it is an act or operation in me, albeit an involuntary one.

3 Causality

Reid maintains that only beings which, by their active power, produce some change in themselves or in some other being are properly called causes and agents (1788: I). Moreover, whatever is the effect of active power must be something that is contingent, dependent upon the power and will of its cause. Power to produce an effect supposes

power not to produce it, otherwise it is necessity, which is incompatible with power taken in the strict sense. Reid concedes that there is another sense of the term cause, so well authorized by custom that we cannot always avoid using it. He proposes to James Gregory (see Reid 1895) that we call it the ‘physical’ sense, as when we say that heat is the cause that turns water into vapour. A cause, in this sense, means only something which, by the laws of nature, the effect always follows. There is yet another sense of the term ‘cause’ that Reid allows to have currency and which he distinguishes from the sense just explained. Specifically, laws of nature may be called ‘physical’ causes too; but note that they do not bring about anything unless put to work either by some agent or by some physical cause.

Why does Reid maintain that physical causes are not true causes? One reason is that they cannot be ultimate. Thus, that a body put in motion continues to move until stopped might be viewed as an effect of an inherent property of matter, and so as not physically ultimate. If so, we may say that that property of matter is the physical cause of the continuing motion; but surely the ultimate cause of this is the being who gave the inherent property to matter. Alternatively the continuing motion may be viewed as an arbitrary appointment of the Deity, and may then be called a law of nature and a physical cause. But such a law requires a being to enact it.

Must that being be an agent? Reid answers (1788: IV.ii) by invoking as a first principle the thesis ‘that neither existence, nor any mode of existence, can begin without an efficient cause’, from which it follows ‘that everything which undergoes any change must either be the efficient cause of that change in itself, or it must be changed by some other efficient’. Reid adds that we can only conceive kinds of active power similar or analogous to the kind we attribute to ourselves, which is exerted by will and with understanding.

Again, consider the notion of a physical cause as something which, by the laws of nature, the effect always follows. Now given this account it would seem that, on Reid’s view, the existence of such causes is, at best, contingent. Thus he says that the conjunction between a physical cause and its effect must be constant, unless in the case of a miracle, or suspension of the laws of nature. Moreover, processes such as evaporation are frequently interrupted in quite ordinary ways. Finally, it is clear that this account of physical causes will not, of itself, suffice to deal with the problem that Reid left for regularity accounts of physical causation, namely that, according to them, day is the cause of night and night of day.

Let us now turn to consider Reid’s account of how physical causes are to be discovered. Reid (1785: I) adopts a Newtonian view on this question (see Newton, I.), maintaining that if anyone claims to show us the cause of any natural effect, whether pertaining to matter or to mind, we must first consider whether there is sufficient evidence that the cause really exists. If there is not, it should be rejected as a fiction. If it does really exist, we are to consider next whether the effect necessarily follows from it. And, Reid adds, conjectures about causes should be treated as ‘reveries of the vain’. However, writing to Kames (see Home, H.), he allows that such conjectures can have definite value in the following way. Attending to a given phenomenon, I conjecture that it may be owing to a certain cause. This may lead me to make the experiments or observations appropriate for discovering whether that is really the cause or not; and if I discover that it is or that it is not, my knowledge is improved and it is clear then that my conjecture was a means to that improvement.

The establishing of efficient causes is not within the sphere of natural philosophy, the method of which is experimental and leads to the establishing of physical causes at best. Indeed, Reid writes to Kames (see Reid 1965), apart from the fact that our nature leads us to believe ourselves to be the efficient causes of our own actions, and that from analogy we judge the same of other intelligent beings (with the result that attributions of human action are outside the sphere of natural philosophy) we are left, for the establishing of efficient causes, with nothing but resort to such first principles as that every beginning of existence has an efficient cause, and that an effect which has the most manifest marks of intelligence, wisdom and goodness, must have an intelligent, wise and good efficient cause. And with final causes, apparently so pervasive, it is similar (see Causation).

4 Motivation and action

Faced with a deterministic universe the particles of which are initially set in motion by a Deity who prescribes Newton’s laws of motion for them, it is hard to see how anything that happens to particles can be an action of mine. What I call my actions would seem to become mere movements of masses of particles, given that I am such a mass. But even if we do not accept this simple picture, problems remain. To say that people act is, Reid thinks, to

say that we are efficient causes. How might that status be established for us? Reid responds by claiming (1788: I.vi) that it is a first principle that I am the cause that has power to produce certain motions of my body and directions of my thought.

Reid admits the fact of an established harmony between our willing certain motions of our bodies and the operations of the appropriate nerves and muscles. Now the willing is an act of the mind; but whether it has any physical effect upon the nerves and muscles, or whether it is only an occasion of their being acted upon by some other efficient cause according to established laws of nature, is not known to us. ‘This may leave some doubt whether we be, in the strictest sense, the efficient cause of the voluntary motions of our own body’ (1788: I.vii). He continues: ‘The man who knows that such an event depends upon his will, and who deliberately wills to produce it is, in the strictest moral sense the *cause* of the event; and the event is justly imputed to him, no matter what physical causes may have concurred in its production.’ However Reid has just shown that it is far from clear that the motion depends upon his will. For he has correctly pointed out that, for all we can know, the volition is at best an occasional cause of the operations of the nerves and muscles. Moreover, he holds that occasional causation, as in the case of night following day, does not of itself amount to physical causation. So unless Reid is willing to allow that dependency can be instanced by occasional causation, there is no clear sense in which the bodily movement depends upon the will.

Reid maintains (1788: IV) that for a bodily movement to be rated as an action of a free agent it is not sufficient that there arise a determination of the will that the movement be produced; it is also required that the agent deliberately willed to produce it. Indeed if they cannot discern one determination to be preferable to another, and thereby exercise their power to choose, their determinations can be neither right nor wrong, wise nor foolish. It is when an agent exercises their active power to determine, or decide upon, their course of action that they act with the liberty of a moral agent. Now the difficulty about whether we are in the strictest sense the cause of so-called voluntary bodily movements emerges once again at the level of voluntary determinations of the will.

The determination of the will the fulfilment of which is my bodily movement must have a cause which had power to produce it. Now the cause is either myself or some other being. But we must ask in what circumstances a determination of will to move my right arm up rates as caused by me. Clearly, first, I must have the power to bring about the determination. Second, the only way in which the exercise of power is conceivable is via a determination of the will. So the only way in which I can conceive of a determination of the will being caused by me is via a prior determination of my will. But what if that prior determination of the will is not brought about by me? Then it would appear that the prior determination - the determination via which my decision to raise my arm up was formed - was either the product of another agent or of myself. In the former case the decision to raise my arm up was not an exercise of moral liberty. Let us remember, however, that it does not follow from the contention that an exercise of active power without will is not clearly conceivable by us that it is impossible.

What is the alternative to the belief that we are efficient causes with moral liberty? We might think that every event, including thoughts and actions, has a physical cause, arguing that if thinking and behaviour are not governed by universal exceptionless laws, they must be random, and consequently that rewards and punishments are without effect. Arguably every deliberate action must have a motive. When there is no conflicting motive this motive must cause us to act. When there are contrary motives the strongest must prevail.

Reid confronts such positions vigorously in (1788: IV.iv). Whether every deliberate action must have a motive depends upon how we understand deliberation. If deliberation means the weighing of motives, then there must be motives - and conflicting ones at that. But if a deliberate action means only an action done through a cool and calm determination, it is not clear that such determinations must be reached by weighing. Consider a case where an end of some importance may be achieved equally well by various means, none of which has any special appeal to the agent. Again the position that when there is a motive on only one side that motive must determine the action ignores such factors as caprice, quite apart from its presumption that motives are the sole causes of actions. But many motives, such as money, or success, are often not even things that exist, but *entia rationis* (mental constructions), which may best be compared to advice or exhortation, leaving the agent still at liberty to choose. However, we can find entities to serve as occasional causes of determinations such as the desire for money.

When it is said of conflicting motives that the strongest always prevails, Reid rightly points out that this cannot be affirmed or denied with understanding until we know what is meant by the strongest motive. Reid allows that

when the contrary motives are of the same kind and differ only in quantity it may be easy to say which is the strongest. Thus a bribe of a thousand pounds is a stronger inducement than one of a hundred pounds. But when the motives are of different kinds, as are money and integrity, we have no rule by which to judge which is the stronger. If we go for prevalence, then the strongest motive would simply be the one that prevailed and the maxim would be trivially true.

These remarks would seem to apply to motives such as hunger and lust, which we have in common with ‘the brutes’. Reid maintains that in their case the strongest motive always prevails, since brutes lack self-command. But this must be so on the trivial interpretation of the maxim. Reid claims that in contrast humankind judges the strength of its appetites by the conscious effort which is needed to resist them. And since it is possible for a person to resist with effort a strong appetite, the strongest appetite does not always prevail (see Desire).

What of rational motives? An interesting example is our good ‘upon the whole’ - that which, taken with all its discoverable connections and consequences, brings more good than ill. Another is our duty. No sooner do we have the former conception than we are ‘led by our constitution’ to seek the good and avoid the ill. So perhaps rational principles of action motivate by themselves. Reid characterises some rational motives as the conviction of what we ought to do in order to achieve some end we have judged fit to be pursued. Such motives may very properly be compared to advocates pleading at the bar. To say that an advocate was the more powerful pleader because judgment was given on their side would be unsatisfactory; once again strength does not guarantee prevalence (see Action).

5 Language and conception

Reid distinguishes proper names and general words in (1785:V). A general word signifies either an attribute or a combination of attributes; a proper name signifies an individual. By affirming a singular substantive (for example, ‘horse’) of an individual we claim it to have all the attributes each of which must be possessed by any member of the class named by its plural (‘horses’). From the infinite number of combinations of attributes that might be formed, we choose for purposes of classification only those that are useful for arranging our thoughts in discourse and in reasoning.

Concerning the conception of individual things that really exist, Reid says (1785: IV), that the things conceived are the *actual* things, which need not act upon him, nor him on them, in order to be conceived. Such conceptions are called ‘true’ when they agree with the thing conceived in respect of its attributes and relations. In ‘general conception’ what is conceived is the meaning of the general term, attribute or combination of attributes - the conception affixed to it by those who best understand the language.

There are conceptions which Reid calls ‘fancy pictures’. Such are the conceptions which Swift formed of Laputa, and Cervantes of Don Quixote and his squire. We can give names to such creatures of the imagination, conceive them distinctly, and reason consequentially concerning them (1785: IV.i), although there are no bearers for these names outside the story. Reid insists that he can conceive a centaur (1785: IV.ii). Conceiving is an operation of the mind. The sole object in this case is a centaur, an animal which has never existed. Reid rightly insists that what he conceives is not the image of an animal but an animal. It is a body of a certain figure and colour, having life and spontaneous motion. It would seem to be an individual nonexistent. Thus, for Reid the question of how conceiving of nonexistents is possible is, arguably, equivalent to that of how the conceiving of nonexistent individuals is possible.

‘Suppose I conceive a triangle, that is, a plain figure terminated by three right lines. He that understands this definition distinctly has a distinct conception of a triangle. But a triangle is not an individual; it is a species. … the thing conceived is general, and cannot exist without other attributes’ (1785: V.ii). A triangle that really exists must have a certain length of sides and measure of angles, a fixed time and place; the definition of a triangle includes neither existence nor any of these other attributes. Such passages suggest that Reid thinks that an *ens rationis* is a combination of attributes lacking certain members. But does Reid really think that Don Quixote is a universal?

Reid readily allows that one may conceive of a plan of government which is never put into practice (1785: V.iv). Such compositions are things conceived in the mind of the author, not individuals that really exist; the same general conception which the author had may be communicated to others by language. This seems to support the view that Don Quixote is general. And a mere combination of attributes lacks real existence, although Reid allows

that we may ascribe existence to a universal in the sense of its being actually instantiated.

Reid insists that we have clear and distinct conceptions of attributes. He certainly maintains that the attributes of individuals are all we can distinctly conceive about them; but he also holds (1785: V.ii) that the whiteness of this sheet is one thing and whiteness another thing, and that, unlike whiteness, it is not a universal. Attributes are expressed by general words. The other class of general terms is of those terms that signify the genera and species into which we divide and subdivide things. This division neglects certain substantive-like expressions such as ‘entity’; if these are genuine substantives they can scarcely be said to signify a finite collection of attributes, where things that possess them all belong to one kind. Reid himself notices that the adjective ‘beautiful’ is applied to things of such different kinds that he is unable to conceive any quality that is in all the different things to which it applies (see Concepts).

6 The beautiful and the sublime

For Reid, taste is a power of the mind by which we are capable of discerning and enjoying both the beauties of nature and whatever is excellent in the fine arts (1785:VIII) (see Artistic taste). In the end, we always judge that there is some real excellence in beautiful objects. In some cases that excellence is distinctly conceived and can be pointed out (for example, a primary quality), while in other cases objects appear beautiful at first encounter without our being able to specify any excellence (for example, a secondary or occult quality).

When confronted by a beautiful object we should distinguish the pleasure produced in us from the quality in the object that causes it. Nevertheless, Reid emphasizes that since beauty is found in things so various and so very different in kind, it is at least difficult to say in what beauty consists. ‘What can it be that is common to the thought of a mind, and the form of a piece of matter, to an abstract theorem, and a stroke of wit?’ If the beauty of a stroke of wit were its excellence, and the beauty of a proof its excellence, there would be a negative answer to this question. However, since ‘excellent’ does not express an attribute or combination of attributes save when conjoined with a genuine substantive, this answer poses no problem for Reid’s account of significance for full-blooded general terms.

Reid holds that the excellence of an object justifies the judgment of beauty. Our taste ought to be accounted most just and perfect when we are pleased with things most excellent of their kind, and displeased with the contrary. Every excellence has a real beauty and charm that makes it an agreeable object to those of good taste. Of course, Reid thinks that since judgments of taste are either true or false, there must be first principles of taste. But does every judgment of beauty depend for its truth on some excellence the object has (pace Kant)?

Reid does indeed allow that some objects appear beautiful at first sight without our being able to specify any excellence that could justify our judgment, citing the plumage of birds and butterflies as examples. But he claims that by a careful examination of such objects we may perhaps discover some real excellence in them. This claim is implausible. For I may rightly exclaim, ‘What a lovely butterfly!’, confronted by a less than perfect specimen. Moreover in some cases, such as the starry heavens, any excellence to be found in the object upon deeper investigation may be in a respect quite unconnected with the features of it that first impressed me. But then if an ugly object shares that excellence, why may it not count as beautiful too?

Might a basis for my exclamation be found in the novelty of seeing such a specimen? We are so constituted, claims Reid, that what is new to us commonly gives pleasure upon that account, provided it be not in itself disagreeable. However, if ‘beautiful’ can be properly used in a case of novelty, Reid is in difficulties. For some uses of ‘beautiful’ would not then serve to represent anything in the object.

Reid avoids such difficulties by accepting the common division of the objects of taste into novelty, grandeur and beauty. In order to understand his views on the nature of beauty we should consider his thoughts on grandeur. True grandeur is such a degree of excellence as is fit to raise enthusiastic admiration; it is found originally and properly in certain qualities of mind, and only derivatively in objects of sense. (One immediately wants to ask why it is not a department of beauty.) There is no grandeur in mere matter. There is, according to Reid, a real intrinsic excellence in such qualities of mind as power, knowledge, wisdom, virtue and magnanimity. These in every degree deserve esteem, but in an outstanding degree merit admiration, and lead to imitation of what is admired. When we contemplate such vast objects as the earth, the sea or the planetary system, it seems absurd to deny there is grandeur in them; yet it deserves to be considered whether all the grandeur we ascribe to such objects is not

derived from some qualities of mind of which they are the effects or signs. Thus a great work such as the *Iliad*, is a work of great power, wisdom and goodness, well contrived for some important end; but power wisdom and goodness belong to the work figuratively, being really in its author.

It cannot be without reason that things as different as a flower and a song are called 'beautiful'. The grand is the proper object of admiration. The beautiful is the proper object of love and kind affection. A distinction can analogously be made between original and derived beauty. Original beauty is to be found in certain qualities of mind, such as innocence, gentleness and humanity, which are amiable from their very nature. Knowledge, good sense, wit and cheerfulness draw our love as do many other useful qualities. Clearly Reid needs to establish the claim that what we call beautiful among humankind, inferior animals and the inanimate, are either signs or expressions of such amiable qualities of mind or else the effects of design, art and wise contrivance (see Beauty; Sublime, The).

7 Moral judgment, rights and right bearers

As via the external senses we have both the original conceptions of the various qualities of bodies and the original judgment that this body is hard, so via our moral faculty we have the conceptions of right and wrong and the original judgment that this conduct is right and that conduct wrong. If moral approbation were simply expression of feeling and did not involve moral judgment, then quite ordinary sentences would have either no meaning or one inconsistent with all rules of grammar and rhetoric in all languages throughout all the ages (1788: V.vii).

Reid offers examples of first principles of morals (1788: V. iv and III.iii.6). The latter examples include the maxim that we ought not to do to another what we should think wrong if done to us in like circumstances. Clearly application of the maxim presupposes some basis for distinguishing right from wrong. Happily other examples such as 'no human being is born for themselves only' contain the basis of many more particular familiar moral directives.

Reid does not claim that all persons must perceive the truth of their first principles of morals. The immature may not reach the moral starting points of the mature. Just as we may rely upon the clear and distinct testimony of our eyes concerning the colours and shapes of the bodies around us, so we may rely upon the clear and unbiased testimony of our moral faculty with regard to what we ought to do. But testimony is not invariably satisfactory. Reid (1788: III.iii.6) claims that someone who in a cool moment does not accept the maxim about not doing to another what is unacceptable to us does not possess a moral outlook. He also claims that one can be misled by prejudice and bad example (III.iii.8). Consider someone brought up to pursue injury with unrelenting malice. If they have the virtues of clemency, generosity and forgiveness laid before them, and are in a suitably calm and fair frame of mind, they can come to see, Reid believes, that it is more noble to subdue vengeance than to destroy an enemy. Finally, since the exercise of moral judgment depends on how actions are classified, we cannot expect moral judgments to coincide among people who classify them differently. Reid recognizes the first point when he remarks that our first moral conceptions are probably acquired by attending coolly to the conduct of others, and by observing what moves our approval or our indignation.

The need for moral instruction justifies systematic presentations of morals. Such presentations are not accounts of the structure of the powers of our mind by which we have our moral conceptions and make moral assessments. Reid prefers a presentation in terms of rights - a system of Natural Jurisprudence (1788: V.iii). Whereas a 'right action' is an action conformable to our duty, a 'right' is a technical term from law and covers all that a person may lawfully do, all that they may lawfully possess and use, and all that they may lawfully claim of any other person.

A system of the rights of persons can be as adequate a presentation of morals as a system of their duties. What I have a liberty right to do, it is everyone's duty not to hinder me from doing. What is my property right, no one ought to take from me; or to molest me in the use and enjoyment of it. And what I have a right to demand of any one it is their duty to perform.

However it may be my duty to do a kindness to a person who has no claim of right to it. Here Reid resorts to the notion of an imperfect right. They are not owed the kindness, but it would be a wrong act on the part of the agent not to do them the kindness. Again, if my neighbour possesses a horse which he has stolen, as long as I am ignorant of the theft it is my duty to treat the horse as I would any lawful possession of theirs. Reid seems inclined to allow that the thief has a claim to the stolen goods while the theft is unknown, calling the right 'external'. But

while I indisputably have the duty not to take the horse until the theft is known, the thief's claim is groundless all along.

Reid is clear that the right of liberty extends to what I am obliged to do, to refraining from all unlawful actions and to all actions that are indifferent. The rights of liberty and property are perfect - their violation is an injury. Some claim, citing competitive sports, that Reid should not say (see 1788: V.iii) that it is the duty of all persons not to hinder me from doing what I have the liberty right to do. Clearly, if I parry and thereby thwart your thrust, I have not violated your right to thrust.

Reid holds that, although perfect, the right of property is subject to limitations and restrictions. Thus the right of an innocent individual to the necessities of life is superior to that which the rich individual has to their honestly acquired riches. Reid argues that the Utopian order of society, in which there is no private property, offers the least temptation to bad conduct (see Duty; Rights).

If someone has a limb cut off they are still the same person (1785: III.iv). The limb is no part of that person with a right to a part of their estate. My personal identity implies the continued existence of that indivisible thing which I call myself. Is it immaterial? Reid says that the changes which in common language are consistent with bodily identity differ merely in number and degree from those that are thought to undermine it; whereas personal identity does not admit of degree. Yet he allows that the testimony of witnesses to the identity of a person is commonly grounded on the same factors as our judgments of bodily identity. Nor does he think that the sole means of establishing that there is a permanent self which has a claim to all its thoughts and actions is its memory. Persons are the immediate objects of love or resentment. They are, in that respect, as far from being immediately present to the mind as other external objects.

However, Reid also argues that when I say, I see, I hear, I feel, I remember, this implies that it is one and the same self that performs all these operations. If the faculty of seeing were in the eye, that of hearing in the ear, and so on, the thinking principle, which I call myself, would be not one but many. And Kames is asked in a letter of 1775 (see Reid 1895), whether, given that we say with Joseph Priestley that mental powers are the result of brain structure, several intelligent beings formed out of Reid's brain and having its structure will all be Reid (see Persons)?

8 Common sense and first principles

Reid is not the first philosopher to have argued that since a view is contrary to common sense it should be rejected. But he is among the earliest post-medievals to reflect systematically on that argument (1785:VI). Common sense is that degree of judgment which is common to those members of humankind with whom we can converse and transact business. The same degree of understanding makes one capable of discovering what is true and what is false in matters that are self-evident. What is contrary to common sense is contrary to what is self-evident.

Sometimes Reid's characterizations of self-evidence are fairly neutral. Thus whenever we examine the evidence of any proposition either we find it self-evident, or it rests upon one or more propositions that support it, which, in turn, rest upon propositions that support them. But we cannot go back in this way to infinity. Clearly this can only come to a halt when we reach propositions which support all that are built upon them but are not themselves supported. Sometimes his characterizations serve as marks of self-evidence. One mark is that the principle be expressed in a proposition which is no sooner understood than believed. This runs the risk of fielding only trifling propositions. Another mark is that of an opinion's appearing so early in the minds of people that it cannot be the effect of education or reasoning. But this applies to a great number of beliefs that are simply false, such as the belief that parents know everything that the child wants to know, as well as to others that are true but need justification. Another mark is universality of an opinion, revealed by the tenor of human conduct. This, Reid thinks, will apply to such opinions as the existence of a material world and that there is a right and a wrong in human conduct, and no doubt many others. Another is the indispensability of the belief to our daily conduct of affairs. Yet another is the ridiculous as applied to the contraries of first principles. And, arguably, by the neutral criterion all the deliverances of the senses and of memory are self-evident, although Reid allows that the faculties in question are fallible. Clearly it is far from obvious that just any person with common sense is competent effectively to employ all of these criteria, although that is not to express doubts about their capacity to acquire the competence.

Reid is inclined to withhold the title of 'axiom' from the individual deliverances of the senses since philosophers

call only necessary truths axioms. He divides his candidates for first principles into first principles of necessary truths and first principles of contingent truths. Such principles appear to serve as starting points from which other truths can be derived - necessary truths from the former kind and contingent truths from the latter. But it is not Reid’s view that necessarily true first principles are intrinsically more certain or more surely known than contingently true first principles. Indeed Reid argues (1785: VII) that probable evidence of the highest degree - consisting of an accumulation of different arguments based on first principles of contingent truths - often leads to a degree of assurance as great as fits a proposition of Euclid.

The first principles of contingent truths concerning the reliability of the senses and of memory, of which Reid offers as direct an account as that (1785: III) for the senses, are almost immediate consequences of the principle that our faculties - senses, memory, consciousness and reasoning - are not fallacious.

In reply to a sceptic who objects that we are prone to error, Reid contends that to claim that our faculties are not fallacious is not to say that they are infallible; only by using them can we establish anything at all, including their proneness to error. But that our faculties are not fallacious is not something that can be established by using them; it is rather a presupposition of their use.

Another sceptic might resolve to withhold assent to anything until it is established that our faculties are not fallacious. Reid remarks that it would be impossible to move them out of this position by argument. Indeed, it is not possible to enter into a dispute with someone who does not share our first principles. For the procedure by which the truth of a proposition is discovered, or its falsehood detected, is to show its necessary connection with first principles or its incompatibility with them; hence one cannot reason with someone who denies one’s first principles. Indeed, if many key terms are implicitly defined by acceptance of first and derived principles it is hard to see how we can even communicate with someone who does not share our first principles.

It might be thought that Reid’s view that first principles are the voice of God should be taken as a possible justification for adhering to them, or for thinking them true. But if it is not self-evident that they are from God (even if it be evident that their acceptance is, in some instances, a part of human nature), it requires use of our faculties to establish the point that they are from God. Only then can that point be used on behalf of their acceptability.

Reinach, Adolf (1883-1917)

Adolf Reinach, a German philosopher of Jewish extraction, was born in Mainz and died on the battlefield in Flanders. He is of principal note as the inventor, in 1913, of a theory of speech acts (or 'social acts' to use Reinach's own terminology) which in some respects surpasses the later work of thinkers such as J.L. Austin and Searle. Reinach was a leading member of the so-called Munich-Göttingen school of phenomenologists who were inspired by Husserl's early realism and who rejected Husserl's subsequent turn to 'transcendental idealism', drawing their inspiration rather from the more analytic orientation of thinkers such as Franz Brentano and other Austrian philosophers.

1 The legal a priori

Reinach and his fellows conceived phenomenology as a method for describing the 'essential structures' manifested in different realms of objects of experience, in terms of the dependent and independent parts and moments which are the constituent elements of such structures (see the third of Husserl's *Logical Investigations* (1900-01)). This method led Reinach to embrace an extreme version of 'apriorism' in legal theory. All creations of positive law, according to Reinach, presuppose certain basic legal or institutional categories prior to any human convention and subject to certain 'material a priori laws', laws which would obtain even though never recognized by any human subject. Examples of such laws are: a promise gives rise to a mutually correlated claim and obligation; a promise gives rise to a defeasible tendency on the part of the promiser to fulfil the content of the promise. Such laws are analogous to the a priori laws which obtain in other spheres - for example, laws to the effect that nothing can be red and green all over, that red is darker than orange, and so on. Only against the background of this fabric of basic legal structures and associated laws, Reinach argues, can we understand the peculiar phenomena of convention and of positive law-making - phenomena whereby uses of language give rise to certain real changes in the legal and institutional world.

2 Promises and other acts

That uses of language not only can, but even normally do, have the character of actions was a fact largely unrealized by those engaged in the study of language before the present century, not least in virtue of the influence of Aristotle, who in *De Interpretatione* (17a1-5) relegates the study of non-statement-making sentences to the disciplines of rhetoric and poetry. The first philosopher to have fought against the Aristotelian conception seems to have been Thomas Reid, who saw that in addition to judgments there are also other types of sentence permitting of a theoretical treatment (see Schuhmann and Smith 1990). Reid's remarks on social acts were, however, uninfluential, and it was not until the end of the nineteenth century that the idea of linguistic action began to rear its head once more, in the tradition initiated by Brentano and Husserl. Brentano defended the thesis that all mental acts are intentional - that is, that they are directed towards some precisely tailored object. Husserl exploited this thesis in the *Logical Investigations*, above all in the principle: every intentional experience is either an objectifying act or is dependent upon such an act for its existence. Non-objectifying acts such as feelings and emotions, Husserl held, need objectifying acts to supply them with their objects.

Husserl's theory of linguistic meaning is based on this theory of objectifying acts. For Husserl all uses of language approximate to referential uses. More precisely: all expressions are associated either with nominal acts or with acts of judgment. How, on this basis, can Husserl account for the meaningfulness of uses of language involved in asking questions, issuing commands, expressing requests, and so on? Answer: by conceiving the corresponding utterances as disguised statements about certain associated experiences on the part of the language-using subject. The command 'Sit down on the chair!', for example, is a disguised statement to the effect that 'your sitting down on the chair is my current request'. It was in response to the perceived inadequacies of this position that Reinach formulated his theory of social acts.

3 The theory of social acts

The rejection by the Munich phenomenologists of Husserl's theory of linguistic meaning was a cumulative process, instigated by Johannes Daubert (1877-1947) and culminating in the theory of speech acts put forward by Reinach in his monograph on *The A Priori Foundations of the Civil Law* (1913). On the traditional account the

action of promising is seen as the expression of an act of will or as the declaration of an intention to act in the interests of the promisee. Such an account, however, throws no light on how an utterance of the given sort can give rise to a mutually correlated obligation and claim. The bare intention to do something has, after all, no quasi-legal consequences of this sort, and it is difficult to see why things should be different just because such an intention is brought to expression in language.

Both promising and communicating one’s intention to do something, according to Reinach, belong to the category of what he calls ‘spontaneous’ acts - that is, acts which involve a subject’s bringing something about within his own psychic sphere, as contrasted with passive experiences of, say, feeling a pain or hearing an explosion (Reinach [1913: 706] 1983: 18). Certain specific types of spontaneous acts require as a matter of necessity a linguistic utterance or some other overt performance of a non-natural (rule-governed) sort. This does not hold of judging or deciding, nor even of forgiving, but it does hold of apologizing, commanding, accusing. We may accordingly divide spontaneous acts into two classes, which we might call ‘internal’ and ‘external’, according to whether the act’s being brought to overt expression is a separable or inseparable moment of the relevant complex whole.

Acts are divided further into self-directable and non-self-directable. Self-directable acts are such that the subject towards whom they are directed may be identical with the subject of the act (as in cases of self-pity, self-hatred and so on). Non-self-directable acts, on the other hand, such as forgiving or praying, demand an alien subject. A peculiarity of certain external and non-self-directable acts is that the relevant utterance must of necessity not only be directed towards a certain subject but also registered or grasped by this subject in a further act: a command must be received and understood by those to whom it is addressed (something which does not apply, for example, to an act of blessing or cursing). What has been said of commands holds also for requests, admonishments, questionings, informings, answerings, and many other types of act (Reinach [1913: 707] 1983: 19). Each such ‘social’ act constitutes a unity of deliberate execution and utterance; the utterance is not something added as an incidental extra. Certainly there exist also incidental statements relating to social acts: ‘I have just issued the command’. But such statements then relate to the whole social act, with its external aspect, as an independent unity (Reinach [1913: 708] 1983: 20).

The closeness to J.L. Austin and later speech act theorists is unmistakable. For Reinach, as for Austin, a promise is not just the expression of an act of will; it is a social act with an essential external dimension embracing utterance and execution (see Austin, J.L. §3). Reinach’s treatment of social acts includes also an account of conditional acts, of sham and incomplete and otherwise defective acts, of acts performed jointly and severally, and of that sort of impersonality of social acts that we find in the case of legally issued norms and in official declarations such as are involved in marriage and baptismal ceremonies (see Speech acts).

Reinach’s theory is embedded within a larger theory of legal formations and includes a subtle treatment of the ways in which basic legal categories may become modified in their instantiations as a result of the contingent and pragmatically motivated issuances of the positive law. It is embedded also within a larger (non-Kantian, ontological) theory of the a priori, on the one hand, and of the relation between is and ought, as well as between linguistic phenomena and legal and ethical and institutional phenomena, on the other. His brilliance and originality were greatly admired by early phenomenologists, including Husserl himself, but his influence was cut short by an early death and by a shift of direction in the phenomenological movement away from the logico-linguistic, ontological and psychological concerns manifested by Husserl himself and by his earliest followers in Munich and Göttingen.

Reincarnation

The doctrine of reincarnation teaches that each human being has been born and died, and again been born and died, over and over again in a beginningless process that will never end unless they become enlightened. The doctrine of karma asserts that right and wrong actions bring, respectively, positive and negative consequences. For monotheistic religious traditions that accept reincarnation and karma, each person beginninglessly depends on God, and karmic consequences are under God's providential control; repentance and faith may lead to God graciously cancelling negative consequences. Nonmonotheistic religious traditions that embrace reincarnation and karma doctrine see karma as operating in terms of what is, in effect, a moral version of natural or causal law. Both sorts of religious tradition view escape from the reincarnation cycle - 'the wheel' - as the ultimate goal of one's existence and as possible only if one can escape from having karmic consequences still coming at one of one's deaths. Monotheistic traditions see escape as continuance of personal identity, and living in the presence of God (as in monotheistic Hinduism). Nonmonotheistic traditions range from seeing escape as continuance of personal identity in a disembodied condition of omniscience (Jainism, an atheistic religion), loss of all personal identity in entering a changeless nirvāṇa, *or annihilation of all undesirable states but continued existence composed of only desirable states (as in different Buddhist traditions), or simply the realization of identity with a qualityless ultimate reality, so that there only apparently are either persons or reincarnations (as in Mahāyāna voidism and Advaita Vedānta).*

1 Karma and Brahman

Karmic consequences accrue over lifetimes. A right or wrong action performed by an agent *A* in one lifetime may only result in consequences to *A* in *A*'s next lifetime or in *A*'s next lifetime plus one, or later still. One's circumstances of birth (one's sex, caste, economic status, place in society, health, psychological structure, and so on) are functions of one's karmic history. While popularly humans are thought sometimes to be reborn as animals, scholarly Hindu tradition tends to take the idea of a person being reborn as something other than a person as underlining the importance of acting rightly, and accounts of human persons being reborn as animals as stories warning against wrong actions, not literal accounts of the future fate of wicked people.

Within Hindu monotheistic traditions, Brahman or God is held to superintend the reincarnation cycle and its karmic distributions; karma is thought of as God's way of acting justly, parcelling out the appropriate rewards for right action and punishments for misdeeds. Further, repentance of one's sin and trust in God's forgiving mercy is held to provide a way of escape from one's bearing the full brunt of one's negative karma, as well as from the cycle of reincarnation (see Brahman; Karma and rebirth, Indian conceptions of).

Nonmonotheistic South Asian (Indian) traditions - Jainism and, in so far as it takes reincarnation and karma literally, Buddhism - of course have no notions of divine forgiveness or of God providing release from the wheel of rebirth. Their account of what makes escape possible is that if one becomes enlightened in a given lifetime, this signals that at the moment of enlightenment one is free both from karmic credit and karmic debit. Taking one's life would be wrong, so following enlightenment by suicide is not regarded as a solution. One can keep oneself from deserving negative consequences in a future life by not acting wrongly. It is possible, we are told, to perform right actions in a way that does not bring positive consequences, namely by performing them disinterestedly, without emotional investment in their outcome. Thus by maintaining a detached attitude regarding right actions and avoiding wrong actions, an enlightened person can avoid piling up further karmic credits and debits. 'Becoming enlightened' for these traditions is a matter of having an esoteric religious experience; such an experience is a pre-*nirv(ṇa* state - an event in one's current lifetime that promises final *nirv(ṇa* at this lifetime's end (see Nirvāṇa).

2 The importance of escape

One might consider the doctrines of reincarnation and karma as exceedingly good news, since if they are true then apparently one could improve one's overall lifestyle and status by being a morally decent person until one reached a lifetime in which one enjoyed highly satisfactory circumstances. Then, one might think, one could maintain that level of happy life while being born into various healthy bodies and living in sundry pleasant surroundings. Yet any such entrepreneurial alternative is universally rejected by the reincarnation and karma traditions.

There are two reasons why the entrepreneurial perspective is nowhere taken in Indian thought. The more superficial reason is that the nature of reincarnation is not such as to allow one, in one lifetime, to make an efficacious decision regarding one's moral efforts in all future lifetimes. Thus one's decision now to be decent ever after, even if it holds for one's current lifetime, does not guarantee that one will make a similar choice the next time around or guarantee the effectiveness of that new choice should it be made. The more important reason is that human existence within the reincarnation cycle is itself held not to be worthy of one's continued attachment. A Hindu text reads as follows:

> In this body, which is afflicted with desire, anger, covetousness, delusion, fear, despondency, envy, separation from the desirable, union with the undesirable, hunger, thirst, senility, disease, sorrow, and the like, what is the good of the enjoyment of desires…we see that this whole world is decaying…. In this sort of cycle of existence, what is the good of the enjoyment of desires, when after a man has fed on them there is seen repeatedly his return here to earth?… [I]n this cycle of existence I am a frog in a waterless well.
>
> (Maitri Upaniṣad, I, 3-4)

It is basic Theravāda Buddhist doctrine that this world is a place of suffering and 'unsatisfactoriness'. No unenlightened state that a human can be in is satisfactory or worthy of being clung to. The basic religious problem is that of escaping the round of birth and rebirth, and the way to do so is through enlightenment. Theravāda, and Indian Buddhism generally, is nonmonotheistic; there is no doctrine of a creator and providence, and what gods and goddesses there may be are themselves involved in the reincarnation cycle and seeking their own way out.

3 Persons and enlightenment

The Theravāda Buddhist account of what a person is contends that *at* a single time a person is nothing more or other than a bundle of nonconscious and conscious, or physical and mental, states; *over* time a person is nothing more or other than a series of such bundles. An individual person is a set of elements, each momentary and transitory, and everything else is made up of momentary, transitory states. Much of the intellectual context within which Buddhism developed held that each person (*ātman*) is a mental substance that endures throughout its reincarnation history and (should that person become enlightened) on into the enlightenment state. It also held that Brahman is a supreme person who exists everlastingly, is not subject to reincarnation or karma, and gives aid in escaping the reincarnation cycle to those who seek it. For the Buddhist (save for a heretical personalist school) there is no enduring self (*ātman*), nor is there an unchanging ultimate reality (Brahman). It is basic Buddhist doctrine that nothing noncomposite endures even two moments; everything is impermanent. The person, or self, of everyday experience - the 'empirical self' - is held to be unreal or illusory, since we ordinarily or commonsensically take ourselves to be enduring self-conscious things - mental substances - and Buddhist doctrine is adamantly nonsubstantialist. For the Theravādin, there is only a stream of successive, causally linked bundles of momentary physical and mental states. Later Indian Buddhism, for example Mahāyāna, retains the structure of this analysis, but, as an idealist tradition, rejects the view that there are physical states. Causal and (potential) memory connections link one series of bundles in one lifetime to another series in another to constitute reincarnation. Reincarnation is simply a matter of this stream continuing.

If one becomes enlightened, one has a pre-*nirv(ṇa* experience in which one learns the truth concerning 'impermanence' and 'selflessness'; final, postmortem *nirv(ṇa* is the cessation of even this transitory self with consequent release from all desire and unsatisfactoriness. For the Theravāda tradition, the goal is simply to achieve *nirv(ṇa*, and no one who has the sort of pre-*nirv(ṇa* experience that makes final *nirv(ṇa* an option could rationally turn down reaching the final goal upon death. The Mahāyāna tradition, however, holds that one who becomes enlightened in the sense of attaining the relevant pre-*nirv(ṇa* state will put off achieving *nirv(ṇa* upon death and opt to return to the reincarnation cycle in order to help others become enlightened. Final *nirv(ṇa* will be accepted by such a person only when everyone has become enlightened, a condition that for some schools is far off and for others will never arise. Other Mahāyāna schools hold 'voidist' doctrines and contend that even the doctrines of reincarnation and karma presuppose the existence of distinct elements, whereas all reality is seamless; since no distinction that can be made corresponds to anything real, there is no reincarnation cycle and no karma, and coming to see that all is void is *nirv(ṇa* (see Buddhist concept of emptiness).

The Jaina tradition holds that 'modifications cannot exist without an abiding or eternal something - a permanent

substance' (Radhakrishnan and Moore 1957: 269). A 'substance' in this sense is something that has qualities, is not itself a quality or a bundle of qualities, remains the same through change, and endures over time; indeed, on the Jaina view, a substance is indestructible. On this account, then, persons are mental substances, self-conscious souls whose existence neither begins nor ends. The participation of a soul in the reincarnation cycle involves its embodiment, with the undesirable consequence that its inherent omniscience is not realized and it appears to itself to be destructible. By achieving an esoteric religious experience, one can come to a true notion of one's personhood and, upon one's next death, attain *nirv(ṇa*. Both embodiment and karmic consequences, positive and negative, become things of the past, and, with full retention of personal identity (remaining numerically the same self-conscious substance that one has always been), one is freed from all errors and need never return to the wheel. For the Jaina, then, there is an infinite number of real (nonillusory) things which are eternally distinct from one another. Most important among these distinct things are persons (souls, *jīvas*), who can attain enlightenment in which their inherent omniscience is no longer dimmed by embodiment and their individuality is not lost but enhanced. Though the Jainas believe in individual immortality, they do not believe in a supreme deity.

Advaita Vedānta is a nonmonotheistic, monistic variety of Hinduism, according to which only Brahman without qualities exists (see Vedānta). Each person (*ātman*) is identical to the qualityless Brahman. Freedom from the reincarnation cycle involves coming to see that this identity holds. For the Advaitin, ultimate reality (that which does not depend on anything else for its existence) is apersonal and eternal, unchanging and permanent. The real self is identical to this ultimate reality and in a this-life esoteric religious experience, one learns this truth, thereby escaping the cycle of rebirth, losing all individuality, and being 'absorbed' into Brahman. There are obvious similarities between Buddhist 'voidism' and Advaita Vedānta, as was noted by those Hindus who accused Śaōkara, perhaps the greatest of Advaita Vedānta thinkers, of being a crypto-Buddhist. Critics of Advaita Vedānta have argued that if reincarnation and karma are illusions, then there must be someone whose illusions they are, and since by nature Brahman cannot be subject to illusion there must be persons who are not identical to Brahman.

Reincarnation and karma doctrines, then, vary as notions of what a person is and what is ultimately real vary. Agreement on the desirability of escape from the cycle of reincarnation coexists with quite different notions of what sort of thing is in the cycle, what exactly the cycle is and whether the cycle is itself guided by an intelligent and gracious hand.

4 Reincarnation and evil

It is sometimes said that the doctrines of reincarnation and karma make it clear why there is evil in the world and why apparently innocent people suffer. A baby born with disease or defect cannot deserve its fate due to anything it has done in its lifetime. Very bad things happen to very good people and very good things happen to very bad people in ways that seem quite unjust in the light of their current conduct and character. The 'luck of the draw' regarding one's family, intelligence, social status, economic position and the like can powerfully affect the degree to which one is healthy and happy. Wellbeing seems poorly correlated with personal merit or character. In sum, the world plainly seems not to be characterized by a just distribution of goods or of (what might be seen as) rewards and punishments.

If the doctrines of reincarnation and karma are true, however, each person now reaps what they have sown in the past. One deserves whatever one gets, though perhaps not because of anything one has done in one's current lifetime. If a person exists before each of their embodied lifetimes, then the conditions of embodiment and the pleasures and sufferings they undergo may reflect their character in previous lives; so the apparently unjust distribution of goods, or of rewards and punishments, may in fact be exquisitely matched to their deserts.

The claim is that whatever circumstances a person is born into, and whatever befalls that person, are what is morally appropriate in the sense that they are the sort of circumstances and consequences that a morally perfect being, fully informed and capable, would provide them with. For the monotheistic reincarnation traditions, things are this way precisely because such a being has so acted; for the nonmonotheistic traditions, the universe is so structured that this happens by law.

On this account, a person's life-conditions in a given lifetime are a function of their moral conduct and character in a previous lifetime, and so on back forever. The resulting situation is perfectly analogous to that in which the existence of one dependent thing is explained by reference to another, and that to another, without ever coming to

anything that exists independently. In this latter case, one always has, by hypothesis, an answer to ‘What caused this particular thing to exist?’ but never, in principle, an answer to the question ‘Why does anything at all exist?’ In the former (reincarnation and karma) case, there is always, by hypothesis, an answer to the question ‘Why does this particular evil exist?’ but never, in principle, an answer to the question ‘Why is there any evil at all?’ The reincarnation and karma explanation simply assumes the existence of evil, and then goes on to present its blueprint for explaining the fact that evils are distributed as they are. Of course, it involves the general claim that there are such explanations without providing specific explanations in particular cases. Hence no explanation of the fact of evil is forthcoming from a reincarnation and karma perspective.

Reinhold, Karl Leonhard (1757-1823)

A catalyst in the rise of post-Kantian idealism, Reinhold popularized Kant's critical philosophy by systematizing it in the form of a theory of consciousness. Reinhold shifted from one position to another, however, each time declaring his latest philosophical creed as ultimate. For this he was ridiculed by his more famous contemporaries, including Fichte, Schelling and Hegel, and his historical reputation suffered accordingly. Recent re-evaluations, however, suggest that there was considerable coherence to his philosophical wanderings.

A sometime priest who converted to Protestantism, active freemason and popular teacher, Reinhold advocated political intervention in the promotion of enlightened practices. He steadfastly defended the French Revolution.

A secret promoter of the Austrian Enlightenment while still a priest and monk in Vienna, Reinhold eventually left the Church and fled to Protestant Germany in 1783. There he continued his campaign against 'monkish' obscurantism, mostly in C.M. Wieland's journal, *Der Teutsche Merkur*. Appointed to the chair of Kantian philosophy at Jena in 1787, he later took up a professorship in Kiel (1794), where he remained - popular teacher and voluminous writer - to the end.

In 1784 Reinhold defined the Enlightenment as the effort to accelerate through political and educational means the otherwise slow natural advance of the masses towards rational life. This advance, though retarded by priestly and political reaction, is unstoppable. It is also subject to an inner logic discernible in the history of metaphysics - itself only a reflective, specialized expression of common sense. But metaphysics, Reinhold later repeatedly declared, had run the full gamut of logically possible one-sided views concerning truth. The time was therefore ripe for the revelation of the one true position that would reconcile all past ones.

In 1786-7, this belief led Reinhold, in the midst of the Jacobi-Mendelssohn dispute (see Jacobi, F.H. §2), to portray Kant as the philosopher who, in response to the needs of the time, had cut across old dividing lines with a few new and bold distinctions. Kant was therefore capable of reconciling such extreme opposites as Mendelssohn's rationalism and Jacobi's faith, thereby satisfying the full aspirations of common sense (see Kant, I. §4; Mendelssohn, M. §1).

Reinhold drew this portrait of Kant in *Der Teutsche Merkur*, in eight 'Kantian Letters' which won immediate popularity for critical philosophy and notoriety for himself. However, since Reinhold held that truth cannot but be recognized and accepted as such by all immediately upon display, he had to explain the failure of critique to win universal following. The reason was that Kant - a pioneer - had neither declared his principles explicitly nor systematized his philosophy accordingly. To remedy this failure, in 1789 Reinhold developed a theory of the faculty of representation in which he expounded Kantianism in 88 propositions, all based on a statement of supposedly the most simple fact of consciousness, to wit: 'Representation is distinguished in consciousness by the subject from both subject and object, and is referred to both' (*Beyträg* 1790: 167). Reinhold's new theory, though presented as a systematization of Kant's position, differed from it substantially. Behind its veneer of deductions, it was a description of presumed facts of consciousness - a phenomenology rather than critique. Moreover, Reinhold introduced a form-content distinction at every representational level, and explained each level as the product of a reflection upon a more elementary one - the 'form' in one providing the 'content' of the next.

In two volumes of essays (1790-4) Reinhold sought to refine his *Elementarphilosophie* (Philosophy of the elements), as his theory came to be known. There, and in the second of two other volumes of new 'Kantian Letters' (1790-2) the first incorporating the original eight), he also reacted to recent attacks on critical moral theory. He rejected Kant's identification of 'will' with 'reason', and sought to establish in the faculty of choice the basis of 'personality'. However, Reinhold's efforts in the promotion of Kantianism proved counterproductive, precipitating G.E. Schulze's successful sceptical attack on critical philosophy in 1792.

But Reinhold began to study Fichte's new *Wissenschaftslehre* (which his own theory had influenced) and, for a brief period, even declared himself for it (1797) (see Fichte, J.G. §3). He then tried, in 1799, to position himself between Jacobi and Fichte by defining philosophy as the artificial (religiously neutral) conceptual reconstruction of truths already possessed through faith, only to turn his attention to the 'rational realism' of C.G. Bardili. Bardili held that it is possible by means of a reflection upon pure thought to establish the first predicates of 'being as

such', and the necessity of a First Being. But the abstract categories thereby obtained only yield a science of nature when applied to a matter that must be presupposed independently of all thought. Reinhold refined and defended this dualism in six volumes of essays (1801-3). After 1800, however, he gravitated ever closer to Jacobi, criticizing idealism and expressing sympathy for the synthesis of empirical and critical elements which younger philosophers such as F. Bouterwek, in part inspired by Jacobi, were formulating. Reinhold accepted Jacobi's claim that the first access to truth is through faith, but staunchly defended reason's independent ability to grasp and express this truth scientifically.

Reinhold sided with Jacobi in the latter's final attack on Schelling (see Jacobi, F.H. §3). In 1812, inspired by Jacobi and indirectly by the later J.G. Hamann (§2), he tried his hand at a meta-critique of reason by means of an analysis of language. He attributed all past philosophical errors to confusions (to which reason is held hostage) which are inherent in accepted usages of language. Critique must dispel these confusions. Accordingly Reinhold identified eight 'families of words', in an effort to define the relations of meaning that obtain within each and the irreversible (linear and non-dialectical) order connecting one group to the other. True to his Enlightenment heritage, Reinhold assumed that underlying language is a natural system of universal meanings which now lie hidden under the sedimentation of historically determined usages, but which, once brought to consciousness as they inevitably shall, cannot but be universally recognized and accepted.

Relativism

Someone who holds that nothing is simply good, but only good for someone *or from a certain point of view, holds a relativist view of goodness. Protagoras, with his dictum that 'man is the measure of all things', is often taken to be an early relativist. Quite common are relativism about aesthetic value, about truth in particular areas such as religious truth, and (arising from anthropological theory) about rationality. There are also a number of ways of answering the question 'relative to what?' Thus something might be said to be relative to the attitudes or faculties of each individual, or to a cultural group, or to a species. Relativism therefore has many varieties; some are very plausible, others verge on incoherence.*

1 Grades of relativism

What people believe is affected by their circumstances. A twentieth-century business executive will probably not hold the same views on morality as a medieval peasant, nor a medieval monk the same views on the nature of the physical world as a twentieth-century physicist. An Indian is unlikely to have the same religious opinions as an Italian. This rather commonplace point is hardly exciting enough to deserve the name of 'relativism'. Admittedly, some have concluded from it that there is no one truth about these things, only what seems true from certain perspectives. This argument has proved especially appealing in the case of morality, but it is quite certainly invalid. From the fact that two people hold (even predictably hold) different opinions on a question, it does not follow that there is no truth of the matter - only that, if there is, at least one of them has got it wrong.

But at least the idea that there is no one truth about things sounds closer to something which we might pointfully call 'relativism'. And perhaps there are in some cases (morality looks, *prima facie*, a more promising candidate than physics) better reasons for believing it than this crude and manifestly invalid reasoning. For suppose two people each set themselves to think of a moral code, conformity to which will, in their differing cultural and economic environments, result in as much good as possible - may we not expect that the codes will differ? In widely differing circumstances, the same practices may have widely differing results.

The (moral) relativism which this argument yields is still a rather dilute one. It is fully compatible with there being utterly objective moral principles on which both our protagonists agree. The difference arises only when each asks what these principles dictate when applied to their own situation. Similarly, we can imagine circumstances in which certain procedures were irrational (in the sense of being unlikely to lead to true beliefs) which are rational in ours. In a society whose members were much more wary and suspicious of strangers than they are in our own, it might be irrational to believe information from anybody one does not know. Again, the (epistemic) relativism here is superficial.

A fully-blown relativism denies that there is any such deeper unity beneath the diversity. There is simply what *they* consider right (or rational), and what *we* consider right, what passes for true among them, and what so passes among us.

2 The credibility of relativism

Relativism in its strong form is a version of anti-realism, and how credible it is will depend very much on what we are asked to be relativists about (see Realism and antirealism). Few will have difficulty about 'gastronomic relativism': whether peaches taste nice or not is just a matter of how individuals respond to eating peaches. Many will not object to relativism about colour, according to which the colour of something is a matter of how an observer's visual system responds to it (see Secondary qualities). Even if this does involve accepting that in some sense grass is not 'really' green, we can still react to colours, enjoy certain combinations of colour, attach emotive associations to colours, stop at red traffic lights, and in short go on as we always have.

With moral relativism things are more difficult. To hold that something is wrong for you, or in your society, but perfectly permissible for someone else, or in their society, and that *that is all there is to be said about it*, comes very close to giving up one's own moral view. Are you really to think that there is nothing morally objectionable going on in that other society, just because it is that society? How are you to judge its members if their conduct comes to affect you? An uninvolved Olympian spectator (this may be why relativism sometimes seems easier while we are philosophizing!) might be able to see that there is no more to it than the different reactions and

feelings of members of the two societies, but whether that can be believed from within the melée - even if it is actually true - is quite a different question.

Trickier still is the relativist doctrine that ‘true’ always really means ‘true-by-the-standards-of-X’, where X is some individual or group. An example might be a theory which understands truth in terms of what it is satisfactory to believe (see Truth, pragmatic theory of). Such a theory allows that truth may differ from group to group or from person to person, since social conditions, and individual psychology, may affect the satisfaction to be had from a given belief. Proponents of this kind of theory face various problems: have they anything at all to say to someone who questions whether the standards adopted by their chosen X are good ones? And are they offering their theory of truth as being itself true, or merely ‘true-by-the-standards-of-X’?

One response, favoured by many postmodernists, is to flit ironically from perspective to perspective, espousing none (see Postmodernism). Another response would be to say nothing. How many postmodernists have adopted this latter alternative is, from the nature of the case, hard to determine.

Relativity theory, philosophical significance of

There are two parts to Albert Einstein's relativity theory, the special theory published in 1905 and the general theory published in its final mathematical form in 1915. The special theory is a direct development of the Galilean relativity principle in classical Newtonian mechanics. This principle affirms that Newton's laws of motion hold not just when the motion is described relative to a reference frame at rest in absolute space, but also relative to any reference frame in uniform translational motion relative to absolute space. The class of frames relative to which Newton's law of motion are valid are referred to as inertial frames. It follows that no mechanical experiment can tell us which frame is at absolute rest, only the relative *motion of inertial frames is observable. The Galilean relativity principle does not hold for accelerated motion, and also it does not hold for electromagnetic phenomena, in particular the propagation of light waves as governed by Maxwell's equations. Einstein's special theory of relativity reformulated the mathematical transformations for space and time coordinates between inertial reference frames, replacing the Galilean transformations by the so-called Lorentz transformations (they had previously been discovered in an essentially different way by H.A. Lorentz in 1904) in such a way that electromagnetism satisfied the relativity principle. But the classical laws of mechanics no longer did so. Einstein next reformulated the laws of mechanics so as to make them conform to his new relativity principle. With Galilean relativity, spatial intervals, the simultaneity of events and temporal durations, did not depend on the inertial frame, although, of course, velocities were frame-dependent. In Einstein's relativity the first three now become frame-dependent, or 'relativized' as we may express it, while for the fourth, namely velocity, there exists a unique velocity, that of the propagation of light* in vacuo, *whose magnitude c is invariant, that is, the same for all inertial frames. It can be argued that c also represents the maximum speed with which any causal process can be propagated. Moreover in Einstein's new mechanics inertial mass* m *becomes a relative notion and is associated via the equation* $m = E/\mathrm{c}^2$ *with any form of energy* E. *Reciprocally inertial mass can be understood as equivalent to a corresponding energy* $m\mathrm{c}^2$.

In the general theory Einstein ostensibly sought to extend the relativity principle to accelerated motions of the reference frame by employing an equivalence principle which claimed that it was impossible to distinguish observationally between the presence of a gravitational field and the acceleration of a reference frame. Einstein here elevated into a fundamental principle the known but apparently accidental numerical equality of the inertial and the gravitational mass of a body (which accounts for the fact that bodies move with the same acceleration in a gravitational field, independent of their inertial mass). By extending the discussion to gravitational fields which could be locally, but not globally, transformed away by a change of reference frame, Einstein was led to a new theory of gravitation, modifying Newton's theory of gravitation, which could explain a number of observed phenomena for which the Newtonian theory was inadequate. This involved a law (Einstein's field equations) relating the distribution of matter in spacetime to geometrical features of spacetime associated with its curvature, considered as a four-dimensional manifold. The path of an (uncharged spinless) particle moving freely in the curved spacetime was a geodesic (the generalized analogue in a curved manifold of a straight line in a flat manifold).

Einstein's theories have important repercussions for philosophical views on the nature of space and time, and their relation to issues of causality and cosmology, which are still the subject of debate.

1 The Lorentz transformations

Consider two inertial reference frames *K* and K', where the spatial origin of the K'-frame moves along the positive *X*-axis with velocity *v* as viewed from the *K*-frame. If we introduce Cartesian spatial coordinates *x*, *y*, *z* and a time coordinate *t* to locate some arbitrary event relative to the *K*-frame, and similarly use x', y', z' and t' to locate the event relative to the K'-frame, where we suppose the spatial axes are parallel in the two frames, and the origins of the frames coincide at time $t = t' = 0$, then the classical Galilean transformations (see Mechanics, classical §1) read:

$$to\mathrm{x}' = x - vty' = yz' = zt' = t(1)$$

The corresponding Lorentz transformations of special relativity are:

$to x' = \frac{1}{\sqrt{1-v^2/c^2}}(x-vt) y' = y z' = z t' = \frac{1}{\sqrt{1-v^2/c^2}}\left(t - \frac{vx}{c^2}\right) (2)$

where c is the magnitude of the velocity of light *in vacuo*.

For sufficiently small values of v/c the Lorentz transformations are approximately the same as the Galilean transformations.

Einstein argued for (2) by considering the propagation of a spherical light wave centred on the origin of the *K* and K' frames at the time $t = t' = 0$. He employed two principles:

(i) the ‘light constancy principle’, that the velocity of light was a constant independent of the motion of the source; and
(ii) the ‘special principle of relativity’, that the laws of nature are invariant (take the same form) in all inertial reference frames.

From (i) and (ii) Einstein inferred:

(iii) the ‘light invariance principle’, that the velocity of light was the same in any direction and had the same numerical magnitude as viewed from the *K* and K'-frames.

By invoking various other ‘homogeneity’ and ‘symmetry’ properties of space and time, Einstein proceeded to derive the Lorentz transformation equations. Since Einstein’s 1905 paper there have been many other derivations of the Lorentz transformations from various combinations of plausible principles. In particular it has been argued that the principle of relativity only licences a weak form of the light invariance principle, committed just to invariance of the shape of the light wave, not also the magnitude of the light velocity, but it turns out that the Lorentz transformations can still be derived without invoking the strong form of the light invariance principle. Returning to Einstein’s own derivation, the light constancy principle already follows from assuming that light propagates in accordance with Maxwell’s equations (see Maxwell, J.C.; Optics §1; Electrodynamics), and the light invariance principle would follow from assuming the invariance of Maxwell’s equations. But Einstein did not want to assume the full validity of Maxwell’s equations, but rather to base his relativity theory on specific principles that he thought would survive possible alterations to Maxwell’s theory that would be engendered by the quantum theory.

It is easily checked that the light invariance principle is satisfied by the Lorentz transformation equations, whereas the Galilean transformations clearly violate it. It also turns out that the full set of Maxwell’s equations *are* invariant under the Lorentz transformations although, as we have just mentioned, this was not built into Einstein’s derivation.

H. Minkowski (1909) gave a geometrical interpretation of the Lorentz transformations in terms of a four-dimensional geometry equipped with an indefinite metric, which defined the four-dimensional interval between two punctiform events located at x_1, y_1, z_1, t_1 and x_2, y_2, z_2, t_2 relative to the *K*-frame as:

$$s = (t_2 - t_1)^2 - \frac{1}{c^2}\left[(x_2 - x_1)^2 + (y_2 - y_1)^2 + (z_2 - z_1)^2\right]$$

The events are said to be time-like separated, light-like separated, or space-like separated according as *s* is greater than zero, equal to zero or less than zero.

The metric corresponding to this interval is said to have Lorentzian signature, which distinguishes it from a four-dimensional *Euclidean* space, where the interval would be positive definite.

The interval between two events is then invariant under the Lorentz transformations. That $s = 0$ corresponds to the fact that the two events are connectable by a light signal. Time-like separated events are connectable by a signal travelling slower than light, while for space-like separated events they can only be connected by signals travelling faster than light. If we adopt a limiting velocity principle and take the velocity of light *in vacuo* to be the maximum velocity with which any signal can be propagated, then space-like separated events cannot be connected by a signal. The status of the limiting velocity principle *vis-à-vis* the light invariance principle will be discussed in §3.

If connectibility by a physically propagating signal is identified with causal connectibility, then the causal structure imposed on events in Minkowski spacetime comprises a double light-cone constructed at any point *P* in spacetime which divides the whole of spacetime into the locations of three classes of event: those that can be causally influenced by an event at *P*, bounded by the future-directed light-cone; the events which can causally effect an event at *P*, bounded by the past-directed light-cone, points on the light-cone being connectable with *P* by light signals; while the third region comprises the locations of events external to the light-cone, which are causally isolated from an event at *P* (see Spacetime §2). These facts about Minkowski spacetime have been employed by philosophers such as Hans Reichenbach and Adolf Grünbaum to provide a causal underpinning for Einstein's light invariance principle (see §3).

2 The relativity of simultaneity, duration and length

From the point of view of the Galilean transformations all inertial reference frames agree on which events are simultaneous with one another. The simultaneity relationship is an equivalence relation which partitions the set of all actual and possible events in spacetime into equivalence classes, which are indexed by the absolute time at which they occur. Absolute time can be understood as the linearly ordered quotient set associated with this equivalence relation, corresponding to Leibniz's order of succession, while the equivalence classes themselves, the spatial slices at a given time, correspond to Leibniz's order of coexistence (see Leibniz, G.W. §11).

In the case of the Lorentz transformations, however, simultaneity becomes a three-place relation, the third place being filled by the inertial reference frame relative to which the simultaneity of events is being assessed. Thus, referring to the transformation equations, (2), the locus of events simultaneous with the origin according to the K'-frame, that is, events satisfying the condition $t' = 0$, correspond according to the *K*-frame to the locus $t = vx/c^2$, which is a straight line inclined at a slope v/c^2 to the *X*-axis, which is the locus $t = 0$ of events judged to be simultaneous with the origin by the *K*-frame (for simplicity we ignore the *y* and *z* spatial dimensions for the time being). This has immediate repercussions for reconciling the *A*-theory of time (see Time §1) with the special theory of relativity. For the *A*-theorists the present is a distinguished simultaneity class of events which alone are co-real. The future comprises unrealized possibilities, the past, events that were actual when their occurrence coincided with the then present, but are no longer actual now. According to special relativity theory, if we assume that the relation of co-reality is *not* frame-dependent, then it is easy to prove that all events in spacetime are co-real. This arises simply because if we take any two events *A* and *B* in spacetime there always exists a possible event *C* which is simultaneous with *A* according to one frame of reference *K* and simultaneous with *B* according to another frame of reference K'. If *A* occurs now, then *C* is co-real with *A* according to *K*; so *C* is now real, while *B* is co-real with *C*, according to K'; so *B* is also real now, but since *B* is an arbitrary event it follows that all events in spacetime are real now.

Such an argument has also been used to claim that special relativity is inconsistent with indeterminism, since the occurrence of all events has a determinate truth-value now. The latter argument can be resisted by distinguishing determinateness from determinism (see Determinism and indeterminism). The former argument shows, however, that special relativity is inconsistent with a unique global frame-independent notion of becoming and hence is fundamentally opposed to the underlying intuition of the *A*-theorists, which requires a uniquely distinguished present. The best that can be done in rescuing a notion of becoming is to relativize it to individual time-like worldlines, but the local 'nows' cannot be assembled into a global 'now'.

We turn now to the relativity of temporal duration. Reverting to the transformation equations, (2), it follows immediately that a time interval T' assessed by a clock at rest in the frame K' is assigned an interval *T* by the frame *K*, where *T* and T' are related by

$$T = \frac{1}{\sqrt{1-v^2/c^2}} T' (3)$$

So the moving clock suffers a dilatation of its time-scale in accordance with equation (3).

But it also follows from (2) that clocks stationary in the *K*-frame suffer the *same* dilatation in time-scale as assessed relative to the K'-frame. This reciprocity of clock dilatation I shall refer to as the *clock paradox* of special relativity. How can two clocks each run slow as assessed by each other? It has even been claimed that the clock paradox shows special relativity to be a logically inconsistent theory. But the resolution is simple when

proper account is taken of the relativity of simultaneity. Each clock is not being assessed by the other clock in isolation, but only in conjunction with the relevant standard of simultaneity, which changes according to which reference frame is being used to assess the rate of the clock.

The clock paradox is closely related to another famous paradox in special relativity, the twin paradox. Here one considers two twins (biological clocks), one of which remains at rest in the *K*-frame, the other moves away and then returns to meet up again with the stationary twin. On comparing clock readings (biological ageing), the stay-at-home twin shows a greater lapse of time than the travelling twin. This follows from the time dilatation formula of equation (3). But from the reciprocity of time dilatation would it not follow that, describing the situation from a reference frame in which the traveller is at rest, the original stay-at-home twin would be the younger when they meet up again? Once more a logical contradiction seems to threaten.

The resolution of the twin paradox arises from noting that there is no single *inertial* reference frame relative to which the travelling twin is always at rest. And the reciprocity result only holds between inertial frames. Does this mean that the resolution of the twin paradox requires consideration of accelerated (that is, non-inertial) reference frames for a complete elucidation, as has been widely claimed in the literature? We shall return to this matter in §3.

Just as temporal duration becomes a relative notion in special relativity, the same is also true of spatial lengths. In place of the dilatation formula, (3), it is easy to derive a corresponding contraction formula for length:

$$L = \sqrt{1 - v^2/\mathrm{c}^2}\,L'$$

where L' is the length of a moving rod as assessed by K', and *L* the length assessed by *K*.

But the relativization of simultaneity, temporal duration and spatial length does not mean that *all* spatial-temporal quantities are relativized to reference frames. The central idea in special relativity is that there is a unique velocity, whose magnitude is the *same* as assessed by all inertial referenced frames. In its geometrical interpretation by Minkowski, the invariant notion in the geometry is the interval *s*, and relativity theory should more accurately be called the invariance theory of the interval, that is, the theory of transformations under which the interval is invariant. The attempt to use Einstein's theory to motivate a general thesis of the relativity of local particulars to their global context, as in the philosophy of Alfred Whitehead, is thus seen to be misguided (see Whitehead, A.N. §3).

The question is often asked, do clocks really run slower, or rods really contract, when they move, or do they only *appear* to do so? The answer according to the presentation of the theory we are adopting in this section (but for a quite different answer see §3), is that if the behaviour of the clocks and rods is governed by the laws of *relativistic* mechanics, then it is a consequence of those laws that clocks will run slower, and rods contract, as a result of the detailed mechanics of what happens when they are suitably set in motion. There is thus a harmonious consistency between relativistic kinematics and relativistic mechanics. But at a deeper level we may ask, are the moving rods and clocks *measuring* relativized features of space and time, so is special relativity a theory about space and time *per se*, or is it a theory about how measuring instruments behave when in motion, and not a revision of our concepts of space and time at all? In particular, does the invariance of the speed of light, as measured by different observers in relative motion to each other, arise as a remarkable conspiracy of compensating effects in the instruments which prevent us from ever being able to know our state of absolute motion? The thoroughgoing relativist rejects such conspiracies, and moves directly to new metaphysical theses about the nature of space and time. The compensating theories were espoused by H.A. Lorentz and H. Poincaré and in that sense the real conceptual revolution must be ascribed to Einstein. But was Einstein genuinely a relativist in the sense we have been describing in this section? In the next section a quite different outlook on the theory will be described, the origins of which can also be traced to Einstein's 1905 paper.

3 Causality and the conventionality of simultaneity

Einstein (1915) recognized that the light invariance principle (see §1) could not be directly verified by measurement. With a single clock it would be possible to measure the average two-way speed of light by emitting a light signal at spatial location *A* (marked as event *a* in the figure) reflecting it at location *B* (event *b*) and noting the time of the event a'' when the signal returns to *A*. If *d* is the spatial separation of *A* and *B*, then the average

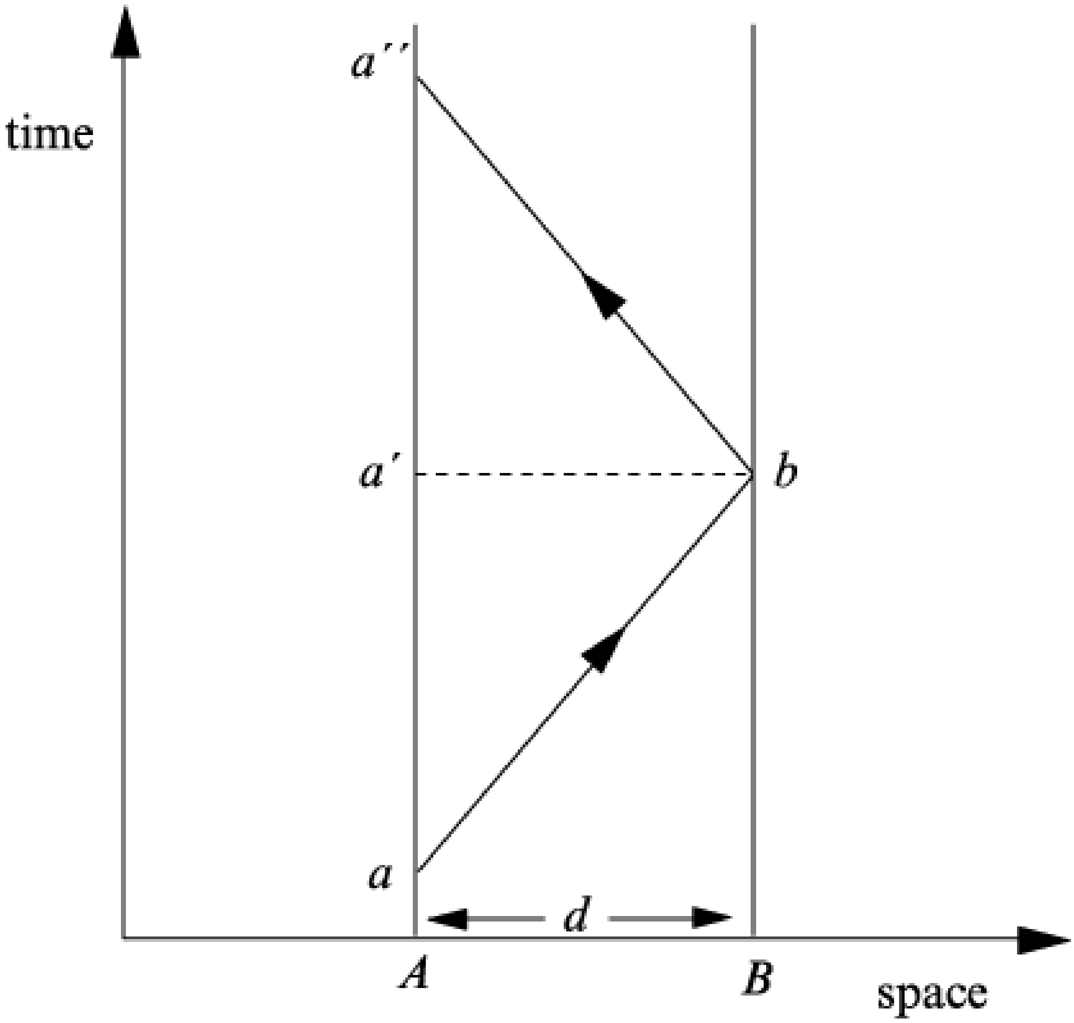
two-way speed of light would be equal to $2d/t_{a''} - t_a$, where the time interval $t_{a''} - t_a$ between the events *a* and a'' is measured by a single clock stationary at *A* throughout the experiment. But how could we measure the one-way speed of light from *A* to *B* or from *B* to *A*? This would require recording the time of event *b* by a clock located at *B*. But this means we would first of all have to synchronize the clocks at *A* and *B*. Einstein assumed that this was done by defining *b* to be simultaneous with the event a', midway in time, according to the clock at *A*, between *a* and a''. This is equivalent to assuming that light propagates with the same speed from *A* to *B* as from *B* to *A*. But Einstein states that this is a matter of *definition*, the one-way speed cannot be measured independently of a decision as to how to synchronize spatially separated clocks.

The line of argument was further developed by Hans Reichenbach (1928) who claimed that one could set

$$t_b = t_a + \varepsilon(t_{a''} - t_a)(5)$$

where the parameter εhas any value between 0 and 1, the choice being a matter of convention, the Einstein convention corresponding to the choice $\varepsilon = 1/2$. What Reichenbach is claiming then is that *b* can be identified as simultaneous with any event in the closed interval [*a*, a'']. The conventionality thesis is based, not just on the invariance of the light speed, but on the limiting velocity principle, that light is the fastest possible signal, thus preventing us from using a faster signal to narrow down the conventional latitude [*a*, a''] of events at *A* ascribed simultaneity with the event *b* at *B*.

Adolf Grünbaum expressed the matter somewhat differently by defining a concept of topological simultaneity which relates any two events not connectable by a causal signal. Thus any two events at space-like separation are topologically simultaneous. Grünbaum claimed that any more precise identification of distant simultaneity could have no ontological status, since it could not be specified in purely causal terms.



Measuring the speed of light by sending a signal from A to B and back again

It is easy to show that any two events which are topologically simultaneous can be made metrically simultaneous relative to the Einstein convention applied in a suitably moving inertial reference frame. In other words the range of events, such as [a, a''] in the figure which are topologically simultaneous with the distant event (such as b in the figure) in a *given* frame of reference is exactly the same as the range of events that are declared metrically simultaneous with the distant event in *different* frames of reference, according to the relativity of simultaneity (which, of course, follows from the Einstein convention).

By exploiting the conventionality of simultaneity in a given frame, we can actually eliminate the relativity of simultaneity, temporal duration and length as between different frames! So, from this point of view, these effects are not ‘real’, as opposed to effects such as the invariance of the average two-way speed of light which do not depend on any simultaneity convention.

The conventionality thesis has attracted considerable discussion in the literature. First it has been argued that Einstein synchrony *is* causally definable. To explain this, we can note that Einstein synchrony in a given reference frame is equivalent to the locus of events which are orthogonal in Minkowski geometry to the world-line of the origin of the reference frame. There has been a series of results in the literature showing that Minkowski-orthogonality is causally definable. So given the world-line of the origin of a reference frame, then Einstein synchrony in that frame can be defined causally. But the conventionalist response is just to note that relative to a given frame we are free to use the causally defined Einstein synchrony relative to a moving frame, but

as we have seen this is the same as using nonstandard synchrony in the given frame. The same argument can be used to resist the admitted fact that, in the limit of a sufficiently slow transport of a clock, such transport can be used to pick out Einstein synchrony. But again the conventionalist retorts that in a given frame we can use clock transport which is sufficiently slow relative to a moving frame to establish Einstein synchrony relative to that frame, and hence nonstandard synchrony relative to the original frame.

It is a remarkable fact that in four-dimensional Minkowski spacetime the causal structure determines the complete metric structure (*modulo* dilatations). From a point of view which emphasizes the geometrical structure of spacetime the issue of how we coordinatize the spacetime can appear trivial, but from the causal point of view the conventional latitude in simultaneity in a given frame can be regarded as licensing the discordant ascriptions of simultaneity relative to moving frames in the orthodox interpretation.

The limiting velocity principle is a logically stronger principle than the light invariance principle. Indeed the latter is consistent with the possibility of tachyons, particles which *always* travel faster than light. However it has been argued by Redhead that there are inherent limitations in the use of tachyons as a signalling device that arise out of their relativistic properties, and that a suitable emendation of Grünbaum's causal criterion for simultaneity can still yield his same notion of topological simultaneity even in the presence of tachyons.

Finally we may note that the conventionality approach can be usefully applied to the twin paradox, avoiding the use of accelerated reference frames (Redhead 1993).

4 General covariance

We turn now to the development of the general theory of relativity (GR). Historically Einstein believed this to be an extension of the relativity principle from inertial frames to arbitrary reference frames. However subsequent analysis has shown that GR is a quite different sort of theory from special relativity (SR) as we shall now attempt to explain. GR considers spacetime as a semi-Riemannian manifold. By a manifold one means that spacetime can be coordinatized by quadruples of real numbers and this can be carried out in many different ways, different possible coordinates being related by smooth mathematical transformations. This generality of description replaces the coordinates supplied by inertial reference frames and their relationship via the linear transformations of the Lorentz group. Just as in Minkowski spacetime there is defined an invariant interval between events specified by a metric with a Lorentzian signature, so in GR we assume spacetime to be equipped with a variable metric, but still with the property that by a suitable smooth transformation the metric can be reduced to the Lorentzian form at a given spacetime point, but in general this cannot be achieved over a region of spacetime, only at a single point. As first shown by Bernhard Riemann this corresponds to the fact that the manifold is curved as opposed to flat over that region (see Space §4; Spacetime §3). Moreover local inertial reference frames can be introduced relative to which gravitational effects can be (locally) eliminated, and Einstein assumed a generalized equivalence principle according to which *all* physical phenomena reduced to their SR description relative to such frames.

Einstein's field equations can be written symbolically in the form

$$G = \kappa T (6)$$

where *G* is a quantity related to the curvature of spacetime and *T* represents the distribution of matter and electromagnetic energy throughout spacetime; κis a fundamental constant representing the coupling of the geometry to the distribution of mass/energy.

The fact that the field equations can be written in so-called component form using *any* system of coordinates in spacetime was called by Einstein the principle of general covariance. But the fact that we can redescribe spacetime points in many different ways does not of itself have any physical content, as was pointed out by E. Kretschmann in 1917. In no sense is the principle of general covariance a generalization of the principle of Lorentz invariance that arises in SR.

Important clarification of this issue was introduced by J. Anderson in 1967, who expressed covariance and invariance principles in terms of active point transformations on the spacetime manifold *M* instead of the passive coordinate transformations. Smooth point transformations are known to mathematicians as diffeomorphisms. Coordinate transformations induce diffeomorphisms according to the rule that corresponding points have the *same* numerical coordinates in the two coordinate systems. A geometric object field 0 is transformed to a new object

field, the ‘drag-along’ of 0, written d_*0, under the diffeomorphism *d*, where d_*0 evaluated at the transformed point $d(p)$ has the same numerical components with respect to the new coordinate system as does 0 evaluated at *p*, with respect to the old coordinate system.

Anderson partitions the geometric objects into absolute objects A_i which characterize the fixed geometrical spacetime background and dynamical objects P_j which characterize the physical contents of spacetime. The active version of general covariance then states that if $\langle M, A_i, P_j \rangle$ is a model of a spacetime theory *T*, then so also is $\langle M, d_*A_i, d_*P_j \rangle$. The diffeomorphisms are said to comprise the covariance group of *T*. A spacetime symmetry is a diffeomorphism for which $d_*A_i = A_i$, for all values of *i*. SR then is a spacetime theory in which the Minkowski metric is the absolute object, and the spacetime symmetries are the Lorentz transformations that maintain the invariance of the metric. But in GR there are no absolute objects: the geometrical structure characterized by the metric is itself a dynamical object. In a degenerate sense all diffeomorphisms become spacetime symmetries, so the spacetime symmetry group and the covariance group are formally identical, but the symmetry no longer has physical content just because it provides no *restriction* on the covariance group.

Anderson failed to provide a precise mathematical definition of absolute object, although the intuitive meaning seems clear enough. This technical problem has still not been given a satisfactory solution, despite a notable attempt by Friedman (1983) to clarify Anderson’s ideas.

General covariance is not the distinctive feature of GR. Indeed Newtonian gravitational theory can also be expressed in generally covariant form. The distinctive feature of GR is the dynamic interplay between the geometrical structure of the spacetime and the distribution of mass and energy in the spacetime, and the fact that the geometric structures (curvature, affine connection, and so on) are all specifiable in terms of a metric.

Solutions of the Einstein field equations tell us how the geometric structure (the metric and associated curvature) vary throughout spacetime. Einstein originally augmented the field equations with a principle stating that an uncharged test-particle introduced into the spacetime would follow a geodesic path defined by the metric field. So, in a crisp slogan, a test-particle according to Einstein moves in a straight line in a curved spacetime, whereas in Newtonian gravitational theory it would move in a curved line, in a flat spacetime. In GR the metric does ‘double duty’, defining both the local spacetime geometry, and also specifying the effective gravitational field acting on a test-particle. It was later shown that the geodesic equation of motion is not an independent principle, but actually is a consequence of the field equations themselves.

5 Determinism and substantivalism in general relativity

We shall now examine a number of arguments concerned with the question of whether GR is consistent with a substantival interpretation of spacetime or with a relationist interpretation (see Space §3).

We begin with an ingenious argument that if we assume determinism then GR is inconsistent with a substantivalist conception of spacetime points. Suppose $\langle M, g, T \rangle$ is a model of GR with metric *g* and mass/energy distribution *T*. *M* is the spacetime manifold whose points are treated by the substantivalist as ‘individuals’ to which properties, the values of the *g*- and *T*-fields, can be attributed. Then, according to general covariance, for an arbitrary diffeomorphism *d*, $\langle M, d_*g, d_*T \rangle$ is also a model. Now consider an arbitrary proper neighbourhood in spacetime, which we refer to as a ‘‘hole’, and take for *d* a diffeomorphism such that it is the identity map everywhere outside the hole, but unequal to the identity inside the hole. The original model and the new model produced by dragging inside the hole with such a so-called hole diffeomorphism are distinct spacetimes, in the sense that inside the hole the same manifold points are associated with different values of the metric field and mass/energy field. But the two models agree everywhere outside the hole, so what has been shown is that there can be no unique physics *inside* the hole that is controlled by the state of affairs *outside* the hole, so determinism in the weakest possible sense is violated.

Notice that the argument fails in SR, where the symmetry group is sufficiently restrictive that hole diffeomorphisms, which are also symmetries of the Minkowski metric, cannot be constructed.

In standard modern text books of GR, spacetimes are specified only up to diffeomorphism on the grounds that diffeomorphically related spacetimes are empirically equivalent. This of course is true, but does not help the thoroughgoing substantivalist, who does not believe that empirical equivalence implies ontological equivalence.

The worrying point is that the failure of determinism demonstrated is a pervasive feature of GR spacetimes, and does not depend on the detailed physics of field equations, equations of motion, and so on.

There has been much discussion of the ‘hole’ argument in the philosophical literature. Possible responses include just accepting the failure of determinism as a metaphysical discovery about GR spacetimes, or giving up a version of substantivalism in which the identity of spacetime points is independent of properties instantiated at those points, and allowing the identity of spacetime points to follow the dragged metric field (metrical essentialism). Another approach is to resort to counterpart theory and refuse to allow that the dragged model refers to the *same* points of spacetime as the original model, but just to counterparts of those points, the counterparthood relation being formulated so as to rescue a definition of determinism that does not fall foul of the hole argument.

No completely satisfactory solution of the problem has been proposed by the substantivalists, but as we shall argue in the next section, this does not mean that GR should be interpreted relationally; that is, that spacetime just expresses relational properties of the contents of spacetime as encoded in the *T*-field.

6 Mach’s principle

In GR we can raise the question: what determines the local inertial reference frames relative to which the laws of SR hold, according to the generalized equivalence principle? The local inertial frames are themselves determined by the *g*-field, so we can rephrase the question as: what determines the *g*-field? Looking at Einstein’s field equations the possible answer suggests itself that it is the *T*-field, that is, that matter (or other forms of energy) is the source of the *g*-field. This would suggest that mass/energy is the ultimate origin of inertia, rather than spacetime itself. If correct this would demonstrate the implementation in GR of the principle enunciated by Ernest Mach in his critique of classical mechanics at the end of the nineteenth century (1893), that inertial effects in a terrestrial laboratory arise from motion relative to the average matter in the whole universe. If the matter were removed, inertia would disappear, since there would be no chimerical absolute Newtonian space surviving the removal of the contents of the space. Einstein certainly anticipated that GR would support a relationist conception of spacetime, and that Mach’s principle would be a crucial feature of his theory. This turned out not to be the case, for a number of reasons we shall now try to explain.

First we should note that in the field equations the specification of the density of the *T*-field on the right-hand side of the equation already involves the *g*-field, so that the *T*-field cannot be regarded as an independent input to the equations, independent, that is, of the spacetime geometry. Second, the solutions of the field equations involve in general boundary conditions, which again have to be specified in terms of the behaviour of the *g*-field (Einstein tried to obviate this difficulty by requiring the universe to be spatially closed, thus eliminating the need to specify boundary conditions at spatial infinity). Third, it is possible to define the rotation of the matter field with respect to the local inertial frames specified by the *g*-field. So it makes sense in GR to talk of matter rotating locally relative to spacetime, rather than with respect to the rest of the material contents of spacetime. A nice example is the rotating universe discovered by Kurt Gödel (see Spacetime §4). Fourth, we can ask what happens if we set $T = 0$ throughout spacetime. In the spirit of Mach’s principle, the vacuum equations $G = 0$ should admit of no solutions. However, many non-flat matter-free solutions of the field equations exist, in which, informally speaking, gravitational energy provides the source of the curvature (note that in the Einstein field equations gravitational energy is *not* included in the *T*-field).

So one concludes that GR is quite inimical to a relationist conception of spacetime. Far from reducing spacetime to matter, one may indeed envisage spacetime as the primary ontological category, and regard matter (and electromagnetism) as reducible to certain geometrical features of the spacetime.

7 Supersubstantivalism

Supersubstantivalism is the view that spacetime is not just *a* substance but the only substance. What we regard as matter is just a region endowed with certain sorts of geometrical structure, and other candidates for physical reality, such as electromagnetic fields, are also to be given a geometrical interpretation. Precursors of this view include Isaac Newton, who interpreted matter in terms of a property of impenetrability impressed on a region of space, and Rudjer Boscovich and Michael Faraday who regarded material atoms as centres of active force, rather than substantial bodies. William Kingdon Clifford applied Riemann’s theory of curved manifolds to suggest a

geometrical interpretation of matter in terms of local regions of curvature impressed on physical space. Einstein in his own later work sought geometrical explanation of electromagnetic forces in terms of additional geometric structure such as asymmetric connections or higher dimensions of the spacetime manifold. But in terms of orthodox GR, a theory known as geometrodynamics was especially espoused by John Wheeler (1962) and his associates. This exploited an identification of the electromagnetic field with aspects of the four-dimensional geometry, due originally to G. Rainich, electric charges being associated with novel small-scale topology in the spacetime structure, while mass was identified with local concentrations of curvature in the style of Clifford (1876). Technically geometrodynamics foundered in the 1960s due to the pervasive existence of singularities in the solutions of the GR field equations, and problems associated with formulating the initial value problem for the time-evolution of the metric. Nevertheless the spirit of supersubstantivalism has continued to exercise a strong hold on further developments in theoretical physics associated with the programme of quantizing gravitation and unifying it with the other fundamental interactions of electromagnetism and nuclear physics in the general framework of a geometrically interpreted quantum field theory.

Relevance logic and entailment

'Relevance logic' came into being in the late 1950s, inspired by Wilhelm Ackermann, who rejected certain formulas of the form $A \rightarrow B$ *on the grounds that 'the truth of A has nothing to do with the question whether there is a logical connection between B and A'.*

The central idea of relevance logic is to give an account of logical consequence, or entailment, for which a connection of relevance between premises and conclusion is a necessary condition. In both classical and intuitionistic logic, this condition is missing, as is highlighted by the validity in those logics of the 'spread law', $A \;\&\; {\sim}A \rightarrow B$*; a contradiction 'spreads' to every proposition, and simple inconsistency is equivalent to absolute inconsistency. In relevance logic the spread law fails, and the simple inconsistency of a theory (that a set of formulas entails a contradiction) is distinguished from absolute inconsistency (or triviality: that a set of formulas entails every proposition). The programme of relevance logic is to characterize a logic, or a range of logics, satisfying the relevance condition, and to study theories based on such logics, such as relevant arithmetic and relevant set theory.*

1 The calculus of entailment

'Relevance logic' (also known as 'relevant logic') was born in the late 1950s, when Alan Ross Anderson and Nuel D. Belnap were inspired by reading a paper by Wilhelm Ackermann (1956). In that paper, 'Begründung einer strengen Implikation' (A Foundation for a Rigorous Implication), Ackermann set out to characterize an implication relation, or connective, $A \rightarrow B$ in which there was always a connection between *A* and *B*. 'Rigorous implication', he wrote, 'is intended to express the idea that a logical connection holds between *A* and *B*, that the content of *B* is part of the content of *A*' (1956: 113). Formulas which, though valid in classical logic, were rejected by Ackermann on the grounds that 'the truth of *A* has nothing to do with the question whether there is a logical connection between *B* and *A*' included

$A \rightarrow (B \rightarrow A)$ $\qquad A \rightarrow (B \rightarrow A \;\&\; B)$

$A \rightarrow ({\sim}A \rightarrow B)$ $\qquad A \rightarrow ((A \rightarrow B) \rightarrow B)$

$B \rightarrow (A \rightarrow A)$ $\qquad A \rightarrow (A \rightarrow A)$

$A \;\&\; {\sim}A \rightarrow B.$

Ackermann began his paper by recalling C.I. Lewis' reasons for developing his calculus of strict implication as a calculus expressing a more reasonable notion of 'implication' or 'entailment' than was current at the time (see Lewis 1914). (That the quest for a relevant notion of entailment goes back well before Lewis has been demonstrated more recently by C.J. Martin (1986) in his investigations into twelfth-century logic.) But Ackermann believed Lewis had not gone far enough. Although the first four formulas above fail when '$\rightarrow$' is interpreted as strict implication, the last three still hold. Moreover, taking '$\Box$' to represent 'is necessary', $\Box A \rightarrow (B \rightarrow A)$ and $\Box{\sim}A \rightarrow (A \rightarrow B)$ were theses of Lewis' system of strict implication. Ackermann added '$\Box$' to his calculus of rigorous implication (via an absurdity constant '$\bot$' and a definition of '*A* is impossible' as $A \rightarrow \bot$) and showed that the above so-called 'paradoxes of strict implication' fail when '$\rightarrow$' is taken as rigorous implication.

Belnap reports returning to Yale University from a year in Europe working with Feys on composing a Gentzen system for Ackermann's system, to write up his Ph.D. dissertation, and ingenuously asking Anderson if he knew anyone in the United States who was interested in Ackermann's work. Anderson, feeling equally isolated in his fascination with Ackermann's ideas, having reviewed them in the *Journal of Symbolic Logic*, was delighted to find, as Belnap put it, a 'fellow Strengenite'. Together they started the research programme which led to more than thirty years' creative work on every aspect of a logic of relevance.

How does their work relate to Ackermann's? The initial motivation was the same, and the same goal which had inspired Lewis: to find a satisfactory explication of the concept of entailment, or (formal) logical consequence. Therefore, in the first decade of work, the focus was on the calculus of entailment (E) incorporating aspects of both relevance and necessity. E validates the same theses as Ackermann's system, and differs from it in several apparently minor ways, which in fact are quite significant. First, '$\Box A$' can be defined directly in the basic system

as $(A \to A) \to A$, yielding the same theses, so '$\bot$' and the associated apparatus can be removed. '$\to$' is itself a modal connective (the '$\to$'-fragment of E is a subsystem of the arrow fragment of S4). Second, two of Ackermann's four rules of inference, namely (γ) and (δ), though unproblematic in the pure logic, are unacceptable when the logic is extended to a substantive theory. Anderson and Belnap showed that they could be dispensed with. Ackermann's rule of inference (γ) says that a proof of *B* results immediately from proofs of $A \vee B$ and $\sim A$. The point is this: whenever $A \vee B$ and $\sim A$ are provable in the pure logic of E, so too is *B*, that is, (γ) is an admissible rule of E, and so is redundant. (Conjectured in 1958, the first proof was not found until ten years later.) But in a theory based on E, there might be proofs of $A \vee B$ and $\sim A$ (that is, these formulas might belong to the theory, extending E by non-logical axioms) without there necessarily being a proof of *B* (or of $\sim B$ - the theory need not be negation-complete). One major task in the research programme of relevance logic became to show the admissibility of (γ) for various E-theories, once E was shown to admit (γ) itself. We will note later the major disappointment in this search, the failure of (γ) for relevant arithmetic.

The problem with the rule (δ) is similar, but less deep and seminal. (δ) says that from $A \to (B \to C)$ and a proof of *B* one can infer $A \to C$. Again, the proof of *B* must be logical. Even if $A \to (B \to C)$ and *B* belong to a theory, $A \to C$ might not. Indeed, what (δ) seems to promise is a permutation, from $A \to (B \to C)$ to $B \to (A \to C)$, and that is unacceptable in the modal logic E, being a fallacy of modality. (Let *A* be $B \to C$ itself, and consider how the permutation would fail in S4 with '$\to$' as strict implication.) Such a move is legitimate only if *B* is appropriately modal, which we can capture with the connective '$\Box$'. (δ) can therefore be replaced by an axiom,

$$(A \to (B \to C)) \to (\Box B \to (A \to C)),$$

or, equivalently, as Anderson and Belnap chose to do in E,

$$(\Box A \mathbin{\&} \Box B) \to \Box(A \mathbin{\&} B),$$

with '$\Box$' defined as above.

E, the calculus of entailment, had thus been born; its study was to reveal new worlds in logic, and, before long, to shift attention to a range of related logics. (See Anderson and Belnap 1975, 1992.)

2 The calculus of relevant implication

Anderson and Belnap called E the logic of relevance and necessity. However, it is important to understand that the programme they embarked on did not try to give any general characterization of relevance, or even of relevance as a logical notion. What they identified were what they called fallacies of modality and of relevance. Fallacies of modality were first characterized by them for the '$\to$'-fragment as taking as valid any formula of the form $B \to (A \to C)$, where *B* was a propositional variable. Ackermann had suggested the criterion for his full calculus that neither '$\to$' nor '$\bot$' should belong to *B*.

Arguably, neither characterization really identifies what a modal fallacy is. For one thing, neither condition easily generalizes beyond the propositional language given. Adding further connectives or quantifiers and the language of predicates, one must generalize the condition, yet that means one needs some understanding of what motivates it. Pottinger tried to capture a notion suitable for E (see Anderson and Belnap 1975: 348), but again, how it would generalize further is unclear. These are technical criteria, not proper philosophical analyses. Moreover, while separating the modal from the relevance fallacies is a promising idea, a natural consequence is that the modal fallacies should equally be rejected in S4. Yet $B \to (A \to C)$ is a thesis of S4 whenever $A \to C$ is, regardless of the nature of *B*, even if it is a propositional variable. The answer is that a modal fallacy is essentially a permutation move, promoting *B* from its secondary position to a primary one: from $A \to (B \to C)$ to $B \to (A \to C)$. Such a permutation will permit, *inter alia*, validation of formulas $B \to (A \to C)$ where *B* is a propositional variable (or contains neither '$\to$' nor '$\bot$'). Checking that such formulas are not theses is a useful test that a system does not commit any modal fallacies. But it is not an adequate explication of the notion.

Fallacies of relevance were also characterized by Anderson and Belnap only in technical terms, without any wider elaboration of what was really wrong with them. Their formal tests of relevance were variable-sharing and derivational utility. The former again only applies to the propositional fragment. The idea was that $A \to B$ is valid only if *A* and *B* share a propositional variable. Belnap presented matrices which test for this condition. The

other criterion arose from an attempt by Anderson and Belnap to prove a deduction theorem for Ackermann's system, and led to the creation of a (Fitch-style) natural deduction formulation of E. They developed sets of indices which kept track of relevance through the proof. Conditional proof (the analogue in the natural deduction formulation of the deduction theorem as a result about axiomatic formulations) was permissible only when in the proof of *B* from *A*, *B*'s index contained that assigned to the assumption of *A*. The idea has been fecund in the development of relevance logic, especially when one realizes that the indices play the role of the assumption lists in a Gentzen-style formulation of the logic as a natural deduction calculus of sequents. But it is still a restricted and technical idea: how will it generalize when we extend the calculus to, say, second-order, and outstrip proof theory? In brief, what is really meant here by relevance?

But separating ideas of relevance from those of modality permitted the creation of the system R of relevant implication. This results from E by relaxing the restriction on permutation. The '$\rightarrow$' of R is a non-modal relevant conditional. It was seen as relating to the '$\rightarrow$' of E as material implication relates to strict implication. Yet in this development lay the effective death-knell of E. If one now starts with R and adds an S4-necessity operator '$\Box$', there are theses containing '$\Box$' only in the position $\Box(A \rightarrow B)$ which do not result from theses of E in which $A \rightarrow B$ has been replaced by $\Box(A \rightarrow B)$. Since this discovery in 1973 (see Anderson and Belnap 1975: 351-2), work on R and its extensions and subsystems has put E in the shade.

3 The systems of relevance logic

With the creation of R, and more so with its eclipse of E, the stage was set for a study of a full range of systems of relevance logic. Immediate neighbours of E and R were the system T of 'ticket entailment' and the 'mingle' systems EM and RM. Ticket entailment picked up an idea of Ryle's; that conditionals are a kind of inference-ticket, licensing the inference from one factual (non-conditional) statement to another. T is a subsystem of E which effectively restricts even the permutation of conditional antecedents which is allowed in E.

The mingle systems extend E and R by the addition of the axiom $A \rightarrow (A \rightarrow A)$. This looks harmless, lacking the obvious irrelevance of $A \rightarrow (B \rightarrow A)$. But adding the mingle axiom to R leads to the validity of $(A \rightarrow B) \vee (B \rightarrow A)$, and we find one of the classic paradoxes of material implication has returned. RM is an interesting source of study; but it is, in Meyer's phrase, a 'semi-relevant logic'.

With hindsight, one can see the study of E and R as the start of research into a range of systems which in the early 1990s came to be called 'substructural logics'. Two insights led to this development. One was recognition of the Curry-Howard correspondence, the treatment of formulas as types (see Lambda calculus). This reveals that the '$\rightarrow$'-fragment of R was being studied even in the 1930s by Church, in his λ-I calculus. In the λ-calculus one studies functions, developing a framework for the general treatment of functional abstraction and application. The reductions and equivalences of functional expressions are governed by combinators, so that, for example, the combinator *B* asserts that the composition of functions is associative: $B(fg)h$ reduces to $f(gh)$ (see Combinatory logic §1). Correlating functional abstraction with conditional proof, functional application with *modus ponens*, there is a natural correlation of the definability of λ-terms, or combinators, with the provability of '$\rightarrow$'-formulas (which extends to Cartesian product and conjunctions, and so on). R (or at least, its '$\rightarrow$'-fragment) is then seen as BCW-logic, the logic of associativity, permutation and contraction, placed in a family with BCK-, BCI- and other logics. BCI-logic, otherwise known as the '$\rightarrow$'-fragment of RW (R without contraction) corresponds to Church's λ-I calculus. The relevance logics can then be classed as those representing functions that 'really depend on their arguments', rejecting the combinators such as *K*, corresponding to the λ-term $\lambda x, y.x$ (see Combinatory logic §1).

The other development was 'correspondence theory', the study of the correlation between logical principles and constraints on corresponding relations in the model theory. It started in the study of semantics for modal logics, whereby different conditions on accessibility in possible worlds semantics are seen to match various axioms for necessity, '$\Box$', in the logic modelled. The semantics for relevance logic began to be worked out in the late 1960s and early 1970s by Dunn, the Routleys, Meyer, Maximova and Fine, working largely independently. There were two aspects needing special attention. First, a way of invalidating the spread law had to be found, and that seemed to require modelling *A* and $\sim A$ simultaneously. One solution was the negation-shift operation, pairing each world *w* with w^*, whereby $\sim A$ is true at *w* if and only if *A* is true at w^*. Suitable constraints on '*' give the right involute properties to '$\sim$'. The other aspect was the relevance '$\rightarrow$' itself, whether for E or R (or related logics).

The approach which has come to dominate uses a three-place relation on worlds, *R*, whereby $A \rightarrow B$ is true at *x* if *B* is true at *b* whenever *A* is true at *a* and *Rxab*. Again, suitable constraints on *R* give the desired properties of ‘ $\rightarrow$’. Fine’s version used a pre-ordering of worlds (as in S4) and an operation of fusion, ‘ $\circ$’, such that $A \rightarrow B$ is true at *x* if *B* is true at $x \circ a$ whenever *A* is true at *a*. This operational semantics makes more transparent the correspondence with the combinators. The correspondences thus set up identify a range of logics, the substructural logics (logics with restricted structural rules), which differ essentially only in their structural rules.

This assumes, however, the invariance of the Boolean apparatus of ‘Čamp;’ and ‘ $\vee$’ erected on the underlying calculus of ‘ $\sim$’, ‘ $\rightarrow$’, and perhaps fusion ‘ $\circ$’, with $A \circ B$ true at $a \circ b$ whenever *A* is true at *a* and *B* at *b*. ‘ $\circ$’ is a ‘relevant conjunction’, $A \circ B \rightarrow C$ being equivalent to $A \rightarrow (B \rightarrow C)$. ‘Čamp;’ and ‘ $\vee$’ need not be so invariant, however. Ackermann noted that distribution of ‘Čamp;’ over ‘ $\vee$’ no longer followed from the other axioms when restricted to yield rigorous implication, and so added it as a separate axiom. Anderson and Belnap followed him, supporting the case by yet another criterion of relevance, applied to first-degree entailments ($A \rightarrow B$ where *A* and *B* contain only ‘ $\sim$’, ‘Čamp;’ and ‘ $\vee$’); that they be tautological: putting *A* in disjunctive normal form (DNF) and *B* in conjunctive (CNF), every disjunct on the left shares an atom with every conjunct on the right, roughly, *B* is ‘contained in’ *A*. But some have argued that dropping the combinator *K* (‘weakening’) as the source of irrelevance in full classical logic, should yield a non-distributive calculus. Interestingly, every classical tautology (in ‘ $\sim$’, ‘Čamp;’ and ‘ $\vee$’) is provable in R. But this fact fails for the non-distributive calculus. For example, the axiom ‘sum’ of *Principia Mathematica*,

$$(Q \supset R) \supset ((P \vee Q) \supset (P \vee R)),$$

with ‘ $A \supset B$’ for ‘ $\sim A \vee B$’, is unprovable in LR (R without distribution). LR was the focus of much research in automated theorem proving in the 1980s.

Dropping *W* (‘contraction’) from LR yields a fragment of Girard’s linear logic (1987), as does dropping distribution from RW (see Linear logic). Girard’s rich theory, encompassing additive connectives (‘Čamp;’ and ‘ $\vee$’ - there written ‘Čamp;’ and ‘ $\oplus$’), multiplicatives (‘ $\rightarrow$’ and ‘ $\circ$’ - there ‘ $\multimap$’ and ‘ $\otimes$’) and exponentials (the modal operators ‘!’ and ‘?’), tracking the essential and profligate use of resources, picks up Church’s original interest in BCI and has played a central role recently in theoretical computer science.

Those relevance logics (Ackermann’s system is one exception) which reject the spread law in the form $A \mathbin{\&} {\sim}A \vdash B$, are paraconsistent logics (see Paraconsistent logic). For some, they even share a motivation, namely, to allow logical treatment of inconsistent theories without making them trivial (their deductive closure does not embrace everything, as in classical logic). But for others, their motivation is different: many paraconsistent logics arise from an interest in dialetheism, the belief that some inconsistent theories are true. Wider still run the ‘sociative logics’ (a term of Sylvan’s), encompassing relevance, connexive, non-transitive and a whole range of, as he puts it, ‘broadly relevant’ logics.

4 Relevant predication and arithmetic

This survey of relevance logics suggests an undue concentration on the zero-order (propositional) fragment, and that reflects the facts. But important results have been established for first-order relevance logic, relevant arithmetic and so on. For too long, perhaps, it was thought that the extension to first-order was straightforward. Fine’s discovery that plausible ways of extending the proof theory and semantics to first-order quantifiers led to incompleteness was a surprise, not really softened by his later elaboration of a semantics which did not validate the unprovable formulas (see Anderson and Belnap 1992: §§52-3). Urquhart’s demonstration of undecidability for propositional T, E and R settled an open problem of twenty years’ standing, again in a surprising way (1992: §65). (The non-distributive logics are decidable.) The failure of (γ) for the formulation $\mathrm{R}^{\#}$ of relevant arithmetic was another surprise, blocking a natural line of research.

The exposure of these negative results in the 1980s was not unlike the exposure of the limitative results for classical mathematics (incommensurability, uncountability, incompleteness). At first, relevance logic lost momentum as they were settled, and settled in such surprising and negative ways. Nonetheless, limitative results notoriously give rise, once assimilated, to new avenues of research. They are appearing in relevance logic, two notable ones being the attempt to characterize a notion of relevant predication by Dunn and others (Anderson and Belnap 1992: §74) - recognizing that the extension to first-order is not straightforward; and the search for a

relevant arithmetic which admits (γ) (1992: §72) - perhaps by strengthening the rule of induction.

Reliabilism

Reliabilism is an approach to the nature of knowledge and of justified belief. Reliabilism about justification, in its simplest form, says that a belief is justified if and only if it is produced by a reliable psychological process, meaning a process that produces a high proportion of true beliefs. A justified belief may itself be false, but its mode of acquisition (or the way it is subsequently sustained) must be of a kind that typically yields truths. Since random guessing, for example, does not systematically yield truths, beliefs acquired by guesswork are not justified. By contrast, identifying middle-sized physical objects by visual observation is presumably pretty reliable, so beliefs produced in this manner are justified. Reliabilism does not require that the possessor of a justified belief should know that it was reliably produced. Knowledge of reliability is necessary for knowing *that a belief is justified, but the belief can* be *justified without the agent knowing that it is.*

A similar reliabilist account is offered for knowledge, except that two further conditions are added. First, the target belief must be true and, second, its mode of acquisition must rule out all serious or 'relevant' alternatives in which the belief would be false. Even an accurate visual identification of Judy does not constitute knowledge unless it is acute enough to exclude the possibility that it is her twin sister Trudy instead.

One major virtue of reliabilism is its ability to secure knowledge against threats of scepticism. In place of excessive requirements often proposed by sceptics, reliabilism substitutes more moderate conditions. People do not need infallible or certainty-producing processes to have justified beliefs, according to reliabilism, only fairly reliable ones. Processes need not exclude radical alternatives like Descartes' evil demon in order to generate knowledge; they need only exclude realistic possibilities like the presence of an identical twin.

1 Reliabilism and naturalistic epistemology

Reliabilism is often regarded as a species of naturalistic epistemology (see Naturalized epistemology). There are various properties of an epistemology that might invite the label 'naturalistic', and reliabilism has most if not all of them. First, an epistemological theory may be called naturalistic if it holds that normative epistemic properties are reducible to natural, non-epistemic properties and relations. The reliabilist theory of justified belief sketched above fits this description. It tries to reduce the normative property of 'justifiedness' to three types of 'natural' properties: psychological properties (for example, being a psychological process), causal relations and truth. It is generally agreed that psychological properties are non-normative (certainly not epistemically normative, at any rate), and similarly for causation. Although some philosophers maintain that truth is an epistemic concept, which should be defined in terms of justification or rationality, reliabilism typically rejects epistemic analyses of truth in favour of a realist, non-epistemic account, such as a correspondence theory (see Truth, correspondence theory of). If the latter approach is correct, then only natural properties are invoked by reliabilism.

Reliabilism is also naturalistic in portraying the cognitive agent as a natural - that is, physical or biological - system and interpreting epistemic accomplishments as the products of natural processes or mechanisms. Psychological operations, processes or mechanisms may be conceptualized as input-output devices, where the inputs are doxastic or nondoxastic states and the outputs are beliefs. One variant of reliabilism, the information-theoretic approach, views the cognitive system as an 'information-processing' system. Knowledge that *s* is *F* is acquired when the system receives the 'information' that *s* is *F*, that is, when it receives a signal that eliminates all (relevant) counter-possibilities. Since the concept of information transmission has been applied to a variety of physical systems, this approach has a strong naturalistic flavour (see Information theory and epistemology).

Epistemologies are called naturalistic in a third sense when they appeal to empirical science for the execution of certain epistemological tasks. Under one brand of reliabilism, for example, it is a task for cognitive science to identify the specific psychological operations available to human cognizers and to determine their reliability. Of course, ordinary people must have rough and intuitive notions of our psychological processes; otherwise they could not segregate beliefs into the categories of justified and unjustified. But cognitive science may be expected to produce more revealing and refined accounts of belief-forming processes.

At what age, for example, are children able to form reliable beliefs about the number of objects in a collection, and

what mental operations enable them to do so? Surprisingly, it appears that infants as young as five months are sensitive to numbers and can calculate the results of small additions and subtractions. Judging by the amount of time infants stare at a display, psychologists have determined that they expect one item added to one item to yield two items, and expect the subtraction of one item from two items to leave one item. The plausibility of early - indeed, innate - counting abilities in humans is strengthened by the discovery of impressive feats of counting in non-human animals. Rats, for example, can identify the number of times they have pressed a lever, up to at least twenty-four presses, when they are trained to press a specified number of times on a particular lever before pressing once on a second lever for a reward (see Innate knowledge).

What operation or mechanism might subserve reliable counting? One possibility proposed by researchers is an accumulator device. A hypothesized pacemaker puts out pulses at a constant rate, which can be passed into an accumulator by the closing of a mode switch. Every time an entity is experienced that is to be counted, the mode switch closes for a fixed interval, passing energy into the accumulator. The accumulator fills up in equal increments, one for each entity counted. A device of this sort would be a reliable counter. If animals have some such mechanism, their numerical beliefs generated by it would qualify as knowledge according to reliabilism.

Reliabilism does not claim, of course, that knowledge depends exclusively on specialized innate mechanisms. Culturally acquired methods, such as a method for deriving square roots, can also breed knowledge if they are reliable. Although native resources must be employed to mentally represent and execute learned methods, the methods themselves need not be ‘hard-wired’.

According to reliabilism the epistemic status of a belief depends on its mode of causation (see Knowledge, causal theory of). This contrasts with purely evidentialist theories, which consider a belief to be justified as long as it is logically or probabilistically supported by a corpus of evidence that the agent possesses (see Probability theory and epistemology). Reliabilism contends that mere possession of strong evidence is not enough for justified belief. A detective, for example, may possess assorted strands of evidence that jointly incriminate a certain suspect, but the slow-witted detective may not notice that these disparate strands of evidence can be woven into an airtight case. If the detective is prompted to accept the suspect’s guilt for entirely different and illegitimate reasons - for example, the suspect’s unsavoury appearance - then the belief is unwarranted.

Not only is mere possession of adequate evidence insufficient for justification, but it is also unnecessary. At least the *current* possession of adequate evidence is not required for justification. Suppose you once had excellent evidence for *p* (having heard it from a trustworthy source) but you no longer recall this evidence: your belief in *p* may still be justified. A person’s failure to keep track of his original evidence does not destroy the justifiedness of a belief, as long as the belief in fact had a suitable provenance, namely a history of reliable belief-forming and belief-preserving steps.

2 Reliabilism as a species of externalism

Reliabilism is a species of epistemological externalism rather than internalism (see Internalism and externalism in epistemology). Although there is no unanimity in defining these terms, the rough idea is that a theory is internalist if and only if all of the factors it requires for a belief to be justified are directly accessible to the cognizer, whereas a theory is externalist if and only if some of the justificatory factors are beyond the cognizer’s (direct) ken. Since neither the truth-propensity of a belief-forming process nor the history of a belief’s acquisition is directly accessible to the cognizer, reliabilism is a form of externalism. Externalism is often criticized for departing from traditional epistemology, which is allegedly internalist. It is debatable, however, whether the dominant tradition in epistemology is really internalist. In fact, many historical epistemologies can be interpreted as having strong elements of reliabilism, including the epistemologies of Plato, Descartes, Hume, Reid and Peirce - see, for example, Schmitt (1992).

Historical epistemology aside, it is clear that the concept of knowledge (as contrasted with justification) has externalist elements. First, knowledge requires the truth of what is known, and truth is the quintessential externalist element. Second, a satisfactory solution to the Gettier problem about knowledge seems to require a further externalist component (see Gettier problems). For example, a person might have a justified belief that the object they see in the nearby field is a barn, and this may be true. But if, entirely unknown to them, there are papier-mâché barn facsimiles in the neighbourhood which they would mistake for a barn if one of them were there

instead, then intuitively they do not know what they see to be a barn. This seems to show that the external situation of the cognizer, and not just their internal mental condition, is relevant to the possession or non-possession of knowledge. The reliabilist theory of knowledge covers this by saying that knowledge is only acquired when all relevant alternatives are excluded, and the external situation - such as the presence of papier-mâché facsimiles in the neighbourhood - helps to determine which alternatives are relevant.

Although knowledge clearly has externalist components, the concept of justification may yet be thoroughly internalist, as internalists contend. But what, more precisely, is required by internalism? The typical internalist requirement of cognitive accessibility can be interpreted in at least two ways: as requiring that the believer actually should be aware of the justifying factors (at the time of the belief), or as requiring only the capacity to become aware of these factors by appropriate focusing of attention, without any change of position, new information, and so on. Either of these criteria, however, is probably unsatisfiable by many traditional theories of justification. One brand of coherentism, for example, says that a belief is justified only if it coheres with the totality of the cognizer's other current beliefs (see Knowledge and justification, coherence theory of). The justifying factors in this theory cannot meet the direct-accessibility requirement (in either version) because it is psychologically impossible to retrieve and examine the totality of one's beliefs. The beliefs of a normal adult number in the thousands or even millions, are mostly stored in long-term memory and are often difficult to recall without appropriate retrieval cues. Furthermore, many brands of coherentism, as well as other forms of evidentialism, impose complex demands in terms of the probabilistic relations that a justified belief must bear to the background corpus of beliefs. Whether a target belief satisfies these demands is not readily accessible to ordinary people who lack training in probability theory. So coherentism, no less than reliabilism, will turn out to be a brand of externalism.

Is it so bad for a theory of justification to be externalist? A common objection is that externalism, at least in its reliabilist incarnation, renders mistaken classifications. Imagine a person with a reliable clairvoyance faculty, who occasionally forms beliefs 'out of the blue' (that is, unguided by any sense-like appearances) about properties and locations of far-off objects; and these are usually correct. This person never checks up on these beliefs, and therefore has no independent evidence that the faculty is reliable; or we may suppose that the person has evidence to the contrary. Would a clairvoyantly-formed belief of that person's be justified? Reliabilism in its simplest form says yes, because the belief would be caused by a reliable process; but critics reject this assessment as intuitively mistaken.

Reliabilists may respond by complicating their theory. A standard gambit is to add a 'non-undermining' requirement, namely, a provision that the cognizer must neither believe nor possess evidence supporting the proposition that the target belief is *un*reliably caused (see Knowledge, defeasibility theory of). In at least one version of the clairvoyance case, the agent has evidence against his possession of a (reliable) clairvoyance faculty. This might give him evidence that his belief is unreliably caused (since it has no other familiar mode of causation), which would violate the new requirement. Even in the variant of the example in which the cognizer merely lacks positive evidence in support of his possessing a clairvoyance faculty, it might be argued that background scientific information makes the existence of such a faculty highly improbable; so if one lacks specific evidence of this power, the overall evidence cuts against it. The non-undermining condition would again be violated, and hence the revised version of reliabilism would declare the belief to be unjustified. Addition of the non-undermining condition does not transform reliabilism into a form of internalism, for it retains the reliability element that would violate the direct-accessibility requirement.

Whereas the clairvoyance counterexample tries to show that reliability is not sufficient for justification, a second type of objection claims that it is not necessary. Imagine a person regularly deceived by a Cartesian demon. They have the same patterns of sensory experiences as you or I, but in this case the resulting perceptual beliefs are systematically mistaken. Despite the unreliability of their perceptual belief-forming processes, surely their beliefs are as justified as yours or mine, since subjectively the grounds for belief are exactly the same. This challenges the very core of externalism by suggesting that only subjective, internal factors matter to justification, not external ones.

Reliabilists may respond by first pointing out that reliabilism also makes internal factors such as sensory experiences and background beliefs relevant to justification. These internal states are the inputs to mental

processes, and only in combination with them can mental processes yield accurate output-beliefs. Furthermore, mental processes themselves are internal events, so reliabilism cannot justly be accused of ignoring internal matters completely. But these points do not blunt the force of the objection. After all, reliabilism does appeal to 'external' truth-ratios to distinguish justified from unjustified beliefs, and yet the demon case seems to show that this appeal is misplaced.

The objection assumes, however, that the reliability of a process is assessed by its performance in the world of the example. If this assumption is correct - if reliability is determined by a process's performance in the example world - then reliabilism does imply the unjustifiedness of the demon-world beliefs. But some alternate interpretations of reliability might be proposed under which the epistemic status of the beliefs (as judged by reliabilism) may be different. For example, a reliabilist might propose that what counts is reliability in the *actual* world. Since perceptual belief-formation is reliable in the actual world, use of the same process or processes would yield justified beliefs even in a demon world. This particular reformulation of reliabilism may not quite succeed, but it shows how reliabilism has greater flexibility than might initially be supposed.

A third kind of problem for reliabilism - one not directly related to the internalism-externalism issue - is the 'generality' problem. Reliabilism says that a belief's justificational status depends on the truth-conduciveness of the psychological processes that cause it. But processes can be individuated in many ways; indeed, each token belief can be viewed as the outcome of numerous process types of differing grain or generality, with widely varying truth-ratios. What principle selects the appropriate process type, or set of process types, for each case?

3 A variant form of reliabilism

In light of these problems, different variants of reliabilism have been proposed. Let us examine one such variant and see how it addresses two of the foregoing problems. As a preliminary point, we should be clearer about what is expected of a theory of knowledge or justified belief. On one approach, such a theory should reveal the 'nature' or 'essence' of knowledge or justification, where these are construed as something like natural kinds, independent of our human conceptualization of them. On another approach, the aim of a theory is to reveal the concepts or mental representations associated with these epistemic predicates, and to reveal the ways that these representations are deployed by epistemic evaluators when they make epistemic judgments. This latter approach is the one that is pursued here.

The form of reliabilism considered in this section starts with a familiar idea in cognitive science, namely that a great deal of cognitive activity consists of 'pattern matching'. A pupil doing algebra problems, for instance, will try to match a new problem with some familiar pattern or structure of problems. It is much easier to solve a problem with a familiar solution pattern than an entirely novel one. The view considered here is that epistemic evaluation similarly proceeds by pattern matching. Evaluators are assumed to represent, in their heads, various patterns (or prototypes) of belief formation, some categorized as good patterns and some as bad. Examples of good patterns might include the use of various types of perception and the use of the 'straight rule' in inductive reasoning (see Theoretical (epistemic) virtues §1). Examples of bad patterns might include forming beliefs by guesswork and ignoring relevant evidence. Good patterns may be called epistemic 'virtues' and bad patterns epistemic 'vices'. The present hypothesis is that when an evaluator is presented with a real or imagined case of belief, they consult their mentally stored list of virtues and vices, and judge the belief to be justified or unjustified by seeing whether its own mode of production matches virtues or vices. If its mode of production matches virtues only, it is categorized as justified; otherwise it is categorized as unjustified. If a mode of production is unfamiliar or non-standard, the epistemic judgment will depend on the judged similarity of the process to the antecedently stored patterns of virtue or vice.

How would this approach apply to our previously discussed examples? In the demon-world case, beliefs are produced by standard perceptual belief-forming processes. So these are matched to patterns that are clearly virtues. In the clairvoyance cases, matters are somewhat less clear. In one version of this case, the epistemic agent is described as having evidence against possessing a reliable clairvoyance power; but they apparently ignore this evidence, since they still rely on the clairvoyance faculty. If ignoring relevant evidence is on an evaluator's list of epistemic vices, it is predictable that the evaluator would judge the belief to be unjustified. Furthermore, the process of clairvoyance might seem very similar to a process of guesswork, since there are no appearances or sensory presentations associated with clairvoyance as there are with sight, hearing, smell and so forth. Thus, a

clairvoyantly formed belief might be assimilated to the 'vice' of guesswork, and judged to be unjustified on that basis.

Thus far, nothing in the present approach invokes reliability. The reliability element is now introduced to explain how 'patterns' come to be classified as good or bad. The theory suggests that evaluators form opinions about the truth-ratios associated with sundry belief-forming processes. Those thought to have high truth-ratios are treated as good patterns and those with low truth-ratios as bad patterns. Thus, reliability is the criterion to which evaluators appeal in establishing patterns as good or bad. Evaluators might not do this purely individually. They might inherit some evaluative prototypes from others in the linguistic community. Whether individually or socially, however, the good and bad prototypes are selected by considerations of (judged) reliability.

The theory that emerges, then, is a two-level theory, somewhat analogous to rule-utilitarianism (see Utilitarianism §3). Judgments of justifiedness in particular cases do not appeal directly to the reliability of the belief's generating processes. Rather, such judgments involve pattern-matching to stored prototypes of good and bad belief-generating processes. Reliability enters the theory as the basis for classifying these processes as epistemically good or bad.

Recalling the demon-world example, it may be asked whether the basis for process evaluation is performance in the actual world or performance in other possible worlds as well. Presumably, evaluators appeal to real-world track records in making their evaluations, but they may also tend to assume that these observed track records can be extrapolated to non-observed and non-actual cases. In general, it is doubtful that ordinary evaluators, who lack ways of thinking systematically about 'possible worlds', use any sharply defined, world-relativized basis for reliability assessments. The crucial point, however, is that evaluators do not directly apply reliability considerations to novel cases. According to the present theory, they do not say (or think): 'Since perception is unreliable in the demon world, therefore perception-based beliefs in that world are unjustified'. Instead, they use pattern-matching to previously entrenched prototypes to arrive at an epistemic assessment of the target belief. With this understood, we have a form of reliabilism that has notable success in explaining evaluators' judgments in 'hard' cases, that is, cases that are hard for simple reliabilism.

Religion and epistemology

Epistemology is theory of knowledge; one would therefore expect epistemological discussions of religion to concentrate on the question as to whether one could have knowledge of religious beliefs. However, discussions of religious belief have tended to focus on arguments for and against the existence of God: the traditional theistic arguments on the one hand and, on the other, such arguments against the existence of God as the argument from evil.

To see why, we must think about evidentialism with respect to religious belief ('evidentialism' for short), the doctrine that a religious believer must have evidence for their beliefs if they are to be rationally justified. In particular, they must have propositional evidence: evidence from other things they believe, evidence that can be put forward in the form of argument. And going with evidentialism is the evidentialist objection to religious belief: the objection that religious belief is unjustified because there is not enough evidence for it. Evidentialism begins with the classical foundationalists René Descartes and (especially) John Locke. According to Descartes and Locke, some beliefs are certain for us. There are two kinds of certain belief: first, self-evident beliefs, such as ' $2 + 1 = 3$*', and second, beliefs about one's own mental life, such as 'it now seems to me that I see a hand'. According to Locke, I am, of course, clearly justified in accepting those beliefs that are certain; indeed, it is not within my power to reject them. For any belief that is not certain, however, I am justified in accepting it only if I can see that it is probable or likely with respect to beliefs that* are *certain for me.*

What is this 'justification' and why does it matter whether or not my beliefs have it? Locke believed that human beings are rational creatures: creatures capable of forming, holding and criticizing beliefs. And rational creatures, he thought, have an intellectual duty to believe only those propositions they can see to be probable with respect to beliefs that are certain for them. This is our duty as rational agents. And justification, as Locke thinks of it, is simply the condition of being within your rights, of not having gone against your duties. You are justified in doing a given thing if it is not contrary to duty for you to do it.

Locke's view of this matter has been extremely influential among epistemologists in general and among those who think about the epistemology of religious belief in particular. Furthermore, given his views it is easy to see why there should be so much concern with proofs or arguments for the existence of God. It is not self-evident that God exists - otherwise there would be no atheists and agnostics - and of course the belief that God exists is not about one's own mental life. But then, according to this Lockean way of thinking, anyone who accepts this belief must see that it is probable with respect to what is certain for them, else they will be going contrary to their duty and deserve blame and disapprobation. And proofs or arguments are just the vehicles by means of which one sees (and shows) that a given belief is *probable with respect to what is certain.*

Evidentialism has come to seem less compelling. First, the whole history of Western philosophy from Descartes to Hume shows that there is little one can really see to be probable with respect to what is certain. If we may only believe propositions that meet that condition, then most of what we believe - that there is an external world, that there are other people, that there has been a past - will not be (or will not clearly be) justified. And second, on sober reflection it just does not seem that there really is a duty to restrict belief to what is probable with respect to what is certain.

If we step back for a broader look, we can distinguish two different kinds of question about religious belief, and two corresponding kinds of criticism or objection. First, there are the claims that religious belief - Christianity, say - is not true: it simply is not true, for example, that there is such a person as God, or that Jesus Christ is the divine son of God. We may call such an objection a de facto *objection: the claim is that the religious belief in question is false, is not factual. But there is another kind of criticism or objection as well. Here the claim is not that religious belief is false, but that whether or not it is false, it is in some way improper - unjustified, irrational or in some way not worthy of belief. The evidentialist objection to religious belief is one version of such a* de jure *criticism of religious belief, and it has been the most prominent objection. But there is another* de jure *objection that has been increasingly important. This is the objection, raised by Freud, Marx and Nietzsche, that religious belief is irrational. What does that mean? According to Freud, religious belief arises out of illusion or wish-fulfilment: we find ourselves confronted by a cruel and heartless nature that delivers pain, fear and hurt, and in the end demands our death. As a response, we (subconsciously) invent a father in heaven who loves us and is*

really in charge of nature; otherwise we would sink into depression, stupor and death.

According to Freud, therefore, religious belief arises out of illusion. And the reason this constitutes a criticism of such belief is that this mechanism of illusion is not aimed at the production of true *belief, but rather at belief that has some other, non-truth-related property - in this case, the property of enabling us to carry on in this otherwise discouraging world. It is for this reason that religious belief, on this account, is irrational.*

This is an intriguing criticism of religious belief. But perhaps the most important thing to see about it is that while it is an allegedly de jure *objection to religious belief, it is not really independent of the* de facto *question. For if Christianity is true, then Christian belief pretty clearly is not irrational in Freud's sense at all. If it is true, then indeed there is such a person as God, who intends that we should have knowledge of him; and the cognitive processes that produce belief in God and in the other truths of the Christian religion very likely have as their function the production of true belief in us. On the other hand, if Christianity is false, then it is very likely that Christian belief is not produced by cognitive processes whose purpose it is to produce true belief. This* de jure *criticism of Christian belief, therefore, presupposes that Christian belief is not true; it is viable only if Christian belief is false. If it is intended as a reason for rejecting Christian belief, it is question-begging.*

More generally, it seems that there is no sensible de jure *epistemic criticism of religious belief that is independent of the* de facto *question as to the truth of the belief in question. (The evidentialist criticism is a failure and Freud's complaint is not independent of the* de facto *question whether the religious belief in question is true.) One fairly common critical attitude towards religious belief can be expressed as follows: 'As to whether religious belief is true I am completely agnostic - but I do know this: religious belief is irrational.' The above considerations show that this attitude is at best problematic.*

1 Evidentialism

Epistemology is theory of knowledge: an inquiry into whatever it is that distinguishes knowledge from mere true belief. (For example: due to pathological optimism, you are convinced that you will win the lottery; if by some fluke it turns out you *do* win, your belief will be an example of true belief that is not knowledge.) We need a name for that quality or quantity, whatever precisely it is, that makes the difference between knowledge and mere true belief: call it 'warrant'. Then one would expect the epistemology of religious belief to centre on whether religious belief has warrant, and if so, how much and how it gets it. As a matter of fact, however, epistemological discussion of religious belief, at least since the Enlightenment (and in the Western world), has mostly focused not on the question as to whether religious belief has warrant, but on arguments - in particular, on arguments for and against theistic belief. This is the belief that there exists a person like God as conceived in traditional Christianity, Judaism and Islam: an almighty, all-knowing, wholly benevolent and loving immaterial person who created the world, created human beings in his own image, and continues to act in the world by way of providential care for his creatures.

The most popular theistic proofs or arguments have been the traditional big three - the ontological, cosmological and teleological arguments, to use Kant's terms for them - together with the moral argument (see God, arguments for the existence of). Of these, the teleological argument, the argument from design (as in Swinburne 1979), is perhaps both the most popular and the most convincing. On the other side, the anti-theistic side, the principal argument has traditionally been the deductive argument from evil: the argument that the existence of an omnipotent, omniscient, wholly good God is logically inconsistent with the existence of evil, or with all the pain, suffering and human wickedness actually found in the world (see Evil, problem of). The deductive argument has fallen out of favour over the last quarter-century as philosophers have come to think that there is no inconsistency here; it has been replaced by the probabilistic argument, according to which it is *unlikely* that there is such a person as God, given all the evil the world displays. The argument from evil is flanked by subsidiary arguments, such as the claim that the very concept of God is incoherent (because, for example, it is thought to be impossible that there be an omnipotent person, or an omniscient person, or a transcendent person who can act in the world, or a person without a body). (As we shall see below, in the nineteenth century Freud and Marx introduced a different style of argument against theistic belief, one according to which such belief is irrational in that it arises out of cognitive malfunction or wish-fulfilment.)

Which of these groups of arguments is the stronger? According to *evidentialism*, belief in God is justifiable only if

the former is stronger than the latter.

2 Evidentialism characterized

Why has discussion centred on these arguments, and why does it matter which group is stronger? Indeed, suppose there are no good arguments for religious or theistic belief at all: why should that be thought to create a problem for the believer? To see why we must understand evidentialism with respect to religious belief ('evidentialism' for short). Evidentialism has been the dominant (though not the sole) way of thinking about these matters from the Enlightenment to the present (again, in the Western world). The evidentialist thinks a person who accepts a religious belief must have evidence for that belief. In particular, they must have propositional evidence for it - evidence from other things they believe. And this is why arguments are crucially important: an argument is simply a way of organizing and presenting your propositional evidence for some belief or other. Just to simplify matters, let us follow current custom and think for the most part about theistic belief, belief in God; later we can think also about beliefs that go beyond theism, such as beliefs that distinguish Christianity from Islam and Judaism.

The evidentialist, therefore, thinks a believer in God must have evidence for that belief - but must for what? What will be the matter with them if they do not? The answer, according to the evidentialist, is twofold. In the first place, if they have no (or insufficient) evidence, then the belief will not constitute knowledge. The believer will know that there is such a person as God (that belief will have warrant for them) only if they have propositional evidence for it - only if they have a good argument for it. But the stakes here are considerably higher than that. For if the believer does not have evidence, then, according to the evidentialist, not only will they lack knowledge, they will also be unjustified in holding this belief; they will not be rationally justified.

But what *is* this justification, and why do we need it? Why is lacking it a problem? And why should the justification of theistic belief be so closely linked to the discussion of theistic and anti-theistic arguments? To answer these questions, we must go back to the beginnings of modern and Enlightenment thought on these questions, to the genesis of Locke's *Essay Concerning Human Understanding* (1689), one of the most influential sources of thought on these topics (see Locke, J. §7).

Locke lived through one of the most turbulent periods of British intellectual and spiritual history; it was in particular the religious ferment and diversity, the enormous variety of divergent religious opinion, that caught his attention. There was the Catholic-Protestant debate, and within Protestantism there were countless disagreements and controversies and many warring factions. Locke was deeply concerned about this blooming, buzzing confusion of religious opinion and the civil unrest that went with it. His *Essay* is at least in part designed to ameliorate this problem.

The source of this confusing welter of inconsistent religious opinion, Locke thought, was the propensity of people to indulge themselves in unjustified belief. But what is it to be justified (or unjustified) in holding a belief? According to Locke (as well as René Descartes (§7), the other of the twin towers of modern Western epistemology), there are epistemic or intellectual duties, or obligations, or requirements:

> Faith is nothing but a firm assent of the mind: which if it be regulated, as is our duty, cannot be afforded to anything, but upon good reason; and so cannot be opposite to it. He that believes, without having any reason for believing, may be in love with his own fancies; but neither seeks truth as he ought, nor pays the obedience due his maker, who would have him use those discerning faculties he has given him, to keep him out of mistake and error. He that does not this to the best of his power, however he sometimes lights on truth, is in the right but by chance; and I know not whether the luckiness of the accident will excuse the irregularity of his proceeding. This at least is certain, that he must be accountable for whatever mistakes he runs into: whereas he that makes use of the light and faculties God has given him, and seeks sincerely to discover truth, by those helps and abilities he has, may have this satisfaction in doing his duty as a rational creature, that though he should miss truth, he will not miss the reward of it. For he governs his assent right, and places it as he should, who in any case or matter whatsoever, believes or disbelieves, according as reason directs him. He that does otherwise, transgresses against his own light, and misuses those faculties, which were given him.
>
> (1689: IV.xvii.24)

We have a duty to regulate our belief a certain way. If we do not, we are accountable. One who regulates belief in

this way has the satisfaction of 'doing his duty as a rational creature'; such a person 'governs his assent right and places it as he should'. Rational creatures, creatures capable of holding and withholding belief, have duties and obligations with respect to the regulation of their belief or assent. And the central core of the notion of justification (as the etymology of the term indicates) is this: a person is justified in an action or belief if, in taking that action or holding that belief, they violate no duties or obligations, conform to the relevant requirements, are within their rights. To be justified in believing something is to be *responsible* in forming and holding those beliefs; it is to be flouting no duty in holding them. This way of thinking of justified belief (together with analogical extensions of one kind or another) has remained dominant from Locke's day to this.

Now Locke believed that if only everyone could be persuaded to restrict assent to those beliefs in which they were justified, we would no longer be confronted with this confusing welter of religious belief. His reasoning is as follows. A belief is justified for me, he says, just if I am within my epistemic rights, am flouting no duties or obligations in holding that belief. But what are my duties or obligations in this area? According to Locke, the central epistemic duty is this: to believe a proposition only to the degree that it is probable with respect to what is *certain* for you. Which beliefs are certain for you? There are two kinds. First, according to Locke (here again he concurs with Descartes), there are propositions about your own immediate experience that are certain for you: that you have a mild headache, for instance, or that you are thinking about dinosaurs. And second, there are propositions that are self-evident for you: necessarily true propositions so obvious that you cannot so much as entertain them without seeing that they must be true. (Examples would be simple arithmetical and logical propositions, together with such propositions as that red is a colour, and that whatever exists has properties.) Propositions of these two sorts are certain for you, and you are automatically justified in believing them; as for other propositions, you are justified in believing any one of them, says Locke, only to the degree to which that proposition is probable with respect to what is certain for you. (Here he differs from Descartes, who seems to say that you are justified in believing a proposition that is not certain for you only if that proposition follows deductively from propositions that are certain for you.) According to the whole modern foundationalist tradition initiated by Locke and Descartes, therefore, you have a duty not to accept a proposition unless either it is certain for you, or it is (at least) probable with respect to what is certain for you. If a proposition is not certain for you, you have a duty to refrain from believing it unless you have propositional evidence for it. But it was Locke's belief that if we all did our epistemic duty and believed only propositions we could see to be probable with respect to what is certain for us, we would not find ourselves in disagreement, or at least would not disagree nearly as often.

Returning to theistic belief, we can see how the above thought about justification applies. First, this belief is not certain for us: it is neither self-evident (since there are atheists and agnostics, it is not such that grasping or understanding it guarantees accepting it); nor is it about one's own mental states. Therefore theistic belief, on Locke's way of thinking, is justified only if there is propositional evidence for it - more exactly, a person is justified in accepting theistic belief only if they believe it on the basis of a good argument for it, an argument whose premises are certain for them. And this is the linchpin of the way of thinking about the justification of theistic belief that has prevailed from Locke's time to ours. Theistic belief is justified only if it is probable with respect to what is certain; it is probable with respect to what is certain only if there are good arguments for it; therefore theistic belief is justified only if there are good arguments for it. But then of course it is very easy to see why discussion of theistic belief has tended to focus on the arguments for and against theism.

Now Locke does not *argue* for this position; he simply *announces* it. Subsequent thinkers who have discussed the justification of theistic belief have for the most part followed him here, both in announcing the position and in failing to argue for it. Thus W.K. Clifford trumpets that 'it is wrong, always, everywhere, and for anyone to believe anything upon insufficient evidence' (1879: 183); his is perhaps the most prominent in a considerable chorus of voices insisting that there is an intellectual duty not to believe in God unless you have a good argument for that belief. (A few others in the choir are Brand Blanshard (1974: 400-), H.H. Price, Bertrand Russell and Michael Scriven.) According to all these thinkers, if you accept theistic belief without having a good argument for it, you are going contrary to epistemic duty, are therefore unjustified in accepting it, and are living in epistemic sin.

3 Evidentialism criticized

It is widely thought that there are several important problems with this approach to the epistemology of theistic

belief. First, the standards for theistic arguments have traditionally been set absurdly high (and perhaps part of the responsibility for this must be laid at the door of some who have offered these arguments and claimed that they constitute wholly demonstrative proofs). The idea seems to be that a good theistic argument must start from what is self-evident or utterly obvious and proceed majestically by way of self-evidently valid argument forms to its conclusion. It is no wonder that few if any theistic arguments meet that lofty standard - after all, almost no philosophical arguments of any sort meet it.

Second, attention has been mostly confined to three theistic arguments: the traditional ontological, cosmological and teleological arguments. But in fact there are many more theistic arguments. For example, there are arguments from the nature of proper function, and from the nature of propositions, numbers and sets. There are arguments from intentionality, from counterfactuals, from the confluence of epistemic reliability with epistemic justification, from reference, simplicity, intuition and love. There are arguments from colours and flavours, from miracles, play and enjoyment, from morality, from beauty and from the meaning of life. There is even a theistic argument from the existence of horrifying evil.

But there is a third and much deeper problem. The basic assumption underlying traditional thought about the justification of theistic belief is that such belief is justified only if there is a good argument for it from other propositions you believe. But why believe that? Perhaps *some* beliefs are like that. Scientific hypotheses - special relativity or the theory of evolution, for example - are such that if you believe them without evidence you are irresponsible. For such theories have been devised to explain certain phenomena, and they get all their warrant from their success in so doing. (Even so, would you really be irresponsible in believing such a proposition without evidence, or just foolish or irrational?) But other beliefs - such as memory beliefs, or belief in other minds - are not like that at all; they are not hypotheses, and are not accepted because of their explanatory powers. Now why assume that theistic belief, belief in God, is in this regard more like a scientific hypothesis than like, say, a memory belief? Why think that the justification of theistic belief depends upon the evidential relation of theistic belief to other things one believes?

According to Locke, it is because there is a duty not to assent to a proposition unless you can see that it is probable with respect to what is certain to you; but is there really any such duty? No one has succeeded in showing that, say, belief in other minds or the belief that there has been a past is probable with respect to what is certain for us. Suppose it is not: does it follow that you are living in epistemic sin if you believe that there are other minds? Or a past? Nearly everyone recognizes such duties as that of shunning gratuitous cruelty, of taking care of one’s children and one’s aged parents, and the like; but do we also find ourselves recognizing that there is a duty not to believe what is not probable (or what we cannot see to be probable) with respect to what is certain for us? Hardly. But then it is hard to see why being justified in believing in God requires that the existence of God be probable with respect to some such body of evidence as the set of propositions certain for you. Perhaps theistic belief is properly basic - that is, such that one can be justified in accepting it without accepting it on the evidential basis of other propositions one believes.

For consider a typical Christian believer: they have been brought up as a Christian, and for the most part Christian belief has always seemed to them clearly true. While they have never looked carefully into the alleged objections to Christian belief, what they have heard of them does not seem promising; those whom they respect on these matters tell them the objections are without foundation and they accept this. Such a person, surely, is not to be censured; they are not a proper subject of moral disapprobation. They may be mistaken, deluded, even foolish; they may be insufficiently critical; but there is no reason to think them unjustified or derelict in their epistemic duties.

On the other hand, consider someone sophisticated in these matters and very well aware of the critics. This person does not believe on the basis of propositional evidence; they therefore believe in the basic way. Can they be justified? They read the critics, but on careful reflection do not find them compelling; likewise, although they are aware of theistic arguments and find some of them not without value, they do not believe on the basis of them. Rather, this person has a rich inner spiritual life; it seems to them that they sometimes catch a glimpse of the overwhelming beauty and loveliness of God; they are often aware, as it strongly seems to them, of the work of the Holy Spirit in their heart, comforting, encouraging, teaching, and leading them to accept the ‘great things of the gospel’ as Jonathan Edwards (1746) calls them. After long, hard, conscientious reflection, they find all this

enormously more convincing than the complaints of the critics. Are they then going contrary to duty in believing as they do? Are they being irresponsible? Clearly not. There could be something defective about them, some malfunction not apparent on the surface. They could be mistaken, a victim of an illusion; they could be a victim of wishful thinking, despite their best efforts. They could be wrong, desperately wrong, pitiably wrong, in thinking these things. But they are not flouting any discernible duty; they are doing their level best to fulfil their epistemic responsibilities. They are certainly justified.

Taking justification in that original etymological sense, therefore, there is every reason to doubt that one is justified in holding theistic belief only if one has evidence for it. Of course, the term ‘justification’ has undergone various analogical extensions in the work of various philosophers. Thus it is sometimes used just to mean propositional evidence; then to say that a belief is justified for someone is to say that they have (sufficient) propositional evidence for it. In that sense of ‘justified’, of course, a person will be justified only if they have evidence. But you cannot settle a substantive question just by giving a definition. If you accept that definition, then the real question is whether there is anything amiss with holding beliefs that are unjustified. Perhaps one does not have propositional evidence for one’s memory beliefs; if so, those beliefs would be unjustified in that sense, but none the worse for that; it would not suggest that there is something wrong with holding them. And the same goes for theistic belief.

4 *De facto* and *de jure*

Suppose we try to set evidentialism in a broader perspective. Ever since the Enlightenment, there have been two kinds of critical question about religious belief. On the one hand, there are those who argue that religious beliefs are false or at any rate improbable: it is at best unlikely that (say) there is such a person as God, or that, if there is, Jesus Christ is his divine Son. (Here typical arguments would include the anti-theistic arguments mentioned above.) Since this question is about the truth or factual character of Christian belief, we may call it the *de facto* question. On the other hand, there is the question of the propriety, or reasonability, or justification, or rationality, or to combine those last two, the rational justification of Christian belief. Christian belief may be true and it may be false; but even if it happens to be true, so these critics say, there are serious questions as to whether it is rational or rationally justifiable to accept it. Call this the *de jure* question. The claim that belief in God is unjustified (that is, irresponsible) because there is insufficient evidence for it, is an example of a *de jure* criticism; as we have seen, however, this claim has very little to be said for it. This claim has been the dominant *de jure* criticism of religious belief; but the nineteenth century saw the rise of another kind of *de jure* criticism, one associated with those three great ‘masters of suspicion’, Nietzsche, Freud and Marx.

Freud and Marx insisted that Christian belief is irrational. (Of course it was not only Christian belief that drew their fire). Nietzsche’s complaint could also be examined here: that religion originates in slave morality, in the *ressentiment* of the oppressed (see Nietzsche, F. §§8-9). As Nietzsche puts it, Christianity both arises from and fosters a sort of weak, snivelling, cowardly, servile and generally disgusting sort of character, which is at the same time envious, self-righteous and full of hate disguised as loving kindness. In what follows, we shall ignore Nietzsche, considering the objection Freud and Marx bring against religious belief, with the emphasis upon Freud.

5 Freud and Marx

Some of Freud’s treatment of religious belief is perhaps rather fanciful - for example, his suggestion that religion originated in a remarkable transaction among the ‘primal horde’. (The sons of the dominant male, jealous of their father because he had seized all the women for himself, killed and ate him; religion somehow emerged from the resulting guilt and remorse.) But he also makes a much more sober claim about the ‘psychical origin of religious ideas’:

> These, which are given out as teachings, are not precipitates of experience or end-results of thinking: they are illusions, fulfilments of the oldest, strongest and most urgent wishes of mankind. The secret of their strength lies in the strength of those wishes. As we already know, the terrifying impression of helplessness in childhood aroused the need for protection - for protection through love - which was provided by the father; and the recognition that this helplessness lasts throughout life made it necessary to cling to the existence of a father, but this time a more powerful one. Thus the benevolent rule of a divine Providence allays our fear of the dangers of life; the establishment of a moral world-order ensures the fulfilment of the demands of justice, which have so

> often remained unfulfilled in human civilization; and the prolongation of earthly existence in a future life provides the local and temporal framework in which these wish-fulfilments shall take place.
>
> (1927: 30)

The idea is that theistic belief arises from a psychological mechanism Freud (§4) calls ‘wish-fulfilment’; in this case, the wish is father, not to the deed, but to the belief. Nature rises up against us, cold, pitiless, implacable, and blind to our needs and desires. It delivers hurt, fear and pain, and in the end demands our death. Paralysed and appalled, we invent (unconsciously, of course) a Father in Heaven who exceeds our earthly fathers as much in power and knowledge as in goodness and benevolence; we believe he loves and cares for us. The alternative would be to sink into depression, stupor and finally death. According to Freud, belief in God is an illusion, in a semi-technical use of the term: a belief that arises from the mechanism of wish-fulfilment. But if Freud intends this as a criticism of religious belief, he must be thinking that what he says in some way discredits it, casts doubt upon it, and, in a word, shows that there is something wrong with it. So what, precisely, is the problem? We can put it by saying that religious belief (specifically theistic belief) is irrational; but what does that mean? Irrational in what way? In order to understand what is really involved in that complaint, we must make a brief excursion into the assumptions underlying the sort of criticism it represents.

It is natural to think that there are intellectual, or cognitive, or rational powers or faculties - for example, perception and memory. These powers or processes produce in us the myriad beliefs we hold. They are something like instruments; and like instruments, they have a function or purpose. If we thought of ourselves as created and designed either by a Master Craftsman or by Evolution, these cognitive faculties would be the parts of our total cognitive establishment whose purpose it is to produce beliefs in us. Their purpose, furthermore, is presumably to produce true beliefs in us; to put it a bit less passively, they are designed in such a way that by using them properly we can come to true belief. Our cognitive faculties work over an immensely large area to deliver beliefs on many different topics: beliefs about our immediate environment, about the external world at large, about the past, about numbers, propositions and other abstract objects and the relations between them, about other people and what they are thinking and feeling, about what the future will be like, about right and wrong, about what is necessary and impossible, and about God himself.

These faculties are aimed at the truth in the sense that their purpose or function is to furnish us with true belief. And like any other instruments or organs, they can work either well or ill; they can function properly or malfunction. A wart or a tumour does not function properly, but nor does it malfunction (although it might be by virtue of malfunction that the tumour is present). That is because it has no function or purpose. But an organ - such as your heart, liver or pancreas - does have a function, and does either work properly or malfunction. And the same goes for cognitive faculties or capacities: they too can function well or badly. Further, we ordinarily take it for granted that when our cognitive faculties are functioning properly, when they are not subject to dysfunction or malfunction, then for the most part the beliefs they produce are at least close to the truth. There is, we might say, a presumption of reliability for properly functioning faculties; we are inclined (rightly or wrongly) to take it that properly functioning cognitive faculties for the most part deliver true belief. No doubt there will be mistakes and disagreements, and we may be inclined to scepticism about certain special areas of belief - political beliefs, for example, as well as beliefs formed at the very limits of our ability, as in cosmology and subatomic physics - but the bulk of the everyday beliefs delivered by our rational faculties, so we think, are true.

But when our cognitive faculties malfunction, they do not fulfil their purpose of furnishing us with true belief - or if they do, it is by accident. Insanity is an extreme case of malfunction of the rational faculties. But there are more subtle ways in which irrational or non-rational beliefs can be formed in us. First, there are belief-forming mechanisms that are not aimed at the formation of true belief, but at the formation of belief with some other property - contributing to survival, perhaps, or peace of mind or psychological comfort. Someone with a lethal disease may believe their chances of recovery much higher than the statistics in their possession warrant; their so believing itself improves their chances of recovery. The function of the process producing this belief is not that of furnishing true beliefs, but beliefs that make it more likely that the believer will recover. A person may be blinded (as we say) by ambition, failing to see that a certain course of action is wrong or stupid, even though it is obvious to everyone else. Our idea is that the inordinately ambitious person fails to recognize something they would otherwise recognize; the normal functioning of some aspect of their cognitive powers is inhibited or overridden or impeded by that excessive ambition. You may be blinded also by fear, lust, anger, pride, grief, social pressure, and

even loyalty, continuing to believe in the honesty of your friend long after an objective look at the evidence would have dictated a reluctant change of mind.

So there are at least three ways in which a belief can fail to be a proper deliverance of our rational faculties: it may be produced by malfunctioning faculties, or it may be produced by cognitive processes aimed at something other than the truth, or the proper function of rational faculties can be impeded and overridden by lust, mother love, ambition, greed, grief, fear, low self-esteem and other emotional conditions. And here we come to the heart of Freud’s objection: when Freud says that theistic belief is irrational, his basic idea is that belief of this sort is not produced by the unimpeded proper function of belief-producing processes whose purpose it is to furnish us with true belief. This means that the presumption of reliability attaching to properly functioning cognitive faculties does not apply to the processes that yield belief in God. The idea is that theistic belief has a source distinct from those of our faculties that are aimed at the truth - or, if such belief does somehow issue from those truth-aimed faculties, their operation, in producing such belief, is impeded by other factors. It is therefore irrational; and it is also irrational in the further sense that it is inconsistent with rational belief. For this reason the presumption of reliability does not attach to religious belief.

Marx’s views differ from Freud’s here in an interesting way. Marx (§3) thinks that religion arises from cognitive malfunction: ‘Man is *the world of man*, the state, society. This state, this society, produce religion, *a perverted world consciousness*, because they are a *perverted* world’ (Marx and Engels [1844] 1964: 41-2; original italics). So Marx’s idea, fundamentally, is that religious belief is produced by *malfunctioning* cognitive faculties - malfunctioning in response to social and political malfunction. Freud, on the other hand, thinks theistic belief is an *illusion* in his special sense of a cognitive mechanism that is aimed, not at the truth, but at psychological wellbeing. But illusions have their functions; they may serve important ends (such as the end Freud thinks religious belief does serve). When our cognitive faculties produce illusions, therefore, they are not necessarily malfunctioning. So Marx thinks theistic belief is the product of malfunctioning cognitive faculties, whereas Freud thinks it is the product of cognitive processes not aimed at the truth. They concur in thinking that theistic belief is irrational in the double sense that it is not produced by unimpeded properly functioning cognitive faculties aimed at the truth, and it runs counter to the deliverances of our rational powers. As Freud puts it, religious belief is ‘patently infantile’, and ‘foreign to reality’.

6 The religious riposte

Of course, Christians and other theists will not agree that theistic belief is irrational in this sense; they will have their own views as to how it is that belief in God is formed, their own candidates for the sources of belief in God. Thomas Aquinas (§11), for example, speaks of a ‘natural (and confused)’ knowledge of God. John Calvin (§2) develops this idea, suggesting that we human beings have a *sensus divinitatis* (a sense of divinity) whereby under a wide variety of circumstances - danger, perception of the beauties and wonders of nature, perception of our own sinful condition - we form true beliefs about God. The *sensus divinitatis*, according to Calvin, is a natural, inborn faculty with which human beings have been created; in this respect it resembles perception, memory, reason and other cognitive faculties. What is important in all these views is that our beliefs about God are produced by cognitive faculties aimed at the truth and functioning properly; hence on these views such belief is not at all irrational in the sense intended by Freud and Marx.

There is a complication here: according to Christianity, our natural knowledge of God has been compromised by sin, which has cognitive or noetic as well as moral and spiritual results. As a result, God, as Anselm says, is obscured by the smoke of our wrongdoing. But (again, according to Christianity) God has made a gracious response to our human sinful condition. There is the offer of salvation and eternal life, available through the sacrificial death and resurrection of Jesus Christ, the divine Son of God. But there is also a cognitive component to the divine response. This is God’s providing a way by which we human beings can come to know and appropriate the gracious offer of salvation. Here Christians will think of the Scripture, the Church, and perhaps above all, the inward testimony of the Holy Spirit. The doctrine of the work of the Holy Spirit was developed perhaps most fully in the Reformed tradition and in particular by the great Puritan divines. According to John Calvin, the principal work of the Holy Spirit in the life of a Christian is the production of faith, which includes at the least a deep acceptance of the gracious offer of salvation, and a deep conviction of the truth of the essentials of Christian teaching. In so far as Christian belief (including belief in God) is a result of the work of the Holy Spirit, it is not a

product just of natural faculties; the activity of the Holy Spirit is supernatural. But of course it is not at all irrational in the sense of the objection from Freud and Marx: it is not produced by cognitive faculties that are malfunctioning or aimed at something other than the truth. Instead, these beliefs are produced in us (with our concurrence) by the work of God himself, as part of his gracious response to the human sinful condition. From this point of view, then, Christian faith is in no way irrational, and, indeed, is a form of knowledge (given most accounts of knowledge), so that it is an error to *contrast* faith with knowledge; for faith is one kind of knowledge.

7 *De jure* reduced to *de facto*

Freud, Marx, Nietzsche and their confrères claim that theistic belief is irrational (in the sense explained); Christians and other believers in God deny this. Who is right? Here it is important to see that this question cannot really be settled apart from the question as to whether Christian or theistic belief is true. First, it is clear that if Christian belief is true, then very likely it is rational; it is produced by unimpeded cognitive faculties functioning properly and aimed at the production of true belief. For if Christian belief is true, then we have been created by God and created in his image, one aspect of which involves our being able to resemble him with respect to knowledge. Further, God has instituted a way of salvation for human beings, and has also made available to us the means to know of and apprehend that salvation. When Christians form these beliefs, therefore, they do so by way of mechanisms that are working properly and successfully aimed at the production of true belief. So if Christian belief is true, it is rational. On the other hand, if Christian or theistic belief is false (if, for example, naturalism is true), then these beliefs constitute massive error, and it is hard to see how cognitive faculties functioning properly and aimed at the truth could produce them. Whatever mechanisms do produce them then, those mechanisms must be either malfunctioning or, like wishful thinking, be aimed at something other than the truth.

Once we see this, however, we see an important point about the version of the *de jure* criticism offered by Freud and Marx. What we see is that this question as to the rationality (or lack thereof) of Christian belief is not really just an epistemological question at all; it is at bottom a metaphysical, or theological, or religious question. For it is to be answered in terms of the answer to another question: what sort of beings are human persons, and what sorts of belief do their noetic faculties produce when they are functioning properly? Your view as to what sort of creature a human being is will determine or at any rate heavily influence your views as to what it is rational or irrational for human beings to believe. But the answer to that question depends on whether or not Christian theism is true. And so the dispute as to whether theistic belief is rational, in the present sense, cannot be settled just by attending to epistemological considerations; it is at bottom not merely an epistemological dispute, but a metaphysical or theological dispute.

You may think humankind is created by God in the image of God - and created both with a natural tendency to see God’s hand in the world about us, and with a natural tendency to recognize that we have indeed been created and are beholden to our creator, owing him worship, obedience and allegiance. You may add that the source of distinctively Christian belief lies in the work of God himself. Then of course you will not think of belief in God or Christian belief as (in the typical case) a manifestation of cognitive dysfunction or any other kind of intellectual defect; nor is it a product of some mechanism not aimed at the truth. (It is then more like a deliverance of sense perception, or memory, or sympathy - or perhaps the faculty responsible for a priori knowledge.) On the other hand, you may think we human beings are the product of blind evolutionary forces; you may think that we are part of a Godless universe. Then you will no doubt be inclined to go along with Freud and Marx in seeing belief in God as either a product of cognitive dysfunction or of a mechanism whose function is not that of the production of true belief. If you adopt the former view, you will of course think Christian belief eminently rational; if you adopt the latter you will think it irrational. But the important thing to see is that this dispute cannot be settled by attending only to epistemology: at bottom it is a dispute about the truth of Christian belief. To determine whether Christian theism is rational, therefore, one must first determine whether it is true. But then this *de jure* question - the one associated with Freud and Marx - is not after all independent of the *de facto* question. To answer the former, we must already know the answer to the latter.

What we have seen so far is that there are fundamentally two *de jure* criticisms of Christian theism: the evidentialist objection and that from Freud and Marx. The first is easily seen to be mistaken and the second is not independent of the *de facto* question of the truth of Christian belief. But then it seems that there are not any sensible *de jure* questions or criticisms that are independent of the *de facto* question of the truth of Christianity.

And this means that the only possibly successful objections to Christian or theistic belief will have to be to the *truth* of such belief, not to its rationality, or justification, or intellectual respectability, or rational justification, or whatever. The only possibly successful objections are *de facto* objections; the *de jure* objections drop away.

Religion and morality

The relationship between religion and morality has been of special and long-standing concern to philosophers. Not only is there much overlap between the two areas, but how to understand their proper relationship is a question that has stimulated much debate. Of special interest in philosophical discussions has been the question of divine authority and the moral life. If there is a God, how are we to understand the moral status of his commands? Are there moral standards that even God must acknowledge? Or does God's commanding something make *it morally binding? Secular thinkers have insisted that these questions pose a serious dilemma for any religiously based ethic: either the moral standards are independent of God's will, with the result that God's authority is not supreme, or God's will is arbitrary, which means that what appears to be a morality is really a worship of brute power. Many religious ethicists have refused to acknowledge the dilemma, arguing for an understanding of divine moral directives as expressions of the complexities and excellences of God's abiding attributes.*

The impact of religion on moral selfhood has also been much disputed. Secularists of various stripes have insisted that religion is not conducive to moral maturity. Religious thinkers have responded by exploring the ways in which one's notion of moral maturity is shaped by one's larger worldview. If we believe that there is a God who has provided us with important moral information, then this will influence the ways we understand what is to count as a 'mature' and 'rational' approach to moral decision making.

Religious ethicists have had a special interest in the ways in which worldviews shape our understandings of moral questions. This interest has been necessitated by the fact of diversity within religious communities. Different moral traditions coexist in Christianity, for example, corresponding to the rich diversity of theological perspectives and the plurality of cultural settings in which Christian beliefs have taken shape. This complexity has provided some resources for dealing with the 'postmodern' fascination with moral relativism and moral scepticism.

The relationship between religion and morality is also important for questions of practical moral decision. Religious ethical systems have often been developed with an eye to their 'preachability', which means that religious ethicists have a long record of attempting to relate theory to practice in moral discussion. The ability of a moral system to provide practical guidance is especially important during times of extensive moral confusion.

1 God and moral authority

It is not surprising that philosophers have devoted considerable attention to the relationship between religion and morality. Both areas of discourse address the issue of how people are to order their lives so as to promote human flourishing in the light of 'ultimate concerns'. The relationship is also one that easily generates controversies. The notion that morality has a close link to religion has been deeply offensive to those philosophers who have wanted to protect the 'autonomy' of ethics. Their passion in addressing the topic has often been matched by those philosophers who have been convinced that the moral life requires a commitment to 'absolutes' that can only be provided by a religious perspective.

Religious activity extends, of course, well beyond the range of specifically moral concerns. Believers have typically insisted, however, that religious teachings provide the larger context in which the claims of morality find their proper place. Most religious systems portray the good life, including the morally good life, as grounded in obedience to the will of God. (Some religious perspectives are polytheistic, and a few are even properly characterized as atheistic; here, however, we will focus on monotheistic religion (see Atheism §1; Monotheism §§1-2).) It is often argued from a religious perspective that the moral convictions of all human beings, whether or not they consciously acknowledge God's moral authority, presuppose, or are in some other sense dependent upon, a divinely instituted moral ordering of reality. Philosophers who have been critical of religious belief as such have often focused on this alleged connection in arguing for the independence of morality from religious teachings.

The terms of the debate over these issues were established early on in the Western philosophical tradition, when Plato asked in the *Euthyphro* whether the gods themselves must honour the standards of 'the pious or holy'. The issues at stake here have loomed large in philosophical discussions of religion and morality. Are there standards of goodness and obligation that even God must acknowledge, since they are independent of the divine will? Or are we to view divine directives as morally binding simply because they are willed by God? For many religious

thinkers, neither option has been especially attractive as stated. If moral standards have their own reality, independent of the divine will, then God's supreme moral authority is called into question. If, on the other hand, moral standards are themselves created by God, then the divine will would seem to be arbitrary: God could have created a moral order that conflicts in very basic ways with the convictions acknowledged by existing religious systems (see Voluntarism).

Philosophical critics of religious belief have persistently pressed these points. On occasion, they have done so in the hope of demonstrating the basic incoherence of any attempt to provide a religious grounding for morality. If God's will is viewed as arbitrary, then it is difficult to see, the argument goes, how we can rescue the *moral* enterprise. In such a universe, human obedience to divine directives is essentially a subjection to brute power; here, it would seem, duty and moral deliberation have no obvious role to play. Some believers have been willing to concede this point. Peter Geach once gave a blunt answer to the charge that obedience to the will of God is 'plain power worship': indeed it is, he responded, 'but it is worship of Supreme power, and as such is wholly different from, and does not carry with it, a cringing attitude toward earthly powers' (1969: 127).

Many religious ethicists have stopped short of that kind of unnuanced understanding of the situation. In formulating their alternatives, they have generally opted for one of two strategies. The first is to defend a *compatibilist* perspective. Here it is argued that the acceptance of religiously based ethical directives is compatible with adherence to a more generally accepted philosophical perspective. A number of major philosophical ethicists have encouraged such an approach. For example, Jeremy Bentham (§2) defended the ultimacy of the utilitarian principle by attempting to show that the principle of utility was simply an explication of that which is accepted by all human beings, 'wheresoever they have a clear view of their own interest'. He immediately applied this to religious believers: those who submit to the commands of God are aiming at that kind of personal happiness that can best be attained 'by God's appointment, either in this life, or in a life to come' ([1823] 1961: 40). Similarly, John Stuart Mill (§§8-11) attacked the notion that utilitarians advocate 'a *godless* doctrine' by suggesting that to submit to the will of a God who wants his creatures to be happy is to 'fulfil the requirement of utility in a supreme degree' ([1861] 1961: 423). Adopting a very different approach to moral justification, Immanuel Kant (§§9-11) held that many of the moral directives found in the Bible can be viewed as conforming to the categorical imperative. Ethicists working within specific religious traditions have sometimes seized on the opportunities offered by such accounts, arguing that engaging in religious moral practices is quite consistent with the acceptance of one or another of the perspectives in the philosophical tradition. One of the more sophisticated attempts along these lines can be found in William Frankena's 'Ideal Observer' theory of moral justification (Frankena 1976). Frankena contends that in the making of moral judgments we are implicitly claiming a consensus for what we are advocating: to say that something is right or good is to insist, in effect, that we would be sustained in our verdict by everyone who takes the moral point of view, and who thinks about the subject in a clear-headed and rational way in the light of all relevant facts. In short, as Frankena puts it, it is to insist that our position is the one that would hold up on 'the Day of Judgment'. This is not to prove, of course, that the making of moral judgments entails the existence of a divine Judge. But it does suggest that a wise, omniscient and benevolent deity would be in the best position to determine questions of moral value.

A second strategy is to take a *distinctivist* approach, portraying religious ethics as a unique alternative to the standard options in philosophical understandings of moral justification. On such a view, God is not simply a Platonic contemplator of rationally discernible ideals, nor is he a utilitarian calculator, a Kantian universalizer or an Ideal Observer. None of these philosophical perspectives, it is insisted, can do justice to God's moral authority as we experience it from within the religious life. A common line of argument here is that God's will is not arbitrary, but is an expression of his attributes. For example, Eleonore Stump and Norman Kretzmann (1991) have defended such a view by appealing to Thomas Aquinas' thesis that God is essential goodness itself; on this understanding of God's nature, the relationship between God and moral principles is neither one of subjective divine arbitrariness nor of God subscribing to standards that are independent of the divine nature (see Simplicity, divine).

A 'third way' approach of this sort points to the need for a somewhat fluid understanding of the process of moral formation. To the obvious question, for example, of how we know that God's attributes are morally good unless we employ some independent standard of moral value, the answer can be given that the ways in which we learn, refine and employ moral standards and beliefs are complicated. The adult convert to a religious perspective surely

brings certain moral notions to the initial encounter with God; but these notions can themselves be transformed as the person internalizes a new and complex belief system. In such a process, it is not always clear where we apply ‘independent’ standards of evaluation in assessing divine directives and where we submit our previous moral commitments to divine scrutiny for correction and even transformation. Basil Mitchell makes this case by observing that while submission to God’s moral authority does require that ‘we can recognize what is excellent’, it surely is not the case ‘that the only sufficient reason for believing God to be good is our own ability, independently, to think up the divine decrees for ourselves’ (1980: 150).

2 Moral maturity

Critics of religiously based moral perspectives have not only focused on divine moral authority. They have also objected strenuously to the notion that submission to divine authority is a way of promoting human flourishing. The objection takes many forms. Some have argued that a morality based on obedience to a divine will is ‘infantile’ (Patrick Nowell-Smith 1966); others see it as ‘prehuman’ (Erich Fromm) or ‘bad faith’ (Simone de Beauvoir), or as promoting a ‘loss of self’ (Karl Marx (§3)). These various formulations embody a common core objection: that the posture of obedience to a will that is ‘external’ to, or ‘higher’ than, one’s own is an impediment to human flourishing. Moral maturity requires the development of a healthy sense of freedom, as autonomous selves chart their own moral courses without coercion. To accept God’s moral directives, however ‘benevolent’ they might be, is destructive in a very fundamental way to the moral enterprise.

One prominent religious response to this analysis is to challenge the ways in which concepts such as autonomy and maturity are being used. Autonomous selfhood does not require the creation of moral principles and values *ex nihilo*. It is enough to take responsibility for the standards one accepts and the decisions one makes. And such a sense of responsible freedom is not alien to a life that centres on obedience to the will of God. For example, the biblical notion of the ‘covenantal’ framework for the believer’s relationship to God highlights the importance of responsible selfhood in the religious life.

Obedience to the divine will can be viewed as an important manifestation of moral maturity. To be a mature person requires a willingness to take the facts seriously. If one happens to believe that God in fact exists, and is infinitely greater than human beings in his knowledge, goodness and power, then it would be immature, even self-deceptive, to ignore God’s moral greatness. If God is in fact a loving Creator, who desires that human beings experience the divine peace, then to serve such a God is to realize new dimensions of mature human selfhood. Someone might insist, of course, that the factual claims that are basic to a religious perspective - that there is a God, that God has revealed important information about moral reality, that human beings are sinners who are very much in need of moral guidance - are so outlandish that their endorsement is itself a sign of immaturity. While these are important issues to raise, to do so is to shift the discussion away from specifically moral themes to more general philosophical topics having to do with the ways in which we form and justify our beliefs.

A religious understanding of morality, then, cannot be criticized without also challenging the larger complex of beliefs with which it is intimately associated. To criticize such a perspective in the name of autonomy or moral maturity only raises broader questions about the ‘thick’ theoretical frameworks in which those terms can be understood. Ultimately, one is led to issues that have to do not only with the existence and nature of the deity, but with the contours of the human condition, the character and extent of divine revelation, the proper locus of moral authority, and the ways in which religious teachings actually bear on the rich diversity of human practices.

3 Morality and worldview

Religion and morality interact in many different ways. For one thing, the moral universe of the believer is typically more densely populated than it is for other perspectives: even if the believer is, for example, a fairly straightforward utilitarian in their understanding of moral justification, they would still have to take the concerns of saints and angels, to say nothing of God, into account in ascertaining what will promote ‘the greatest good for the greatest number’. Believers also regularly operate with a lengthier sense of the temporal context for thinking about the implications of moral activity, since in most religious traditions moral decisions have eternal significance. Religious teachings are also narratively rich: the believer is provided with abundant examples of spiritual saints, heroes, heroines and villains, stories of people who live out their moral lives in response to a variety of challenges and temptations. These same narratives provide the believer with an expanded sense of what

is morally possible: the belief in miracles and a Final Judgment, and a sense of access to divine sources of strength and blessing, can have an important impact on moral motivation.

If these 'thick' relationships are to be explored properly, the philosophical discussion of religion and morality cannot be confined to formulating philosophical responses to the critics of religious ethics. What is also required is the more positive, constructive task described by Marilyn McCord Adams (1988): she has challenged Christian philosophers to engage in a 'mapping of… alternative positions' that will inevitably lead to the 'mounting of theological theories' about the nature of 'moral value and the human good'. For some religious ethicists, this more constructive dimension of their work has been partially fulfilled by demonstrating the ways in which a religious understanding of morality can be seen as more comprehensive, and/or more satisfactory, than the secular ethical alternatives. One common strategy is to portray non-religious schools of thought as emphasizing, in a reductionistic manner, some aspect of morality that is an integral component of a larger religious scheme. Thus deontologists are attempting to account for what religionists view as God's 'intrinsic' ordering of moral reality; utilitarians are sensitive, albeit in a distorted manner, to the moral universe's divinely ordained *telos*; secularist treatments of virtue and moral character are probing the contours of the Creator's designs for human flourishing; and so on. Some religious ethicists, especially in the Christian tradition, have also delineated the ways in which the biblical call to a life of self-giving love offers a richer understanding of the good life than any non-religious alternative theory.

The mandate to engage in more constructive efforts has also motivated many religious ethicists to explore a rather broad interdisciplinary territory, looking at the ways in which the general patterns of 'the good life' relate to even larger philosophical and theological topics. One way of viewing this broader constructive endeavour in moral thought is to see it as an exercise in a more expanded understanding of the scope of the work of philosophical theologians. Philosophical theology has often been construed too narrowly, as a discipline that focuses exclusively on epistemological questions regarding faith and reason, and metaphysical questions about the nature of God. Philosophical theology can be viewed more broadly, as encompassing the whole theological curriculum, so that it addresses philosophical topics relating to biblical studies, human nature, evangelism and the like. In this sense, moral philosophical theology can be treated as a sub-discipline of philosophical theology, just as moral theology is seen as a sub-discipline of theology proper in standard theological curricula.

Needless to say, these topics are much debated among theologians. The constructive task of religious moral thought, then, must pay considerable attention to the different ways in which specific theological perspectives shape understandings of moral topics. The ethics of Reform Judaism, for example, differ significantly from the moral teachings of the Hasidim. Similar differences exist within, say, Buddhism and Islam. Comparative moral thought has, in fact, been a major preoccupation of Christian thinkers. The Eastern and Western Churches developed divergent understandings of the metaphysics of 'spirit' and 'matter', which has led to alternative prescriptions regarding many significant moral issues (see Sanctification §§1-2). Within Protestantism, to cite just one contrast, thinkers in the Anabaptist tradition have developed an ethical perspective that emphasizes 'simple living' and pacifism, whereas those in the Calvinist tradition have often emphasized 'work ethic' themes and a 'just war' perspective on the use of violence. In Roman Catholicism, where ecclesiastical authorities officially function as a moral magisterium, a significant body of practical moral teachings has been developed, although the fostering of a variety of special 'religious communities' (Benedictine, Dominican, Franciscan, Jesuit, Carmelite, and the like) has also resulted in a diversity of spiritualities (contemplative, activist, eremitic, liberationist, and so forth) that correspond, in turn, to differing patterns of living.

The comparative study of diverse moral perspectives within religious traditions has also focused heavily on cross-cultural issues. Again, this has been a special emphasis within the Christian community, where the phenomenon of 'contextualization' has been emphasized by thinkers who want to draw sympathetic attention to the different ways in which the Christian message is received, appropriated and interpreted in a variety of cultural contexts. Moral matters have loomed large in these investigations, especially when missionary efforts have forced Christians to think about how cultural factors contribute to the shaping of moral differences, even when there is a common core of religious convictions.

The question, though, of how a traditional religious moral outlook can shed light on 'postmodern' discussions of moral relativism and moral pluralism raises new challenges for philosophical theology. The widespread conviction

that ‘the Enlightenment project’, with its strong assumption of the sufficiency of autonomous human reason to address basic issues of human concern, has failed to deliver on its promises, has generated a quest for alternatives. For some, both in academia and popular culture, this has stimulated a renewed interest in ‘pre-modern’ metaphysical schemes; for others, it has meant some sort of fundamental accommodation to radical pluralism, whether in the form of a thoroughgoing, ‘deconstructing’ epistemological and moral scepticism, or a more modest advocacy of a ‘perspectivalist’ approach.

One significant attempt to address this complex of issues has been the emergence in the late twentieth century of a strong interest in the role of ‘narrative’ in the moral life. This interest has been especially strong among religious ethicists. In his elaboration of a Christian narrativism, Stanley Hauerwas (Hauerwas and MacIntyre 1983) has been very explicit about the anti-Enlightenment motives at work. We are not ‘noumenal selves’ who best actualize our natures by formulating moral universals that strip us of our particularities; rather we are ‘historically formed’ communal beings whose selfhood is realized only in the telling of our particularized narratives. The good life, as Hauerwas views it, is most effectively attained when we immerse ourselves in communities whose narratives embody social practices that enable us to be ‘faithful to the one true God of the universe’.

An important question for religious narrativism is, of course, how we know which communities are the ones whose practices are ‘true’ to the will of God. In addressing this question, religious narrativists refuse to join those who express great scepticism about the plausibility of ‘meta-narratives’. They insist on the importance of formulating a ‘larger story’ that makes sense of more particular stories - where ‘making sense of’ includes the ability to expose weaknesses and inadequacies. Here divine revelation is viewed as a resource that provides not primarily a set of commands or moral principles, but a larger worldview, embedded in an elaborate narrative of God’s dealings with humankind.

Discussions of the larger context for understanding the relation between religion and morality have also been strongly influenced by developments in feminist thought. Unlike nineteenth-century feminist reformers, who often took traditional theism for granted in their campaigns for equality, the emergence of feminism in the twentieth century featured a critical re-examination of widely accepted metaphysical and epistemological assumptions. Many issues raised in these explorations focused on topics fundamental to a religious understanding of reality. Some feminists argue, for example, that any notion of a ‘hierarchy’, including the idea that God has transcendent being and power ‘over’ humankind, is designed to reinforce gender oppression.

To be sure, not all feminist thought is critical of divine authority or religious transcendence as such. But even where feminist philosophers and theologians have worked within the general contours of a traditional religious perspective, they have probed deeply entrenched patterns of construing some basic moral themes. In doing so, they have called attention to long-neglected thinkers, such as medieval women mystics, and highlighted less ‘masculine’ motifs (the ‘ethics of care’, relationality) in religiously based moral reflection (see Feminist ethics; Feminist theology).

4 Practical ethics

The relationship between religion and morality has also been highlighted in the late twentieth century by an intense concern with practical moral questions. Alasdair MacIntyre has suggested that there are ‘periods in the history of morality when the deepest moral divisions exist in areas of central human concern: social justice, war, sexuality, the uses of technology’ (Hauerwas and MacIntyre 1983: 1). When these times come, many people who are not themselves professional philosophers see a need to discuss practical moral concerns ‘with an unusual degree of articulateness and theoretical depth’, and they want very much to know what academic moral philosophy ‘has to contribute at the level of practice’. Of course, the capacity to generate practical guidance is not by itself a test of the truth of a theoretical perspective on morality. But practical relevance is certainly one factor that is to be taken into account in the overall assessment of an ethical system.

Both theologians and philosophers are notable for the degree of abstraction that characterizes their investigations. But the theological enterprise has typically been closely connected with efforts to ‘preach’ theories in popular settings dominated by practical concerns. These religious efforts have often been characterized by an unusual degree of ‘thickness’. In discussions of medical ethics, for example, religious ethicists have regularly insisted that the ‘ought’ topics addressed by medical ethics are seldom simply questions of moral rightness and wrongness.

Since they also have to do with our larger worldview, we must pay explicit attention to a broad range of philosophical and theological topics: metaphysical, epistemological and anthropological questions concerning the genesis and cessation of human life; dualistic and monistic accounts of human composition, as they touch on basic issues concerning the significance of medical treatments in the lives of human persons; and many others. What is true for medical ethics will also hold for other areas where practical moral guidance is offered, although it is not only religious believers who will insist on calling attention to these complexities. Proponents of a variety of non-religious points of view, such as Marxists, Freudians, deconstructionists and secular feminists, have their own reasons for insisting on the recognition of theoretical 'thickness'. Here, as in other discussions of moral topics, though, the religious believer has a special role in pointing to the unique and important ways in which religious questions enter the picture.

Religion and political philosophy

Political philosophy began in Athens, but the large-scale impact of religion upon it had to await Christianity. Biblical Christianity portrays human beings as subjects of a kingdom of God, destined for a supernatural end and bound to love one another. This view is potentially in tension with the demands of the various political societies to which Christians belong. The requirement of devotion to God might conflict with the allegiance that temporal government demands; human beings' attempts to attain their supernatural end can bring them into conflict with civil laws. The power and structure of the Church in the Middle Ages opened the possibility of tensions between the authority of the institutional Church and of various national states. These tensions, potential and actual, set much of political philosophy's agenda from the fourth to the fourteenth century.

The tension between membership of the kingdom of God and of an earthly polity was forcefully described by Augustine. He likened faithful Christians to pilgrims journeying through the world, who avail themselves of the peace temporal authority provides. Political thinkers of the early Middle Ages examined the conditions under which war, regicide and disobedience were permissible, and queried whether the Pope had authority over temporal rulers. Thomas Aquinas elaborated a theory of natural law according to which valid human law cannot conflict with the dictates of morality. Temporal rulers, he argued, are responsible for promoting their subjects' common good and eternal salvation.

Since the sixteenth century, political philosophy has been concerned with problems set by the religious developments that ushered in the modern period. The Reformation brought religious diversity to European nations on a large scale. It thereby raised questions about how policy could be set and unity maintained without a shared religion to provide common goals and social bonds. The seventeenth-century philosopher Thomas Hobbes opposed the toleration of religious diversity and argued that states could remain unified only if their religious unity were maintained by an absolute sovereign. John Locke, on the other hand, argued for the right to religious liberty. Locke and other liberals associated with the movement of thought known as the Enlightenment were opposed by classical conservatives such as Edmund Burke. Burke argued that human society depended upon willing adherence to traditional customs and social institutions, including an established national Church. More recently, liberalism has also been opposed by Marxism. Marxists argue that religion helps to maintain social stability under modern conditions by masking the exploitation of the working class.

Contemporary political philosophy in the English-speaking world is descended from the Enlightenment liberalism of Locke. John Rawls argues that social cooperation must be based only upon what citizens of liberal democracies can reasonably affirm under ideal conditions. Religious critics of contemporary liberalism argue that it unduly restricts religiously inspired political argument and activism.

1 Political philosophy in the Middle Ages

Classical Athens was the birthplace of systematic philosophical reflection on politics, but Greek religion made little impact upon it. There have been bodies of political thought associated with Judaism, Islam and Byzantine Christianity, but these religions too exercised little lasting influence on the development of political philosophy. By contrast, the development of the subject has been profoundly influenced by the doctrinal and institutional developments of Latin Christianity and the religions descended from it.

The Christian Scriptures portray all human beings as equal members of God's kingdom, bound to love God with their whole hearts and their neighbours as themselves. The Scriptures are also standardly interpreted as promising righteous people eternal life with God. The demands of the Christian life portrayed in the Scriptures are potentially in tension with the demands of membership of political society. Conformity with God's commands might require disobedience to human law. The demands of Christian charity may conflict with the requirements of armed military service. National unity may seem to depend less upon mutual love than upon patriotism or economic reciprocity. Laws, it might seem, are more often used to promote national purposes than eternal salvation. During the Middle Ages, the increasing power, wealth and organization of the Church paved the way for jurisdictional controversies between political authorities and the institutional Church. These controversies centred on the relative primacy of the pope and various secular rulers, the government of Church property, the power to appoint bishops, and the laws governing the clergy. Political philosophy between the fourth and the fourteenth centuries was

concerned in large part with addressing these tensions, both potential and actual.

Augustine, the fourth-century North African bishop, was the first great Christian social thinker. His political thought is unsystematic, but he frequently touched on political subjects in his greatest work, *The City of God* (413-27). There Augustine argued that political authority is inherently coercive and would be unnecessary had the Fall not occurred. Pride, Augustine thought, is the legacy of this original sin and the source of actual sin. God ordained that humans be subject to political authority in part to teach them humility. Augustine enjoins Christians not to take pride in the glory of the state to which they belong. Christians are, he said, pilgrims journeying through a sinful world as through an alien land. They are to make use of the peace earthly authority makes possible, but are not to love the things of this world. They may hold positions of authority, but ought not covet them. Political authority, Augustine argued, should sometimes be used to suppress heresy and to force schismatics to return to the Church.

The adoption of Christianity as the official religion of the Roman Empire by the emperor Constantine (*c*.275-337) and the Empire's later collapse brought the Church a power and wealth which required increasingly complex administration. This increasing organizational complexity set the stage for both conflict and cooperation between ecclesiastical and political institutions. Potential conflicts of jurisdiction between ecclesiastical and civil authorities, the power of the Pope to depose temporal rulers, and the permissibility of killing tyrants were among the subjects that engaged political thinkers between Augustine and the thirteenth century. The political thought of this period was largely occasional in character. It was more a product of immediate political circumstance than an element of larger philosophical enterprises.

Political philosophy was reinvigorated in western Europe in the thirteenth century. This occurred when the works of Aristotle were rediscovered by the Latin-speaking world and introduced into the medieval universities. Thomas Aquinas, the greatest of Aristotle's followers in the Middle Ages, was a practitioner of the method of inquiry known as scholasticism. It was characteristic of scholastics to integrate the truths they found in diverse sources into systematic wholes. Thus Aquinas sought to combine the truths he found in the Scriptures and in patristic sources with the insights of Aristotle's writings.

Aquinas touched on a number of political questions while constructing his own philosophical and theological system. In his treatment of politics, as of other subjects, he attempted to combine what he learned from Aristotle and from the Christian tradition. Thus he argued, following Aristotle (§27), that the purpose of political society is to make the good life available to its members. Political authorities, he concluded, are responsible for promoting the common good and eternal salvation of their subjects. Because he thought that political authority had these positive functions, he disagreed with Augustine's view that subjection to political authority is merely a consequence of sin.

Aquinas' most famous contribution to political philosophy is his theory of law (*c*.1270) (see Aquinas, T. §13). He argued that the precepts of human morality are found in what he called 'the natural law'. The natural law is ordained by God to lead human beings to their good and is accessible to human reason. It consists of injunctions such as 'Parents are to be honoured' and prohibitions such as 'Innocents should not be killed'. Human law, Aquinas argued, must be consistent with natural law. A law enjoining the ritual killing of the innocent, for example, would be inconsistent with the natural law. Aquinas would therefore argue that such a law is not, properly speaking, a law at all, and that no-one is obliged to obey it. Aquinas also thought that some societies - various Christian societies, for example, and the Israelites of the Hebrew Scriptures - enjoy the benefit of God's revelation. Through revelation, these societies have access to what Aquinas called 'divine law'. The divine law includes precepts about how God is to be worshipped. Authorities in societies to which God has revealed such precepts should enact laws which promote proper worship, where such laws are feasible. They also have a duty to suppress heresy where possible.

Another of Aquinas' important contributions to political philosophy is his account of the conditions under which a war is just. He argued that wars must be declared by proper authority rather than be the result of private initiative. He also agreed with Augustine that combatants must have the right motives. They ought not be moved by belligerence or desire for revenge. The war must be fought for a just cause, such as self-defence or the defence of the innocent. Finally, the damage done and casualties inflicted must be proportionate to the offence done by the enemy and must be necessary to achieve the just aims of the war.

In the fourteenth century, questions about the proper extent of Papal authority provoked bitter political controversy and philosophical debate. William of Ockham (§11) and Marsilius of Padua, a follower of Aristotle, argued for severe limitations on papal authority over political rulers and political matters.

During much of the Middle Ages, political philosophers thought of Europe as a single entity unified by religion. The common religion was Christianity, headed by the pope, whose proper relationship to various temporal rulers remained a matter of debate. The ascendancy of Holy Roman Emperors, such as Charlemagne in the ninth century and Frederick II in the thirteenth, kindled hopes for a Europe that would be politically as well as religiously unified. In such a world, it was natural for political theorists to argue that religion grounded the legitimacy of political authorities. Rulers, it was sometimes thought, derived their moral authority from the fact that they were doing God's will. Thus Charlemagne was crowned by the pope on Christmas Day. He was often portrayed holding a copy of Augustine's *The City of God* and thought of his empire as an attempt to realize the city of which Augustine wrote. Much later, Frederick II employed highly religious imagery to legitimate his authority. He portrayed himself as a Christlike figure who pronounced law on God's behalf.

The Reformation early in the sixteenth century brought large-scale religious diversity to Europe and effectively ended the hope of a unified Christendom. It thereby posed new questions for political philosophy, questions about how social unity could be maintained in the face of religious diversity, about what the proper ends of politics should be, and about what gives rulers their political legitimacy.

2 Political philosophy in the modern period

One challenge to the claim that human beings naturally form a spiritual unity came with the discovery of the Americas. The native peoples of the Americas had had no previous exposure to Christianity and lived very differently from Europeans. European political thinkers of the sixteenth century therefore asked what the status of the native peoples was and how Europeans were obliged to treat them. Some argued that the native peoples were either animals or natural slaves who could be deprived of their property. Most religious political philosophers, notably the Spaniards Francisco de Vitoria, Luis de Molina (§4) and Domingo de Soto (§4), argued that the native peoples of the Americas were fully human, that they should not be compelled to accept Christianity, that their property rights should be respected and that the *conquistadores* should return what they had taken. These arguments, sadly, had little practical impact.

The last great defender of a unified Christendom was Robert Bellarmine, a cardinal of the Roman Catholic Church and opponent of the Reformation. In his *De summo pontifice*, Bellarmine argued that human beings have a common human nature and common supernatural end, and are thus spiritually united. He concluded that all human beings are subject to a single ultimate spiritual authority, whom he identified as the pope. Because the pope has ultimate authority over spiritual matters, he also has authority over those political matters that affect people's spiritual welfare. Bellarmine concluded that the pope has the power to declare laws invalid that endanger the one true faith and to depose rulers who fall into heresy or who leave the one true Church.

Like Bellarmine, the English philosopher Thomas Hobbes (§7) recognized that religious diversity was a source of political conflict. Religious diversity, Hobbes recognized, carries with it a diversity of religious authorities. Members of political societies who owe their allegiance to different religious authorities can find themselves under obligations which bring them into conflict. Some, for example, may be obliged to worship in ways that others find intolerable. Rulers who follow different religions can think themselves obliged to spread their religion to other nations. Like Bellarmine, Hobbes therefore located the source of religiously based conflict in the potentially conflicting demands of diverse authorities. Where Hobbes and Bellarmine disagreed was on how these problems were to be addressed.

In *Leviathan* (1651), Hobbes denied Bellarmine's claim that all human beings naturally form a spiritual unity which has but one spiritual leader. Instead, he argued, groups of human beings unite themselves by subjecting themselves to a common sovereign. Hobbes thought that the toleration of religious diversity within a state was an invitation to civil war. He also thought that recognizing a spiritual authority (such as the pope) not subject to the national sovereign would breed political division. A sovereign, Hobbes argued, can maintain the unity and peace of the subjects only if the sovereign has absolute authority in both political and spiritual matters. Therefore each national state is to have a Church of its own. The doctrine and practices of a national Church should, in Hobbes'

view, be dictated by a political ruler with the power to punish dissenters.

According to Hobbes' analysis of moral obligation, individuals can have obligations only when there is someone with absolute power to ensure compliance. A contract between two people is morally binding, for example, only if there is someone with absolute power to enforce its terms. It follows that members of one society, with religious and political obligations to its absolute sovereign, cannot have any conflicting obligations to a foreign religious authority such as the Pope. Moreover, no one exercises absolute sovereignty over the world. It follows, therefore, that no national sovereign can have an obligation to spread religion to other nations, since there is no one to compel the sovereign to fulfil that obligation.

John Locke (§7) endorsed a different solution: religious toleration. This is the doctrine that state power should not be used to enforce religious conformity. Locke's defence of this doctrine, as found in his *A Letter Concerning Toleration* (1689), rests upon two arguments. First, Locke argued that religious belief is a mental state into which people cannot be forced. It is therefore irrational to employ coercive force in an attempt to secure religious conformity. Second, Locke held that religious diversity is not itself a source of social and political conflict. What leads to such conflict is religious persecution. Cease persecuting dissent, and religiously based political conflict will largely disappear.

The toleration Locke defended was limited in scope. He was suspicious of Catholics because of their allegiance to the pope. He was also suspicious of atheists who, he thought, lacked sufficient motivation to perform their civic duty because they lacked a belief in eternal punishment. Locke was therefore reluctant to extend religious toleration to members of either of these groups.

Locke said that public officials may prohibit religious conduct if it interferes with valid political purposes, but denied that they may promote or discourage religion as such. His view, as he lays it out in his *Letter*, therefore contains the germ of an important idea: the separation of Church and state. However, Locke did not explicitly develop and defend this view himself. Church-state separation and religious toleration were, however, very important ideas to the founders of the American republic a century later. Some, such as Thomas Jefferson, defended religious freedom because of the importance they attached to individual liberty. James Madison (1785) argued against establishing the Church of the majority. He thought that establishment and the governmental support that came with it conferred too privileged a position on the Church in question, which in turn led to complacency and even corruption among the clergy. Thus disestablishment, Madison concluded, benefited the Church of the majority as well as minority denominations.

Historians of philosophy commonly associate Locke and Jefferson with the movement of thought known as the Enlightenment. Its most prominent philosophers were Locke, Montesquieu, Rousseau and Kant. These Enlightenment liberals reposed great confidence in the power of human reason to understand the natural world and to solve social and ethical problems. This confidence in human reason was central to the political philosophies of Enlightenment philosophers. Political thinkers of the Enlightenment typically argued that political authority is legitimate only if society is organized in ways that each individual could understand and approve, at least under proper circumstances.

The Enlightenment account of legitimacy was not only a reaction to those such as Hobbes who thought that rulers should have absolute power. It was also a reaction against earlier thinkers in the modern period who invoked religion to legitimate political authority. According to the doctrine of the divine right of kings, for example, monarchs were entitled to rule by the grace of God and were responsible only to God for their rule. Divine-right theory was at its height in England in the century prior to the Civil Wars of 1642-51 and in France under Louis XIV.

The insistence that the legitimacy of a political order rests upon the rational consent of individuals who live under it has provoked charges that Enlightenment liberalism is unduly individualistic and rationalistic. Enlightenment liberalism has also been criticized as overly hostile to religion, in part because it purposely excludes religion from its account of the foundations of government. Whether or not the charge of hostility can be sustained, the fact remains that the theological doctrines of Catholic and Protestant Christianity had little impact on the substantive views of Enlightenment political philosophers. These thinkers were, however, concerned with the power of ecclesiastical institutions. They generally advocated religious toleration and favoured restricting the political

influence of the clergy and of institutions such as the Catholic Church.

Among the critics of Enlightenment liberalism was the British thinker and political figure Edmund Burke (§3). Burke is considered a classical conservative. While contemporary conservatives are usually identified by the value they attach to the operation of free markets and to minimalist government, classical conservatives are identified by the value they accord to tradition. Thus Burke argued that emphasis on individual rational consent neglects the importance of tradition in maintaining political unity and in setting social aims. He claimed that social unity and peace depend upon the willing adherence to traditional mores, social arrangements and institutions. These institutions should, in Burke's view, include an established national Church such as the Church of England.

More recently, liberalism has also been criticized by Karl Marx (§3) and his followers. Marxists argue that religion is an ideology. It helps to maintain social stability under conditions of industrial capitalism by obscuring the operations of an economic system that exploits the working classes. It does so by systematically encouraging false social analysis. Its emphasis on individual charity as an ideal human motivation masks the fundamental character of economic forces in human history. More importantly, its other-worldly emphasis distracts members of the working class from their condition and makes them more content with it than they would otherwise be. A fully communist society would abolish exploitation of the working class and vest political power in its hands. In such a society, religion would wither away because the felt need for it would disappear. Twentieth-century countries that have purported to be Marxist - such as China, the former Soviet Union, the former East Germany, and Albania - have discouraged or prohibited organized religion, ostensibly to help realize full communist society.

3 Contemporary political philosophy

The first half of the twentieth century saw a revival of interest in the thought of Thomas Aquinas among Catholic scholars. With this Thomistic revival came a renewed interest in natural law political philosophy (see Natural law; Thomism). Natural law theory has traditionally emphasized the common good as the goal of government. Pursuit of the common good, it is sometimes thought, must come at the expense of individuals whose opinions and ways of life are at odds with it. Natural law theory has therefore been criticized for an inability to accommodate the rights of individuals. This is a criticism that twentieth-century natural law thinkers have tried to meet. Jacques Maritain (§3), for example, argued that natural law theory could lend philosophical support to the UN's Declaration of Human Rights. John Courtney Murray, an American Jesuit, used natural law reasoning to argue that the Catholic Church should accept freedom of conscience (1960). The Catholic Church endorsed Murray's position in 1965 at the Second Vatican Council. John Finnis' *Natural Law and Natural Rights* (1980) is an attempt to ground natural rights in an original, and controversial, account of natural law.

Most contemporary political philosophy in the English-speaking world is descended from the Enlightenment liberalism of Locke and Kant. Contemporary liberalism finds its most sophisticated expression in *A Theory of Justice* (1971) by the American political philosopher John Rawls. Rawls claims that liberal democracies must conform with moral principles that would be acceptable to every individual. This claim raises questions about the circumstances under which hypothetical consent must be registered. Rawls argues that it should be rendered under circumstances of freedom and equality.

Consent to moral principles cannot, Rawls says, depend upon the religious or philosophical beliefs of the consenting parties. Therefore the moral foundations of liberal democracy are, on Rawls' view, independent of religion. He also believes that religion should play only a very restricted role in debates about legislation and public policy. He argues, for example, that using *only* religious considerations to justify sharp legal restrictions on abortion compromises the reasonableness and civility of public debate. Other contemporary liberals, such as Robert Audi, have defended even more severe moral (not legal) restrictions than Rawls endorses. Audi argues that it is wrong to participate in political debate from religious motives, even if the arguments introduced into debate are thoroughly secular (Audi 1989). Such religiously motivated participation, Audi says, compromises reasonableness and civility.

Some religious thinkers (Wolterstorff 1997, for example) have criticized Rawls and other liberals for these restrictions. They argue that religion is so important to its adherents that they should be able to express their convictions in public debate. They also point out that religious themes and stories have a political appeal that transcends denominational lines. Use of religious imagery and argumentation, they maintain, is therefore not as

unreasonable as they think Rawls, Audi and other liberals take it to be.

Religion and science

Philosophical discussion of the relation between modern science and religion has tended to focus on Christianity, because of its dominance in the West. The relations between science and Christianity have been too complex to be described by the 'warfare' model popularized by A.D. White (1896) and J.W. Draper (1874). An adequate account of the past two centuries requires a distinction between conservative and liberal positions. Conservative Christians tend to see theology and science as partially intersecting bodies of knowledge. God is revealed in 'two books': the Bible and nature. Ideally, science and theology ought to present a single, consistent account of reality; but in fact there have been instances where the results of science have (apparently) contradicted Scripture, in particular with regard to the age of the universe and the origin of the human species.

Liberals tend to see science and religion as complementary but non-interacting, as having concerns so different as to make conflict impossible. This approach can be traced to Immanuel Kant, who distinguished sharply between pure reason (science) and practical reason (morality). More recent versions contrast science, which deals with the what and how of the natural world, and religion, which deals with meaning, or contrast science and religion as employing distinct languages. However, since the 1960s a growing number of scholars with liberal theological leanings have taken an interest in science and have denied that the two disciplines can be isolated from one another. Topics within science that offer fruitful points for dialogue with theology include Big-Bang cosmology and its possible implications for the doctrine of creation, the 'fine-tuning' of the cosmological constants and the possible implications of this for design arguments, and evolution and genetics, with their implications for a new understanding of the human individual.

Perhaps of greater import are the indirect relations between science and theology. Newtonian physics fostered an understanding of the natural world as strictly determined by natural laws; this in turn had serious consequences for understanding divine action and human freedom. Twentieth-century developments such as quantum physics and chaos theory call for a revised view of causation. Advances in the philosophy of science in the second half of the twentieth century provide a much more sophisticated account of knowledge than was available earlier, and this has important implications for methods of argument in theology.

1 Religion and Western predecessors of science

Western interest in a systematic account of the natural world is an inheritance from the ancient Greeks rather than from the Hebrew tradition, which tended to focus on the human world. The Greek concept of nature was not set over against a concept of supernature, as it has been in more recent centuries, so it is possible to say that Greek philosophy of nature was inherently theological. Early Christian scholars were divided in their approach to Greek natural philosophy, some making great use of it for apologetic purposes (see Origen §3; Augustine §§1, 4, 8), others rejecting it (see Tertullian).

After the fall of Rome, the centre of scholarship shifted eastward. Islamic scholars in the Middle Ages were largely responsible for preserving the learning of the Greeks, as well as for significant scientific developments of their own in the fields of optics, medicine, astronomy and mathematics. It was through Muslims in Spain that important scientific works by Aristotle were introduced to western Europe in the twelfth century. The influence of these works on Christian thought culminated in Thomas Aquinas' two Summas (see Aquinas, T. §§5-6; Aristotelianism, medieval §§3-4).

2 Early modern science and worldview

At the end of the nineteenth century, White (1896) and Draper (1874) promoted the view of science and religion as traditional enemies. However, revisionist history at the end of the twentieth century presents a much more complex picture. It is true that the Catholic Church silenced Galileo (§§1, 4) in 1633, that René Descartes' mechanicist conception of matter was condemned, and that fear of censorship had a generally chilling effect on scientific theorizing throughout the seventeenth century (see Descartes, R. §11). However, it must be noted that not all of the Catholic officials were opposed to Galileo. In addition, a number of the century's greatest scientists were Catholic: Pierre Gassendi (§1), Marin Mersenne (§§1, 2), Blaise Pascal (§§3, 6) and Nicolas Steno, as well as Galileo and Descartes. The Jesuit order was home to a number of scientists who were not outstanding theorists but contributed

significantly to experimental science.

In the early modern period, it is difficult to distinguish conflicts between science and religion on the one hand from intra-theological conflicts and conflicts between the new science and the Aristotelian scholastic synthesis on the other. The Galileo affair needs to be interpreted in the light of both these complications, since it is not possible to understand the resistance to Galileo's astronomy without recognizing the fact that it called into question an entire socio-political order founded on a picture of the cosmos and of the place of humans in it. The affair was also an internal church struggle concerning the proper interpretation of Scripture. Galileo followed Augustine's rule that an interpretation of Scripture should be revised when it is found to conflict with other knowledge. This put him in conflict with conservative church officials who adopted a more literalist interpretive strategy. A further complication is the fact that the new science was often liberally mixed with magic and astrology, which the Catholic Church condemned both because they dabbled with the demonic and because of suspicion that they confirmed Calvinist views of determinism against the Catholic view of free will.

Robert Merton (1938) argued that Puritanism promoted the scientific revolution, a thesis still debated over half a century later. While Merton's thesis was overstated, it is likely that a particular Reformed doctrine of the sovereignty of God - that God's sovereignty excludes all active contributions of lesser beings to his work - made the modern scientific and philosophical conception of matter as inert or passive more acceptable to Isaac Newton, Robert Boyle (§4) and other Protestants than it would otherwise have been. Here again it is important to recognize the interplay of Aristotelianism and intra-theological disputes. The mechanicist conception of matter was a direct rejection both of Neoplatonic magical conceptions and of the Aristotelian teleological and organicist view, that 'forms' inherent in substances provided built-in powers and goals. At the same time, it furthered theological convictions first expressed by late medieval nominalist theologians (see Nominalism §§1-2). It is one of the great ironies of history, then, that Newton's mechanicist conception of the material universe so quickly evolved into Pierre Simon de Laplace's purely materialist and determinist view, the latter being absolutely incompatible with religion.

3 Indirect relations

If direct conflicts between Christian theology and the various theories of modern science have often been overemphasized, the deleterious effects on theology of indirect conflicts between religion and science have received too little attention. These indirect interactions can be considered under the headings of metaphysics and epistemology.

Metaphysics. Descartes' mechanicist view of matter as pure extension, accompanied by a view of mind as 'thinking substance', inaugurated a metaphysical dualism that has replaced older and more nuanced views of Christian anthropology. In so far as this dualism has been shown to be philosophically untenable, Christianity, with its view of the soul and afterlife, has appeared untenable as well (see Dualism).

The clockwork image of the universe as a closed system of particles in motion, strictly governed by the laws of physics (the image epitomized in the nineteenth century by the work of Laplace), created insuperable problems in accounting for divine action. A popular variety of deism offered the most reasonable account: God was the creator of the universe, and responsible for the laws of nature, but has no ongoing interaction with the natural world or with human history (see Deism §1). The alternatives for theists were accounts of miraculous interventions or an account of God as an immanent sustainer of natural processes (see Miracles §§1-2). The former seemed to make God irrational (contradicting God's own decrees) or inept (needing to readjust the system). The latter view made it difficult to maintain any more sense of God's personal involvement in human life than was possible for the deists. Much of the difference between liberal and conservative Christianity can be traced to theories of divine action: conservatives tend to take an interventionist, liberals an immanentist, view.

Epistemology. Medieval theologians had two sets of epistemological categories at their disposal, those relating to *scientia* (demonstrative or scientific knowledge) and those relating to *opinio* ('probable' beliefs, including those based on authority). So those theological conclusions that could not be deduced from first principles could, happily, be based on unimpeachable authority, the very word of God. However, in the modern period, the range of *scientia* contracted to the spheres of mathematics and formal logic; Hume (§6) and Kant (§8) both provided powerful critiques of deductive arguments for the existence of God and of natural theology generally. Furthermore,

when probable knowledge took on its contemporary sense of knowledge based on the weight of empirical evidence, appeals to authority became irrelevant, and most judged it impossible to provide empirical evidence for theological claims. Thus the central question for modern liberal theologians has been how, if at all, theology is possible.

Liberal theology diverged from more traditional accounts as a result of its strategies for meeting the problems raised directly or indirectly by science. Following Friedrich Schleiermacher (§7), many liberal theologians have understood religion to constitute its own sphere of experience, unrelated to that of scientific knowledge. Theological doctrines are expressions of religious awareness, not accounts of a supernatural realm. God works immanently, not by interventions in either the natural world or human history. Thus liberal theology has avoided direct conflict with modern science, at the cost (or with the beneficial consequence) of a radical revision of the very concepts of religion and theology. However, Ian Barbour's *Issues in Science and Religion* (1966) presented an encyclopedic overview of the points at which scientific claims *are* relevant to religious thought, and in *Myths, Models, and Paradigms* (1974) he argued for significant epistemological similarities between science and religion. Since then, a growing number of scholars from the liberal wing of Christianity have begun to call the modern division of territory into question.

4 Geology, evolution and the age of the earth

Physics and astronomy were the main scientific foci for theologians in the seventeenth and eighteenth centuries; geology and biology held an analogous place in the nineteenth and twentieth. For centuries, the biblical narrative from creation to Christ and the projected Last Judgment provided the skeletal outline for accounts of natural as well as human history. For instance, the story of Noah and the Flood served as a useful explanation for marine fossils found high above sea level. However, by the seventeenth century, the short span of history calculated from the Bible was being challenged from a number of directions. (James Ussher, a seventeenth-century Irish archbishop, has been credited with the calculation that creation took place a mere 4004 years before Christ.) Although sporadic attempts to reconcile geological history with Genesis continue up to the present, in the eighteenth century a large number of geologists already recognized that the Flood hypothesis could not explain the growing body of knowledge regarding rock stratification and the placement of fossils. A much longer history of the Earth, prior to human history, had to be presumed. At the same time, Egyptian and Chinese records were calling into question the short span of human history calculated from the Bible.

While some contemporary opposition to evolutionary theory involved 'young earth' chronology, negative reactions in the nineteenth century to Charles Darwin's *The Origin of Species* (1859) were more often objections to social Darwinism and to the claim that humans were kin to the 'lower animals'; other negative reactions focused on the fact that natural selection provided an alternative to divine design for explaining the fit of organisms to their environments, thus undermining an important apologetic argument. Nonetheless, many theologians and other believers readily accepted the theory and judged the changes it required in theology to be salutary rather than mere accommodation (see Darwin, C. §§2-4; Evolution, theory of).

5 Biological sciences

The theory of evolution is a surprisingly hot issue again at the end of the twentieth century. A Gallup poll published in the magazine *US News and World Report* (December 23, 1991) reported that a majority of North American Christians are sceptical of the macroevolutionary paradigm. The best explanation for this resistance is probably the fact that the issue has come to be framed in terms of creation *versus* chance as an account of the origin of the human species. That the issues can be formulated in these terms is due in part to a (defective) theory of divine action that contrasts God's creative acts with natural processes, rather than allowing that God may work through natural processes, including those that involve random events. The controversy is exacerbated by the use made of evolutionary biology by proselytizing atheists.

Genetics provides a new area for dialogue between religion and the biological sciences. Studies showing a genetic basis for human characteristics and behaviour raise questions about the status of the human person - for example, questions about free will and determinism - that have been the province of philosophy and religion. Of particular interest are studies of twins suggesting a genetic factor in religious behaviour (for example, Eaves *et al*. 1990).

Genetic research in general and genetic engineering in particular have raised a number of ethical questions that relate to theological ethics. For example, while most people favour genetic treatment for illnesses, many are opposed to germ-line intervention, which would affect all succeeding generations. Some objections are based on quasi-religious positions: scientists should not ‘play God’. This line of thinking calls for theological scrutiny: are not human beings themselves created in order to participate in God’s ongoing creative process? It is noteworthy that in 1991, the US National Institutes of Health awarded its first grant ever to a theological institution to the Center for Theology and the Natural Sciences (Berkeley, California) to study the theological and ethical implications of the Human Genome Initiative, the project to map human DNA (see Genetics and ethics; Religion and morality §4).

6 Cosmology

Physical cosmology is the branch of science that studies the universe as a whole. Beginning in the 1920s, developments in this field have sparked lively debate at the interface between theology and science. The Big-Bang theory, based on the expansion of the universe and a variety of other data, postulates that the universe originated in an extremely dense, extremely hot ‘singularity’ some 15 to 20 billion years ago (see Cosmology §3). Many Christians, including Pope Pius XII, greeted this theory as a confirmation of the biblical doctrine of creation. It was not only religious people who saw it as such; Frederick Hoyle defended a steady-state model of the universe, in which hydrogen atoms come into being throughout an infinite time span, partly because he saw it as more compatible with his atheism.

The discussion among theologians on the relevance of Big-Bang cosmology to the doctrine of creation involves controversy over the very nature of theology. As mentioned above, it has been common among liberal theologians since Schleiermacher to claim that religious meaning is entirely independent of scientific fact. Theologians who hold this position claim that the doctrine of creation, having to do only with the relation of all that exists to God, says nothing about the temporal origin of the universe, and is therefore equally compatible with any cosmological model.

A more recent area of research that has occasioned theological speculation can be referred to as the issue of the anthropic principle. A number of factors in the early universe had to be adjusted in a remarkably precise way to produce the universe we have. These factors include the mass of the universe, the strengths of the four basic forces (electromagnetism, gravitation, and the strong and weak nuclear forces), and others. Calculations show that if any of these numbers had deviated even slightly from its actual value, the universe would have evolved in a radically different manner, making life as we know it - and probably life of any sort - impossible. An example of the ‘fine-tuning’ required is that if the ratio of the strength of electromagnetism to gravity had varied by as much as one part in 10^{40}, there would be no stars like our sun.

Many claim that this apparent fine-tuning of the universe for life calls for explanation. To some, it appears to provide grounds for a new design argument (see God, arguments for the existence of §5). Others believe that it can be explained in scientific terms - for example, by suggesting that there are vastly many universes, either contemporaneous with our own or in succession, each of which instantiates a different set of fundamental constants. One or more of these universes would be expected to support life, and it is only in such a universe that observers would be present to raise the question of fine-tuning. Whether or not the fine-tuning is taken as evidence for the existence of God, it has important consequences for theology in that some philosophers believe that it argues against an interventionist account of continuing creation and divine action, since the prerequisites for human existence were built into the universe from the very beginning.

7 Physics and metaphysics

A variety of developments in physics since the end of the nineteenth century have called into question the determinist worldview. Quantum physics has introduced indeterminacy into the worldview of physics. Quantum theory generally allows only for probabilistic predictions regarding classes of events, not for prediction of individual events. It is unclear whether this limitation represents only a limit of human knowledge, or whether it signifies genuine indeterminacy in nature (see Quantum mechanics, interpretation of §3). However, scholarly opinion tends towards the latter view. Thus, most physicists reject the determinism of the Newtonian worldview, at least at this level. ‘Quantum non-locality’ refers to the peculiar fact that electrons and other sub-atomic entities that

have once interacted continue to behave in coordinated ways, even when they are too far apart for any known causal interaction in the time available. This phenomenon calls radically into question the Newtonian picture of the universe as discrete particles in motion, interacting by means of familiar physical forces. If Newtonian determinism had strong implications for theories of divine action, it is surely the case that these developments in quantum physics must have theological implications as well. What these implications are is still very much an open question.

A more recent development, which cuts across physics and the other natural sciences, is chaos theory (see Chaos theory). This is the study of systems whose behaviour is highly sensitive to changes in initial conditions. What this means can be illustrated with an example from classical dynamics: the movements of a billiard ball are governed in a straightforward way by Newton’s laws, but very slight differences in the angle of impact of the cue stick have greatly magnified effects after several collisions; moreover, initial differences that make for large differences in later behaviour are too small to measure, so the system is intrinsically unpredictable. Chaotic systems are found throughout nature - in thermodynamic systems far from equilibrium, in weather patterns and even in animal populations. Chaos theory is relevant to discussions of divine action not because chaotic systems are indeterminate (that is, not causally determined) and thus open to divine action without violation of laws of nature. Rather, the recognition of the ubiquity of chaotic systems shows the intrinsic limitations of human knowledge, and leads to the negative but important conclusion that one is rarely (or never) in a position to know that God is not acting in natural processes.

Another development throughout science with important implications for the issue of determinism and divine action is the recognition of ‘top-down causation’. The sciences can be conceived as a hierarchy in which higher sciences study progressively more complex systems: physics studies the smallest, simplest components of the universe; chemistry studies complex organizations of physical particles (atoms and molecules); biochemistry studies the extremely complex chemical compounds making up living organisms, and so on. The dream of the logical positivists was to provide an account of the sciences wherein the laws of the higher-level sciences could all be reduced to the laws of physics (see Logical positivism). This concept of explanatory reductionism followed naturally from the ontological reductionism that has become an important tenet of the modern scientific worldview: if all entities and systems are ultimately made up of the entities studied by physics, their behaviour ought to be understandable in terms of the laws of physics. So ontological and explanatory reductionism entail causal reductionism, or ‘bottom-up causation’. If the laws of physics are deterministic, we have a deterministic account of the whole of nature. However, it has become apparent that the behaviour of entities at various levels of the hierarchy of complexity cannot always be understood entirely in terms of the behaviour of their parts; attention to their interaction with non-reducible features of their environments is also required. Thus, the state or behaviour of a higher-level system exercises top-down causal influence on its components.

Arthur Peacocke (1990) has used this development in scientific thought to propose new directions for understanding divine action. In his ‘panentheist’ view, the universe is ‘in’ God, and God’s influence on the cosmos can then be understood by analogy with top-down causation throughout the hierarchy of natural levels (see God, concepts of §8). While this proposal does not answer questions about how God affects specific events within the cosmos, it does dissolve the long-standing problem of causal determinism.

8 Epistemology and language

The shift from medieval epistemology to modern empiricism required radical revision of religious epistemology. Various strategies were employed during the modern period to show theology to be epistemologically respectable. However, the increasing prevalence of atheism in scholarly circles suggests that these strategies have not been successful. At a point in intellectual history that some would call the end of the modern period, theories of knowledge have changed enough that the question of the epistemic status of theology needs to be examined afresh. Our concern here will be only with changes relating directly to science.

Theologians’ statements have sometimes been dismissed on the grounds that they describe states of affairs that are unimaginable or non-picturable. However, quantum theory and other recent scientific developments describe a physical reality that is equally unimaginable and, some would say, calls into question traditional two-valued logic. This line of argument is intended to point out that a view of knowledge more humble than that of the modern period is called for; reality is more complex and mysterious than anything our language and concepts allow us to

capture.

It has often been said (especially by theologians) that theology differs radically from science in that science is objective while all religious knowledge is self-involving, the product of an interaction between God and the human subject. Another way in which science has tempered older views of knowledge, and narrowed the difference between science and theology, is in its recognition that scientific knowledge itself is interactive. Measurements are interactions with the phenomena being measured, especially at the subatomic level.

Most modern thinkers have judged it impossible to provide empirical support for theology. However, beginning with the work of Ian Barbour (1974), there has been an investigation of the ways in which theological reasoning resembles that of science, including accounts of suitable data for theology. This development was made possible by advances in philosophy of science that show science itself to be a more complicated, and more human, enterprise than the positivists assumed (see Kuhn, T.; Lakatos, I. §3).

9 Religion's implications for science

Most of this entry has focused on the implications of science for religion. However, it is also the case that religion has implications for science. It has been argued that Christian doctrine was an important contributor to the rise of modern science: God's freedom entailed that features of the natural world could not be deduced a priori from rational principles, yet God's goodness and faithfulness suggested that the world would not be so chaotic as to be unintelligible. The very existence of religion is a valuable reminder that there are boundaries beyond which scientific explanation cannot go, and its doctrines help to answer questions that lie beyond those boundaries. The Newtonian era saw the separation of natural philosophy (science) from natural theology, and since then it has been a methodological presupposition of science that it should provide purely natural explanations. Science has thereby set boundaries on its own competence, but this does not mean that what is beyond its competence is therefore unimportant (or non-existent). Cosmology and physics raise questions they cannot answer: Why is the behaviour of natural processes law-like? What caused the Big Bang? Why is there a universe at all? While theology and science may interact in minor ways within each of their proper domains, it is here that theological explanation comes into its own.

Religion, critique of

During the Enlightenment a new philosophy of religion arose, one which was not connected with metaphysics or philosophical theology. It asked to what extent religion could be legitimated philosophically, to what extent it could be shown to be reasonable.

*The reasonableness of religion was taken to be significant for the political as well as the confessional clash between Christian denominations in Europe, all of which tried to justify their conflicting religious doctrines by reference to a supernatural revelation. The philosophical debate that began in the Enlightenment with regard to the criteria and arguments for a religion connected either to human nature or to public reason can be called a 'critique of religion' (*Religionskritik*), although the expression is not common before the critical philosophy of Kant and his school. Hegel followed the programme of Kant's philosophy, maintaining a philosophical concept of religion as falling 'within the limits of reason alone'. The radical left-wing school of Hegelianism transformed Hegel's approach, which was a critical legitimation of religion, into its destruction. Presupposing materialism in ontology and atheism, Feuerbach held that religion should be interpreted as a kind of anthropology. Marx claimed that religion is an expression of a certain sort of ideology and a necessary illusion within a class-structured society.*

In twentieth-century philosophy, the critique of religion can be found in two positions. The first is a rational reconstruction of the practical intentions or semantic content of religious belief; the second is a continuation of the interpretation of religion as ideological or illusory. In addition, we can identify certain other varieties of the critique of religion, including the theological critique of religion (found, for example, in the work of Barth and Bonhoeffer) and the philosophical critique of particular religious traditions (found, for example, in the romantic and postmodern rejections of Christian monotheism by Hölderlin, Nietzsche, Klages and Heidegger).

1 The concept of the critique of religion

In the history of Western philosophy, the specific contents of mythologies and religions as well as the forms of religious representations and practices have always been the subject of philosophical reflection. But only at the time of the European Enlightenment do we find the term 'critique of religion' (*Religionskritik*). This may indicate that the philosophy of the seventeenth and eighteenth centuries discovered the problem of a general philosophical theory of religion as such beyond the earlier metaphysical theories of a first cause or highest good. The immediate cause of the Enlightenment reflection was concern regarding the conflicting claims of reason and faith, of rational human insight and of divine revelation. While Pierre Bayle maintained the fundamental incompatibility of reason and religion, the rationalist Leibniz (§3) claimed a conformity of faith with reason. But in so far as the religious confessions had to refer to historical events or traditions, Leibniz's belief in such a conformity lost its plausibility. The search for a natural religion as a common property of all human beings sought to overcome the uncertainties of the particular confessions, their conflicting claims and their recourse to revelation. Belief in a 'natural religion' by thinkers such as Reimarus, Lessing and Wolff (§6) was clearly a criticism of the unrestrained claims of the historical religions based on revelation. None the less, it was the philosophy of Kant that first introduced the concept of a critique of religion into the philosophical debate. His special critique of religious belief is part of the general critical task he defined as essential for philosophy. In the preface to the first edition of his *Critique of Pure Reason*, Kant describes the duty of philosophy as 'a call to reason to undertake anew the most difficult of all its tasks, namely that of self-knowledge, and to institute a tribunal which will assure to reason its lawful claims, and dismiss all groundless pretensions' (1781: A11).

According to that account of the task of philosophy, all historical forms of religion have to be examined in the light of a general and public reason. Kant presupposes a concept of reason which is able to develop the criteriology to judge by its own competence. This critical approach is clearly distinct from the earlier positions. In defining the essence of religion as the recognition of the duties of human beings discovered by pure practical reason 'as divine commands', Kant is able to escape from the conceptual choice offered by deism, between a natural religion and a historical and revealed one. For Kant, it is not the origin of a religion but its 'qualification to be universal' which defines religious legitimacy. As he explains in *Religion within the Limits of Reason Alone*:

> Such a religion can be natural, and at the same time revealed, when it is so constituted that men could and

ought to have discovered it of themselves merely through the use of their reason, although they would not have come upon it so nearly, or over so wide an area, as is required.

(1793/1794: A219/B233)

2 Critique of religion after Hegel

In Hegel's idealistic philosophical system, religion and philosophy have the same subject, namely God or the Absolute Idea. One difference between religion and philosophy has to do with how each is able to express or to comprehend that subject. While Hegel defines religion as a system of symbolization or a 'form of imagination', it lacks a specific stage of conceptual reflection and self-awareness. It is the task of philosophy to reflect the imaginative form of the religious representation of the Absolute and, in doing so, to overcome its limits. Therefore, Hegel concludes that philosophy can claim the higher insight (see Hegel, G.W.F. §8).

This idealistic critique of religion was the immediate cause for a series of severe controversies after Hegel's death (1831). Karl Marx's famous opening statement in his *Critique of Hegel's Philosophy of Law* (1844), that 'the critique of religion is the precondition for all further criticism', has to be seen as a reaction to Hegel's idealistic view of religion's function and limits and the identical content of philosophy and religion (see Marx, K. §§2-3). On the other hand, Kierkegaard's existentialist protest against Hegel must be understood as criticism of the devaluation of religion and its interpretation within the idealistic system of philosophy (see Kierkegaard, S.A. §2). Feuerbach's theory of the anthropological content of religion and his critique of religion as an illusory projection of human attributes onto God participates in the general rejection of Hegel's philosophy by the critical movement of the 'Hegelian left' (see Feuerbach, L.A.). One of the consequences of this programme to reduce the idealistic philosophy to its true - that is, social-historical - origin and its practical human content is found in Marx's work. Religion for Marx is no longer the symbolic expression of the Absolute Idea, but the 'sigh' of the oppressed creature, a necessary illusion in a class society and a protest against injustice and exploitation.

3 Critique of religion in the twentieth century

The philosophical critique of religion in the twentieth century reflects the broader interest and engagement of philosophers in the field of philosophy of religion. In addition to a continuation of a rational critique of religion in the tradition of the Enlightenment, Kant and Hegel (examples are the Neo-Kantian philosophers Paul Natorp, W. Windelband, Hermann Cohen (§3) and Ernst Cassirer, and the philosophers of religion Paul Tillich and R. Schaeffler), and a tradition of a more or less Marxist critique (examples are R. Garaudy and Ernst Bloch), we can identify various new types of philosophy of religion. These often include new categories of a critique of religion, with both affirmative and disapproving statements of religion. In the tradition of psychoanalysis, there are the works of Freud and Mitscherlich. In the context of historicism we find Ernst Troeltsch. In the philosophical school of phenomenology there are Rudolf Otto and Max Scheler, and in the analytical tradition there are Russell, Carnap, Wittgenstein, Ayer and Hare. In addition to these, we can recognize two further contributions to the critique of religion, especially in Germany. First, there is the dialectical theology of Karl Barth, in which religion is supposed to be a work of human beings which is opposed to the 'word of God', and the position of Dietrich Bonhoeffer, who favours a Christian belief without religious qualities (*religionsloses Christentum*); second, there is the (neo-)romantic proposal to resuscitate elements of ancient Greek mythology and a polytheistic view of the world in the tradition of Hölderlin, Nietzsche, Klages and Heidegger.

Religion, history of philosophy of

The philosophy of religion comprises any philosophical discussion of questions arising from religion. This has primarily consisted in the clarification and critical evaluation of fundamental beliefs and concepts from one or another religious tradition. Major issues of concern in the philosophy of religion include arguments for and against the existence of God, problems about the attributes of God, the problem of evil, and the epistemology of religious belief.

Of arguments for the existence of God, the most prominent ones can be assigned to four types. First, cosmological arguments, which go back to Plato and Aristotle, explain the existence of the universe by reference to a being on whom all else depends for its existence. Second, teleological arguments seek to explain adaptation in the world, for example, the way organisms have structures adapted to their needs, by positing an intelligent designer of the world. Third, ontological arguments, first introduced by Anselm, focus on the concept of a perfect being and argue that it is incoherent to deny that such a being exists. Finally, moral arguments maintain that objective moral statuses, distinctions or principles presuppose a divine being as the locus of their objectivity.

Discussions of the attributes of God have focused on omniscience and omnipotence. These raise various problems, for example, whether complete divine foreknowledge of human actions is compatible with human free will. Moreover, these attributes, together with God's perfect goodness give rise to the problem of evil. If God is all-powerful, all-knowing and perfectly good, how can there be wickedness, suffering and other undesirable states of affairs in the world? This problem has been repeatedly discussed from ancient times to the present.

The epistemology of religious belief has to do with the questions of what is the proper approach to the assessment of religious belief (for rationality, justification, or whatever) and with the carrying out of such assessments. Much of the discussion has turned on the contrast between the roles of human reason and God's revelation to us. A variety of views have been held on this. Many, such as Aquinas, have tried to forge a synthesis of the two; Kant and his followers have sought to ground religion solely on reason; others, most notably Kierkegaard, have held that the subjecting of religious belief to rational scrutiny is subversive of true religious faith. Recently, a group of 'Reformed epistemologists' (so-called because of the heavy influence of the Reformed theology of Calvin and his followers on their thinking) has attacked 'evidentialism' and has argued that religious beliefs can be rationally justified even if one has no reasons or evidence for them.

1 What is philosophy of religion?

The term 'philosophy of religion' is a relative newcomer, dating only from the late eighteenth century. It became widespread under the influence of Hegel, whose system of philosophy featured various 'philosophy of' components - history, mind, art, as well as religion. But philosophical reflection on religious issues is as old as philosophy itself. One of the earliest spurs to philosophy in ancient Greece was the emergence of doubts concerning the religious tradition. The present article construes 'philosophy of religion' as the philosophical discussion of questions growing out of religion, whether conducted under that title or not.

These discussions are highly diverse. Different religions give rise to different issues, depending, for example, on whether the religion is centred around faith in a personal deity. The philosophizing that is done will reflect the thinker's conception of the philosophical task. The philosophy of religion of a speculative metaphysician such as Hegel will differ widely from that produced by an analytic philosopher who thinks of philosophy as concerned primarily with the clarification of concepts. And even when these two variables are assigned specific values, there are different views as to how philosophy can best contribute to the understanding of religion. The main concern has been the clarification and critical evaluation of fundamental beliefs and concepts from some particular religious tradition. But some philosophers in the last two centuries, influenced by Hegel and by phenomenology, have set out to produce a synoptic view of religion in all its aspects, not only the doctrinal and conceptual ones, and to survey and interrelate the different forms in which it is realized (see van der Leeuw 1963).

Faced with this bewildering diversity and long history, an article of this length can provide only a brief sample. It will therefore concentrate on the attempts of Western philosophy to deal with philosophical questions arising from the Judaeo-Christian tradition, and, among these attempts, on what can more specifically be called *philosophical*

theology. This involves the attempt to deal with fundamental religious concepts and beliefs in a philosophical way, where ‘philosophical’ implies two restrictions. First, when our aim is philosophical, we are concerned with *understanding* (clarifying, explicating) the material, and critically evaluating it for truth, coherence and rationality, rather than with *describing* it or discovering laws that govern it. (This distinguishes philosophy of religion from the history, sociology or psychology of religion.) Second, the enterprise is not conducted from the standpoint of any religious commitments. It appeals only to what is (claimed to be) available to any rational person who reflects carefully on the matter. (This distinguishes philosophical theology from dogmatic theology.)

Even with this restriction there is an enormous choice of topics on which to concentrate. Here is a list of those that most frequently appear in current treatises and textbooks on the subject:

(1) arguments for and against the existence of God;
(2) problems concerning the various attributes of God;
(3) the problem of evil;
(4) religious issues concerning human nature, particularly the possibility of human life after death, and free will;
(5) the bearing of religion on ethics;
(6) how to understand basic religious concepts, such as faith, salvation, creation and spirituality;
(7) questions about divine action, particularly the notion that God ‘intervenes’ in the world, bringing about events that would not have occurred had only purely natural causes been involved (miracles);
(8) the epistemology of religious belief.

The present entry deals with the most significant elements in the histories of topics (1), (2), (3) and (8); this choice is prompted by the main areas of interest among contemporary philosophers of religion.

2 Arguments for the existence of God: the cosmological argument

Philosophical theology goes back to the ancient Greeks, to a time at which intellectual dissatisfaction with the polytheistic religious tradition led to attempts by philosophers to develop a more rational religious orientation. Plato, in the *Laws*, may be said to have inaugurated the project of giving philosophical arguments for the existence of God. Interestingly enough, it occurs in a political context. Arguing that the denial of certain theological truths is a grave offence against the social order, he proceeds to demonstrate those truths, beginning with the existence of God. He presents a form of the cosmological argument that turns on the cause of motion. Briefly put, the argument is that motion produced by something else presupposes a self-mover, a being that spontaneously moves. This is identified by Plato with soul (*psychē*). He does not seek to show that all change can be traced to a single self-changing source. On the contrary, he holds that there must be at least two, though he takes the ‘best soul’ to be supreme.

A more elaborate argument from motion is found in Book XII of Aristotle’s *Metaphysics* (see Aristotle §16). Time is necessarily everlasting, for if it came into being, that would presuppose a time before which there was time; and if it were to cease there would be a time after that, a time with no time. Aristotle also thinks that there cannot be time without motion. Therefore motion is everlasting. And since motion presupposes substances that move, it is necessary that there are always substances in motion. But if all substances were destructible (had a potentiality for nonexistence), it would be possible that at some time there were no substances. Hence there must exist at least one substance that is pure actuality, with no unrealized potentialities, and it is this that guarantees the eternality of moving substances. Since it is pure actuality, it does not move, and since all matter involves potentiality it is immaterial. As the source of all motion, it is the ‘first mover unmoved’. Since the first mover is immune to any kind of change, it can be the source of motion only as what Aristotle calls a ‘final cause’, the end or goal towards which a process tends. It moves the heavens (which in turn move all else) as an object of desire or love. As unmoved, it does not enter into causal interaction with the world, as the Judaeo-Christian God does, but confines itself to pure thought. It is ‘thought thinking itself’.

Neither Plato nor Aristotle thought of God as creating the physical universe, but Plato’s God is somewhat more active than Aristotle’s. In the *Timaeus*, Plato depicts God as a ‘Demiurge’ who introduces order into the chaos with which he is initially confronted. But it was left to Christian theology to develop the radical idea of the divine creation of everything other than God *ex nihilo*, from nothing.

Neoplatonism, as developed most fully by Plotinus in the *Enneads*, involved a more mystical view, in which the supreme reality is an absolute One, devoid of any distinctions whatever, and accessible only to a unitive mystical experience in which even the distinction between subject and object is obliterated. Neoplatonism profoundly influenced Christian theology, primarily through the thinker who wrote mystical treatises around AD 500 under the name of 'Dionysius' (see Pseudo-Dionysius). His influence is evident even in thinkers who were not primarily mystical theologians, including Anselm and Aquinas, both of whom held the doctrine of the absolute simplicity of God.

Neoplatonism was the main philosophical basis of Christian theology from Augustine to the twelfth century, when Aristotle's works were rediscovered in western Europe. By the latter half of the thirteenth century the philosophical thought of the West was thoroughly Aristotelian. As for arguments for the existence of God, the 'five ways' of Thomas Aquinas, in his *Summa theologiae* Ia, q.2, came to dominate Roman Catholic philosophical theology up to our own day. Three of the five ways can be viewed as cosmological. There is an argument, reminiscent of Aristotle, to a first mover unmoved, a parallel argument to a first cause (of existence) uncaused, and an argument, again reminiscent of Aristotle, that is designed to show that the universe cannot consist merely of contingent beings (beings that may or may not exist), but must contain a necessary being, one that exists by the necessity of its own nature. But though these arguments are heavily, and admittedly, indebted to Aristotle, Aquinas draws from them conclusions much more congenial to Christian theology. Like Aristotle, he argues that the first cause uncaused must be pure actuality, since it is prior to all other beings and actuality is prior to potentiality. But he also maintains that the first cause must contain all the perfections of those things that depend on it for their existence, since causality consists in actualizing potentialities, and an agent can bestow only those actualities it already possesses. That is the thin end of the wedge Aquinas needs to show that the first cause is absolutely perfect, and from that he proceeds to derive the basic attributes of the Christian God - omniscience, omnipotence, perfect goodness, love, and so on.

Aquinas' first mover and first cause arguments involve the thesis that an infinite series of causes or movers is impossible; hence any such series must stem from a first member, on which all succeeding members depend for their efficacy. It is natural to read Aquinas as denying that a *temporally* infinite series of causes is possible, in which case his conclusion would be that there is a temporally first cause of the universe, and hence that the universe came into existence some finite period of time ago. But since he elsewhere denies that it can be shown by reason that the world had a beginning, this cannot be his intention. His claim is rather that there cannot be an infinite hierarchy of levels of dependence. Such a series would begin, for example, with the motion of a pencil being dependent on the simultaneous motion of my hand, which in turn is dependent on my will, which in turn…. However, Aquinas' development of this way of thinking was in terms of medieval physics, which is far removed from anything taken seriously today. Hence there have been repeated attempts in the modern period to free the argument from entanglement with outmoded science. A notable example is Samuel Clarke (§1) (1738). A brilliant contemporary critical discussion of this argument is put forward by Rowe (1975). Avoiding the sometimes labyrinthine details of Clarke's presentation, the basic idea can be presented as follows:

(1) The physical universe is temporally either finite or infinite.
(2) If finite, the beginning of its existence must have been due to some cause.
(3) If infinite, there must be some cause, the activity of which is responsible for the fact that this universe exists rather than some other or none at all.
(4) Even if the cause of the existence of our universe owes its existence to some other cause, an infinite regress of such causes is impossible.
(5) Therefore, the entire system ultimately owes its existence to an uncaused first cause, one that exists by the necessity of its own nature (a necessary being).

In this version, the series of causes that is claimed to be necessarily non-infinite is wholly outside the spatiotemporal universe. And since the argument begins with the universe as a whole, it does not depend on any particular scientific view of the internal economy of that universe.

In this version, the argument's dependence on what has come to be called the Principle of Sufficient Reason is apparent. According to that principle, for any fact (state of affairs) there must be a sufficient reason for its obtaining, a reason either in itself or in some external cause. Much discussion of the argument has centred around

that principle, which received a historically important defence by Leibniz (§§3, 11).

3 Arguments for the existence of God: the teleological argument

Here the crucial claim is that a cosmic designer is required to explain the design or adaptation we find in the world, the way in which things are fitted to achieve certain ends. Aquinas' fifth way is an early example. He thought in terms of a teleological physics in which all physical processes were explained by an orientation to goal states. For example, each type of matter was thought of as seeking its proper place in the universe - solids the centre (identified with the centre of the earth), fire the periphery, and so on. He then argued that such goal direction is possible for inanimate beings only if they are directed to these goals by an intelligent being. But with the demise of teleological physics in the modern period the main examples of design are found in the organic realm, in the ways in which the structure and function of organisms are nicely adapted to the satisfaction of their needs. For example, the outer ears that land animals, but not fish, possess are fitted to focus sound waves that are weaker in air than in water. And the ears of predators are fitted to receive sounds from in front, while their intended victims have ears that pick up sounds better from the rear. A famous example of this argument is found in Paley's *Natural Theology* (1802), in which he imagines coming across a watch on the ground and becoming convinced, from the way in which its design is conducive to keeping the time, that it was produced by an intelligent designer. He then argues that we must say the same of the human eye (see Paley, W. §2).

The argument was subjected to a variety of criticisms in the *Dialogues Concerning Natural Religion* (1779) of David Hume (§6), many of which involve doubts that the universe as a whole is enough like a watch or other artefact to sustain the argument. In the last century and a half, the chief criticism of the argument has been that the theory of evolution provides a superior, naturalistic explanation for the cases of organic adaptation on which the argument is based. Organisms are well adapted to survive in the environments in which they find themselves because otherwise they would die out. It is the fittest that survive in the competition for scarce resources. In the face of such criticism, the argument has shifted in a way analogous to the shift noted above in the cosmological argument. Instead of starting with particular cases of adaptation, for which scientific explanations might be advanced, we start with the universe as a whole and ask why it is so constituted as to be fitted for life, however particular forms of life are to be explained in terms of factors within the universe. To that question no science could possibly provide an answer, since science is concerned with the internal economy of the universe, how one part or aspect is related to another. With recent developments in the study of the origin and development of the physical universe, this more cosmic form of the argument has received a shot in the arm from considerations concerning the 'fine tuning' that is required of basic physical constants if the universe is to be supportive of life (see Leslie 1989) (see Religion and science §6). The argument has also been extended to include a larger variety of features said to require a designer, such as mathematical order and beauty (see Tennant 1930).

4 Arguments for the existence of God: the ontological argument

This is the final member of the classic trio of arguments. It was first stated clearly by Anselm of Canterbury (§4), the most important thinker of the eleventh century, in his *Proslogion* (1077-8). It differs from the other two in not seeking an explanation of empirical facts. It is purely a priori, consisting in the analysis of concepts. In Anselm's version, it is a *reductio ad absurdum*. Suppose, he says, that the being than which no greater can be conceived ('the perfect being', for short) exists only in the mind and not in reality. Then we could conceive a greater being, one just like the former except that it also exists in reality. But it is impossible that we should conceive a being greater than a being than which none greater can be conceived. Hence the supposition with which we began - that the perfect being does not exist in reality - must be rejected.

A monk named Gaunilo sent Anselm a criticism of the argument, in which one of the points he made was that there must be something wrong with it, since one could use an exactly parallel argument to show that a perfect island, or a perfect anything else, exists. Aquinas rejected the argument on the grounds that it wrongly assumes that we know the essence of God. However, the most persistent criticism, classically expressed by Immanuel Kant in his *Critique of Pure Reason* (1781), is that the argument falsely assumes that existence is a property, whereas we do not add anything to our concept of a being (to the list of its properties) when we point out that it exists.

The argument has had a number of supporters through the centuries, including Descartes (§6) and Leibniz (§3), as well as a number of critics. Leibniz realized that questions could be raised about the *possibility* of a perfect being,

and he undertook to establish that. A major step forward occurred in this century when Charles Hartshorne (1962) and Norman Malcolm (1963) independently discovered that there are two versions of the argument in the *Proslogion*. The first, the one presented above, is designed to show that a perfect being exists, the second that a perfect being necessarily exists. Both Hartshorne and Malcolm point out that the second version is immune to the charge of treating existence as a predicate. There are not the same objections to treating necessary existence as a predicate. More recently, Alvin Plantinga (1974) has made use of contemporary modal logic to develop the most sophisticated formulation of the second form of the argument.

5 Arguments for the existence of God: the moral argument

This argument takes its start from premises concerning moral obligation, moral principles, moral goodness, and the like. It is a more recent arrival than the three just discussed. It was first given prominence by Kant (§11) in his *Critique of Practical Reason* (1788), where we find the following argument: Moral endeavour presupposes that the virtuous will eventually attain happiness, for only in the union of virtue and happiness do we have the supreme good, and it is a fundamental moral obligation to strive to realize the good. But this can be an obligation only if it is possible to attain the supreme good. And this is possible only if the universe is under the control of a morally good personal being. Therefore the existence of God is a necessary presupposition of morality. Kant did not claim that this reasoning enables us to *know* that God exists; it only shows the existence of God to be a presupposition of the moral life.

Other thinkers in the nineteenth and twentieth centuries have presented more straightforward moral arguments. The most common form starts from the claim that moral distinctions - between right and wrong, between what we are and are not obliged to do - are objective. It is an objective fact that it is wrong wantonly to inflict suffering on another human being, and that one is obliged to care for one's children. But this can be so only if there is a God to 'anchor' these facts. According to the argument, there is no other possible objective locus for morality. In some versions it is the divine will - what God commands us to do and not to do - that renders moral facts objective. In others it is the goodness of God that plays this role. God *is* the good, and human morality constitutes the approximation to the divine goodness that is most appropriate for human beings (see Adams 1987).

There have been some interesting recent reformulations of traditional arguments for the existence of God. Chief among them is the restatement of cosmological and teleological arguments in terms of probability and confirmation theory by Swinburne (1979).

6 Divine attributes

As Christian theology developed, the nature of God was thought of in terms of various attributes, such as omnipotence, omniscience and perfect goodness. He was also thought of as a personal agent, one who has purposes and who acts to carry them out in the light of his knowledge. The attempt to think all this through gives rise to various difficulties with which philosophical theologians have been concerned since the early centuries of our era.

Omnipotence. It is not difficult to see that this attribute must be limited in some way if we are to avoid paradoxes and contradictions. For one thing, we have to avoid the idea that God could bring about contradictory states of affairs. If he could, then he could both save Jones and damn Jones, an inconceivable result. Aquinas put this by saying that God can do only what is possible absolutely. Since a contradiction is not a possible state of affairs, it is no limitation on God's power that he cannot bring it about. From the middle ages the 'paradox of the stone' has exercised philosophers. Can God create a stone so heavy he cannot lift it? If we say 'Yes', then there is something he cannot do, namely, lift such a stone. If we say 'No', there is still something he cannot do, namely, create such a stone (see Rosenkrantz and Hoffman 1980).

A more obviously religiously important problem has to do with God's ability to do wrong. If God is essentially perfectly good, it is impossible that he should act wrongly. But then this is something he cannot do, so how can he be omnipotent? Both Anselm and Aquinas answer this by maintaining that since to do wrong is to fall short of a perfect action, omnipotence implies the inability to do wrong rather than the ability to do it. But this looks like fudging. A better answer would be that since God's doing wrong is an inherently impossible state of affairs, there would be no lapse from omnipotence in not being able to realize it, any more than in not being able to realize any

other impossible state of affairs (see Pike 1969) (see Omnipotence).

Omniscience. The most widely discussed problem in this area concerns divine foreknowledge and its relation to human free will. If God is omniscient, he knows everything there is to know, including future human actions. But then how can any of those actions be free? If God knows now that I will accept a certain invitation tomorrow, how can it be that I have any choice in the matter? Surely I can't do anything contrary to what God knows; and so it is not within my power to do anything on this point except accept the invitation. I have no choice; I am not free. But if I never have a choice about what I do, how can I be responsible for my actions?

The problem is given classic expression in Book V of *The Consolation of Philosophy* (525-6) by Boethius (§5). His solution, which was accepted by Anselm, Aquinas, and many other medieval philosophers, was that God's being is not temporal. God does not live through a succession of moments but enjoys, in Boethius' memorable phrase, 'the complete possession all at once of illimitable life' (*The Consolation of Philosophy* V, pr. 6). Hence God does not know in advance what choices I will make, for God never occupies any temporal standpoint. As eternal rather than temporal, he is all at once simultaneous with every moment of time. Hence he knows what I do because, so to say, he 'sees' me doing it when I do it. Therefore there is no threat to human free will (see Eternity).

Though the doctrine of divine atemporality was widely held in the Middle Ages, as well as by many modern theologians, including Schleiermacher, the father of liberal Protestant theology, it has been severely criticized in this century as being unbiblical and as rendering incoherent any notion of divine action in the world (see Pike 1970). It has been vigorously defended recently by Stump and Kretzmann (1981), and by Leftow (1991). However, various attempts have been made to reconcile divine omniscience and human free will without denying divine temporality. One of the most influential is that of William of Ockham, whose seminal idea ran something like this: Even though God's knowing today that I will wash the windows tomorrow entails that I will wash the windows tomorrow, that does not mean that his foreknowledge renders it *necessary* that I will wash the windows tomorrow, and hence does not imply that I have no choice. It is all a question of what depends on what. The past is necessary in the sense that nothing we can do now can alter it. But God's knowledge of future contingent facts is not a 'pure' past fact. It depends for what it is on the future. God knows that I will wash the windows tomorrow because I will wash the windows tomorrow. That is, God's knowledge of what will happen tomorrow is partly a function of what will happen tomorrow. So that leaves me free to have a choice. It is because of the choice that I will make at that time that God's past state is one of knowledge (see Ockham's *Predestination, God's Foreknowledge, and Future Contingents*, q.1, M). A number of contemporary philosophers - for example Plantinga (1986) and Freddoso (1983) - have developed these Ockhamist ideas in new and fruitful ways. Various other solutions to the problem have been developed recently. Some have suggested a limitation of divine omniscience to exclude foreknowledge of free actions, on analogy with limitations on omniscience mentioned above (Swinburne 1977; Hasker 1989). Freddoso has revived Luis de Molina's doctrine of 'middle knowledge', knowledge of what free creatures would freely do if placed in a certain situation (see Molina, L. de §3; Omniscience). The problem of divine foreknowledge and human free will has been widely debated in contemporary philosophy of religion; a useful selection of articles can be found in the anthology edited by Fischer (1989).

7 The problem of evil

'Evil' as understood here ranges over anything undesirable, anything we would be better off without. It is not restricted, as it is in ordinary usage, to wrong actions, or wickedness. It also includes the suffering of sentient creatures, which is termed 'natural evil', in contrast to 'moral evil'. Evil is a serious, perhaps the most serious, problem for theistic religion just because it seems obvious at first sight that an omnipotent and perfectly good God would not allow any evil in his creation (see Evil, problem of). Being omnipotent, he could prevent it, and being perfectly good, he would do so. How then can there be evil if the world is governed by such a deity?

This problem has been with us since the beginning of philosophy in ancient Greece, and it has been extensively discussed in Christianity and other theistic traditions (see Evil). The most common line in Christian theology has been that moral evil is the result of wrong choices (sins) by free created agents (angels and humans), and that natural evil is either a divine punishment for sin or is involved in the corruption of nature that is consequent on angelic and human sin. Here, however, we are concerned with treatments of the problem that are philosophical rather than theological. The most prominent of these can be traced back at least as far as St Augustine (§9), and

they were taken up by many of his successors. Their exposition in Aquinas' *Summa theologiae* Ia, qq.48-9, will be utilized here. First, all evil is a *privation* of something a being would have naturally, like blindness, which is a lack of normal sight. (Only a naturally sighted being can be called 'blind'; a stone is not blind.) Thus evil is not a positive 'nature' or attribute. Everything positive is good, and since there can only be a privation where there is something with a positive (good) nature to be deprived, evil always presupposes good and is parasitic on it. This is not to say that evil is unreal or an illusion; it is only to say what kind of metaphysical status it has. And since evil is real, we are still faced with the question of why God brings it about, or at least permits it. Here Aquinas treats moral and natural evil separately. Wrongdoing is in no sense the work of God, though he permits it, because he has chosen to create free agents who have the power of choice between right and wrong, and sometimes choose the wrong. As for natural evil, that is the work of God, and his (allegedly sufficient) reason for including it is the Principle of Plenitude:

> The perfection of the universe requires that there should be inequality in this, so that every grade of goodness may be realized. Now, one grade of goodness is that of the good which cannot fail. Another grade of goodness is that of the good which can fail in goodness…. Now it is in this that evil consists, namely, in the fact a thing fails in goodness.
>
> (*Summa theologiae* Ia, q.48, a.2)

It is for the perfection of the universe as a whole that God brings it about that there are creatures subject to privation as well those that are not. This has felicitously been termed an 'aesthetic' approach to the problem, since it depicts God as a supreme artist, aiming at the most perfect composition of the whole universe.

These Augustinian themes have persisted in discussions of the problem up to the present, though they fail to convince many contemporary thinkers. One of the most famous post-medieval treatments is that of Leibniz (§3) in his *Theodicy* (1710). This is most famous for Leibniz's insistence that God created the best of all possible worlds, since otherwise he would not be perfectly good. (It is noteworthy that Aquinas (*Summa theologiae* Ia, q.25, a.6) denies that God's goodness has this implication. He argues that since whatever the state of creation, God could make it better by adding goods, there can be no best possible creation.) By holding there to be no alternative to regarding this as the best world possible, Leibniz raised the stakes even higher, making it more difficult to understand why there is evil in the world. He makes many suggestions as to how things that are undesirable in themselves can lead to goods that far outweigh them, but he makes no major advances in this beyond the medieval tradition.

A contemporary thinker, John Hick (1978), has unearthed and developed an important alternative to the Augustinian approach, one which he traces to the second-century Christian theologian Irenaeus. The point of natural evil in the divine plan is its usefulness in 'soul making', giving people the opportunity to develop morally and spiritually in dealing with the suffering and misery in their lives (see also Stump 1985).

Since evil arises in its acutest form only if God is regarded as omnipotent, it is not surprising that it has occurred to some to challenge that assumption. A relatively early example is Mill (1874). In this century, Charles Hartshorne (1941, 1984), following the lead of Alfred North Whitehead (§4), has forged a highly influential 'process theology', in which God is far and away the most powerful being, but is not omnipotent. Instead, God and the world are coexistent and equally necessary. What God does is to work for order, harmony and fulfilment in the world, but without an absolute ability to bring any of this about by a simple act of will. For anything undesirable in the world, we can say that God is doing the best he can to bring good from it (see Process theism).

8 The epistemology of religious belief

Though it is only recently that this topic has been a major preoccupation in philosophy of religion, it is not without historical roots. The question of the nature and status of religious faith has concerned theologians and philosophers at least since the early Christian centuries. Faith is a multifaceted attitude, involving affective and behavioural as well as cognitive components. Concentrating here on the belief component, what are the appropriate standards by which to assess religious belief for rationality, justification, knowledge, and the like? A major issue from the beginning has been the place of reason in all this. Must one have adequate reasons for a religious belief in order to hold it justifiably? Or is that the wrong way to look at the matter? Views on this issue range all the way from that of Tertullian (160-225), who is famous for the dictum concerning the Incarnation, 'I believe it because it is

absurd', thus hurling his opponents' reproach into their teeth, to Kant's rationalism, which expresses itself in the title of his major work in the field, *Religion Within the Bounds of Reason Alone* (1793). Most treatments fall somewhere between these extremes. On the one hand, when we look at the full range of the beliefs of an actual religion, there is general agreement that not all those beliefs can be established by unaided human reason. If we are to have any basis for them they must be disclosed to us by God, by divine revelation. In Christianity this is true of the Incarnation, as well as beliefs about divine purposes for, requirements on, and interaction with human beings. Though it is often held that God accompanied his major revelations with miracles to indicate their status, it is also widely held that these indications do not constitute a decisive proof of that status. Hence it has been thought that divine assistance is required for a person to have firm faith in divine revelation, that faith is, at least in part, a gift of God. On the other hand, there are basic beliefs that are often regarded as susceptible of rational proof - the existence and nature of God, and the immortality of the soul, for example. During the first Christian millennium no sharp distinction was made between these two groups of beliefs. With Augustine, for example, it is difficult to say whether he meant to give rational arguments for the doctrine of the Trinity, or only to explain its meaning. By the thirteenth century, however, we find Aquinas (§14) making a clear distinction between the preambles of faith that could be established by philosophical argument and the remainder that rested on divine testimony.

The Thomistic synthesis fell apart in the modern period under the impact of increasing doubts about both of Aquinas' divisions. David Hume (§2), in the chapter on miracles in his *Enquiry Concerning Human Understanding* (1748) argued that since in order to count as a miracle an event must be contrary to our general experience, and since that experience makes it extremely unlikely that such a thing should happen, a report of a miracle would need an enormous weight of testimony to outweigh that intrinsic improbability, a weight that no report of the miraculous ever displays. Thus, said Hume, we can never be justified in accepting a report of a miracle. As for faith as a gift of God, believing in the absence of sufficient reasons has often been deemed unworthy of a rational agent. This attitude was given classic expression in the late nineteenth century in W.K. Clifford's 'The Ethics of Belief', where he says that 'It is wrong always, everywhere, and for every one, to believe anything upon insufficient evidence' (1879: 183). Finally, with the rejection of the Aristotelian philosophy on which Aquinas' arguments for the existence and nature of God rest, those arguments lost their appeal. The enterprise of providing other arguments for the existence and nature of God was continued by such thinkers as Descartes, Leibniz, Locke (§§6-7) and Berkeley (§§3, 6-7), but by the latter part of the eighteenth century Kant was arguing that it is impossible that any such arguments could be productive of knowledge, though, as pointed out above, he held that we could exhibit the existence of God as a necessary presupposition of morality. Since Kant, although many thinkers have continued to propound arguments for the existence of God, the enterprise has not regained its former prestige.

Not everyone took the failings of natural theology to reflect badly on religion. The nineteenth-century Danish religious thinker Søren Kierkegaard (§§4-5) was a modern Tertullian who passionately argued that rational argument, so far from being required by faith, is incompatible with it. Faith requires a leap, a risk. Seeking the security of rational proof is a snare and a deception; it is a way of avoiding the trust that God requires of us. Though Kierkegaard has been enormously influential, especially in this century, other voices have also been heard. John Henry Newman, in his *An Essay in Aid of a Grammar of Assent* (1870), stressed the continuity of religious belief with other areas in which trained sensitive judgment is needed to assess the bearing of a complex set of diverse considerations. This approach has been continued in this century in the work of Basil Mitchell (1981).

The most prominent position on the current scene is 'Reformed epistemology', so called because its advocates are self-consciously working in the Reformed tradition stemming from John Calvin. A notable example is Alvin Plantinga (1983), who attacks 'evidentialism', the view that religious belief is irrational unless supported by adequate evidence (see Religion and epistemology §§1-3). In this he sounds like Kierkegaard, but the alternatives they suggest are quite different. Plantinga argues that religious beliefs can be 'properly basic', that is, rationally justified even though based on no reasons whatever. Thus he is no more irrationalist than the evidentialists he opposes. He simply has a different theory as to the conditions for rational religious belief.

Religion, philosophy of

Philosophy of religion is philosophical reflection on religion. It is as old as philosophy itself and has been a standard part of Western philosophy in every period (see Religion, history of philosophy of). In the last half of the twentieth century, there has been a great growth of interest in it, and the range of topics philosophers of religion have considered has also expanded considerably.

Philosophy of religion is sometimes divided into philosophy of religion proper and philosophical theology. This distinction reflects the unease of an earlier period in analytic philosophy, during which philosophers felt that reflection on religion was philosophically respectable only if it confined itself to mere theism and abstracted from all particular religions; anything else was taken to be theology, not philosophy. But most philosophers now feel free to examine philosophically any aspect of religion, including doctrines or practices peculiar to individual religions. Not only are these doctrines and practices generally philosophically interesting in their own right, but often they also raise questions that are helpful for issues in other areas of philosophy. Reflection on the Christian notion of sanctification, for example, sheds light on certain contemporary debates over the nature of freedom of the will (see Sanctification).

1 Philosophy and belief in God

As an examination of mere theism, the core of beliefs common to Western monotheisms, philosophy of religion raises and considers a number of questions. What would anything have to be like to count as God? Is it even possible for human beings to know God's attributes (see God, concepts of; Negative theology)? And if so, what are they? Traditionally, God has been taken to be a necessary being, who is characterized by omniscience, omnipotence, perfect goodness, immutability and eternity (see Necessary being; Omniscience; Omnipotence; Goodness, perfect; Immutability; Eternity), who has freely created the world (see Creation and conservation, religious doctrine of; Freedom, divine), and who is somehow specially related to morality (see Religion and morality).

This conception of God takes God to be unique (see Monotheism), unlike anything else in the world. Consequently, the question arises whether our language is capable of representing God. Some thinkers, such as Moses Maimonides, have argued that it is not and that terms applied to God and creatures are equivocal. Others have argued that our language can be made to apply to God, either because some terms can be used univocally of God and creatures, or because some terms used of creatures can be applied to God in an analogical sense (see Religious language).

Not everyone accepts the traditional characterization of God, of course. Pantheists, for example, reject the distinction between God and creation (see Pantheism). Certain philosophers have objected to the traditional conception on the grounds that it leaves certain philosophical problems, such as the problem of evil, insoluble (see Process theism). And many feminists reject it as patriarchal (see Feminist theology).

Given the traditional conception of God, can we know by reason that such a God exists? There are certain arguments that have been proposed to demonstrate the existence of God so understood (see God, arguments for the existence of; Natural theology). The ontological argument tries to show that a perfect being must exist (see Anselm of Canterbury). The cosmological argument argues that the existence of the world demonstrates the existence of a transcendent cause of the world. And the teleological argument argues from design in nature to the existence of a designer. Some philosophers have maintained that the widespread phenomenon of religious experience also constitutes an argument for the existence of a supernatural object of such experience (see Religious experience; Mysticism, history of; Mysticism, nature of). Most contemporary philosophers regard these arguments as unsuccessful (see Atheism; Agnosticism).

But what exactly is the relation between reason and religious belief? Do we need arguments? Or is faith without argument rational? What is faith? Is it opposed to reason? Some philosophers have argued that any belief not based on evidence is defective or even culpable. This position is not much in favour any more. On the other hand, some contemporary philosophers have suggested that evidence of any sort is unnecessary for religious belief. This position is also controversial (see Faith; Religion and epistemology).

Some philosophers have supposed that these questions are obviated by the problem of evil (see Evil, problem of), which constitutes an argument against God's existence. In their view, God and evil cannot coexist, or at any rate the existence of evil in this world is evidence which disconfirms the existence of God. In response to this challenge to religious belief, some philosophers have held that religious belief can be defended only by a theodicy, an attempt to give a morally sufficient reason for God's allowing evil to exist. Others have thought that religious belief can be defended without a theodicy, by showing the weaknesses in the versions of the argument from evil against God's existence. Finally, some thinkers have argued that only a practical and political approach is the right response to evil in the world (see Liberation theology).

Those who use the existence of evil to argue against the existence of God assume that God, if he existed, could and should intervene in the natural order of the world. Not everyone accepts this view (see Deism). But supposing it is right, how should we understand God's intervention? Does he providentially intervene to guide the world to certain ends (see Providence)? Would an act of divine intervention count as a miracle? What is a miracle, and is it ever rational to believe that a miracle has occurred (see Miracles)? Some people have supposed that a belief that miracles occur is incompatible with or undermined by a recognition of the success of science. Many people also think that certain widely accepted scientific views cast doubt on particular religious beliefs (see Religion and science).

2 Philosophy and religious doctrines and practices

In addition to the issues raised by the traditional conception of God, there are others raised by doctrines common to the Western monotheisms. These include the view that the existence of a human being does not end with the death of the body but continues in an afterlife (see Soul, nature and immortality of the; Reincarnation; Resurrection). Although there is wide variation in beliefs about the nature of the afterlife, typically the afterlife is taken to include heaven and hell. For some groups of Christians, it also includes limbo and purgatory. All of these doctrines raise an array of philosophical questions (see Heaven; Hell; Limbo; Purgatory).

There is equally great variation in views on what it takes for a human being to be accepted into heaven (see Salvation). Christians generally suppose that faith is a necessary, if not a sufficient, requirement (see Justification, religious). But they also suppose that faith is efficacious in this way because of the suffering and death of Jesus Christ (see Incarnation and Christology; Trinity). Christians take sin to be an obstacle to union with God and life in heaven, and they suppose that Christ's atonement is the solution to this problem (see Sin; Atonement). Because of Christ's atonement, divine forgiveness and mercy are available to human beings who are willing to accept it (see Forgiveness and mercy). Most Christians have supposed that this willingness is itself a gift of God (see Grace), but some have supposed that human beings unassisted by grace are able to will or even to do what is good (see Pelagianism). How to interpret these doctrines, or whether they can even be given a consistent interpretation, has been the subject of philosophical discussion.

The religious life is characterized not only by religious belief and experience but by many other things as well (see Phenomenology of religion). For many believers, ritual and prayer structure religious life (see Ritual; Prayer). Christians also suppose that sacraments are important, although Protestants and Catholics differ on the nature and number of the sacraments (see Sacraments). For Christians, the heart of the religious life, made possible by the atonement and the believer's acceptance of grace, consists in the theological virtues - faith, hope, and charity (see Theological virtues).

Many religious believers suppose they know that these and other things are essential to the religious life because God has revealed them (see Revelation). This revelation includes or is incorporated in a book, the Qur'an for Muslims, the Hebrew Bible for Jews, and the Old and New Testaments for Christians. How the texts in this book are to be understood and the way in which religious texts are to be interpreted raise a host of philosophical issues (see Hermeneutics, biblical).

Certain thinkers who are not themselves philosophers are none the less important for the philosophy of religion and so are also included in this encyclopedia. These include, for example, John Calvin and Martin Luther, whose views on such issues as justification and atonement significantly influenced the understanding of these notions, and Jacques Maritain and Pierre Teilhard de Chardin, whose influence on contemporary philosophical theology has been significant.

Religious experience

Philosophy is interested in religious experience as a possible source of knowledge of the existence, nature and doings of God. The experiences in question seem to their possessors to be direct, perceptual awarenesses of God. But they may be wrong about this, and many philosophers think they are. Many philosophers think that such experiences are never what they seem, and that no one has a veridical experience of the presence and/or activity of God. The main philosophical reason for supposing that such experiences are in fact sometimes veridical is a principle according to which any apparent experience of something is to be regarded as veridical unless we have sufficient reasons to the contrary. Experiences are innocent until proven guilty. If we do not accept that principle, we will never have sufficient grounds for taking any experience to be veridical - religious, sensory or whatever.

There are critics who think that we do have sufficient reasons to the contrary in the case of religious experience. For one thing, we do not have the same capacity for intersubjective checks of religious experiences that we have with sense perceptions. But to this it can be replied that we should not suppose that sense perception represents the only way in which we can achieve genuine cognitive contact with objective reality. For another thing, it is widely supposed that religious experience can be adequately explained by psychological and social factors, without bringing God into the picture. But even if this-worldly factors are the only immediate causes of the experience, God could figure as a cause farther back in the causal chain. Finally, the disagreements between alleged experiences of God, especially across different religions, provide a reason for doubting the deliverances of religious experience. But it is possible for a number of people to be genuinely experiencing the same thing, even though they disagree as to what it is like. This is a common occurrence in sense perception.

1 The experience of God

The term ‘religious experience’ is properly used for any experiences one has in connection with one’s religious life, including a sense of guilt or release, joys, fears, longings, a sense of gratitude, and so on. But the usual philosophical concern with religious experience has a much narrower focus. It is concerned with experiences taken by the subject to be an experiential awareness of God. To cast the net as widely as possible, and to avoid restricting the discussion to one kind of religion, such as ‘theistic’ religions that think of God in personal terms, let us understand ‘God’ here to range over any supreme reality, however construed.

Here is an anonymous report of such an experience:

> All at once I… felt the presence of God - I tell of the thing just as I was conscious of it - as if his goodness and his power were penetrating me altogether… Then, slowly, the ecstasy left my heart; that is, I felt that God had withdrawn the communion which he had granted… I asked myself if it were possible that Moses on Sinai could have had a more intimate communication with God. I think it well to add that in this ecstasy of mine God had neither form, color, odor, nor taste; moreover, that the feeling of his presence was accompanied by no determinate localization… But the more I seek words to express this intimate intercourse, the more I feel the impossibility of describing the thing by any of our usual images. At bottom the expression most apt to render what I felt is this: God was present, though invisible; he fell under no one of my senses, yet my consciousness perceived him.
>
> (James [1902] 1982: 68)

This report is typical in several respects. First, the awareness of God is experiential, as contrasted with abstract thought (thinking of God, reasoning about God, or asking questions about God). Like sense experience it seems to involve a presentation of the object. The subject takes God to have been present, to have been given to the subject’s awareness, in something like the way in which a tree is presented to one’s awareness when one sees it.

Second, the experience is direct. The subject feels immediately aware of God, rather than being aware of God through being aware of something else. That is, it seems to be analogous to directly seeing another human being in front of you, rather than seeing that person on television, where one is aware of the person through being aware of something else, in this case the television screen. People also report indirect experiences of God:

> There was a mysterious presence in nature and sometimes met within the communion and in praying by oneself, which was my greatest delight, especially when as happened from time to time, *nature became lit up*

> *from inside* with something that came from beyond itself (or seemed to do so to me).
>
> (Beardsworth 1977: 19; original italics)

Third, the experience is completely lacking in sensory content. It is a wholly non-sensory presentation of God. But there are also experiences of God that involve seeing or hearing something:

> I awoke and looking out of my window saw what I took to be a luminous star which gradually came nearer, and appeared as a soft slightly blurred white light. I was seized with violent trembling, but had no fear. I knew that what I felt was great awe. This was followed by a sense of overwhelming love coming to me, and going out from me, then of great compassion from this Outer Presence.
>
> (Beardsworth 1977: 30)

Many find it incredible that a non-sensory experience should involve a presentation of something, but this seems a baseless prejudice. Why should we suppose that our modes of sensory receptivity constitute the only possible vehicles of an experiential awareness of external reality?

Finally, it is a focal experience, one in which the awareness of God attracts one's attention so strongly as to blot out all else for the moment. But there are also lower-intensity experiences that persist over long periods of time as a background to everyday experiences, as in this report from James: 'God surrounds me like the physical atmosphere. He is closer to me than my own breath. In him literally I live and move and have my being' ([1902] 1982: 71-2).

The present discussion will be limited to direct, non-sensory, focal experiences, since they constitute the most distinctive and striking claims to be experientially aware of God.

A great deal of the literature on this subject concentrates on mystical experience, understood as a state in which all distinctions are transcended, even the distinction between subject and object. The person is aware of a seamless unity. Such experience falls under our general category, for it is typically taken by the mystic to be a direct awareness of supreme reality. But since experiences like this pose special problems of their own, the present entry will focus primarily on more moderate cases like the ones cited, in which subjects do not seem to lose their own identity. In spite of this, the term 'mystical experience' will be used as a convenient way of designating what is taken by the subject to be a direct experience of God. Since these subjects suppose themselves to be aware of God in a way analogous to that in which one is aware of things in the physical environment by sense perception, the term 'mystical perception' will be used.

2 Mystical experience as a basis for beliefs about God

The chief philosophical interest in mystical experience concerns the possibility that it serves as a source of knowledge, or justified belief, about God. Those who have such experiences typically take themselves to have learned something from them, as well as receiving additional confirmation of beliefs already held. Usually they suppose only a limited set of beliefs to be justified in this way. These include the belief that God exists, certain beliefs about his nature (for example, that he is loving or powerful), and beliefs about what God is doing *vis-à-vis* the subject at the moment - comforting, condemning, forgiving, inspiring, communicating a certain message. It is rare, at best, for someone to think it possible to come to know that God delivered the Israelites from slavery in Egypt or that he is three persons in one substance just from an experience of God (unless that is something that the subject takes God to be saying). But the beliefs that are derived from such experiences typically play a central role in one's religious life. In another anonymous report, the writer, after speaking of an experience in which he 'felt the perfect unison of my spirit with His' goes on to say: 'My highest faith in God and truest idea of him were then born in me.... My most assuring evidence of his existence is deeply rooted in that hour of vision, in the memory of that supreme experience' (James [1902] 1982: 66-7).

The fact that subjects take themselves to acquire knowledge of God from mystical perception does not guarantee that they do. One can be misled even by sense experience. One can suppose that one saw, at dusk, that there was a car in the distance when it was actually a cow. And in extreme cases one can be subject to complete hallucinations, like Macbeth falsely taking there to be a dagger in front of him. With both sense experience and mystical experience, contradictions between reports prevent us from taking all of them to be veridical. As for mystical

experience, we need look no further than the many cases in which someone supposes that God commanded the murder of as many people of a certain sort as possible, in contrast to those instances in which one is aware of God as supremely loving. In both areas of experience there are two ways in which one can acquire false beliefs. One may not be experiencing the thing, or sort of thing, one supposes one is experiencing. The two cases of sensory illusion just mentioned illustrate this, as do the cases of people supposing themselves to be aware of God telling them to do things that God would not tell anyone to do. But second, even if one is genuinely aware of the sort of thing in question, the beliefs one forms about it may be mistaken. I may genuinely see a car in the distance, but mistakenly think it is moving. I may genuinely be aware of the presence of God, but mistakenly suppose that he refuses to forgive me. A comprehensive discussion would go into both these ways in which experiences can be misleading. But since sceptics about religious experience usually take it that no one is ever genuinely aware of a really existing God, we will concentrate on the former, more radical criticism. The main issue will be whether mystical experiences are significantly often genuine experiences of God, are veridical experiences.

Reasons for a positive answer can be divided into theological and philosophical ones. The former comprise any components of the belief system of a given religion that give us reason for thinking either that God is in principle accessible to human experience, or that particular persons have experienced God's presence on one or another occasion. Theological considerations are out of bounds here. As for philosophical reasons, the most important one, perhaps the only important one, goes as follows.

Any supposition that one perceives something to be the case - that there is an elephant in front of one or that God is strengthening one - is *prima facie* justified. That is, one is justified in supposing this unless there are strong enough reasons to the contrary, strong enough overriders. Overriders can be divided into *rebutters*, strong enough reasons for the falsity of the belief, and *underminers*, strong enough reasons for supposing that the experience, in this instance, does not sufficiently support the belief. In the elephant case, strong reasons for thinking that there is no elephant in the vicinity would be a rebutter. A reason for supposing oneself to be subject to hallucinations, perhaps because of some drug, would be an underminer. According to this position, beliefs formed on the basis of experience possess an initial credibility by virtue of their origin. They are innocent until proven guilty.

This position has been widely advocated for sense perception (see Chisholm 1977, ch. 4). Swinburne (1979, ch. 13) applies it to mystical experience, terming it 'The Principle of Credulity'. Alston (1991) gives it a more social twist; the claim is that any socially established 'doxastic (belief-forming) practice' is to be accepted as a source of (generally) true beliefs unless there are sufficient reasons against its reliability. The position is usually supported by the claim that unless we accord a *prima facie* credibility to all experiential reports, we can have no sufficient reason to trust any experiential source of beliefs. This is the only alternative to a thoroughgoing scepticism.

As applied to mystical experience, this '*prima facie* credibility' position implies that whenever anyone reports having perceived God as being or doing so-and-so, the report is to be accepted as true unless we have sufficient reasons for refusing to do so. Lest one fear that this lets in any crackpot report, remember that we wouldn't regard reports as 'crackpot' unless we had reasons, from other reports of mystical perception or from other theological sources, for denying that what the 'crackpot' believes about God is correct.

3 Objections to regarding experiences of God as veridical

A large number of contemporary philosophers deny that anyone ever genuinely perceives the presence or activity of God. Most of the reasons for this are based on differences, real or alleged, between sense experience and mystical experience. Since we are all, in practice, completely confident of the by-and-large reliability of sense perception, positive analogies between the two will be taken to support a positive epistemic assessment of mystical perception, whereas differences between them will be taken to support a negative assessment (see Alston 1991, chaps 5-7, for further discussion; also Wainwright 1981, ch. 3).

The first and most obvious reason for a negative assessment concerns certain striking differences between sense experience and mystical experience. Sense experience is a common possession of all human beings, whereas, so far as we can tell, mystical experience is not. Even if we are careful to include dim, background experiences in the reckoning, it is foreign to a considerable proportion of the population. Moreover, even for those who are privileged with both, they play vastly different roles in one's life. Sense experience is continuously, insistently and unavoidably present during all our waking hours, while mystical experience, except for a few choice souls, is a

rare phenomenon. Sense experience, especially vision, is vivid and richly detailed, bursting with information, more than we can possibly encode; while mystical experience, by comparison, is meagre and obscure. These differences can lead one to deny that mystical experience is a conduit of information about objective reality.

The differences certainly render mystical experience much less useful as a source of information, but that is quite different from saying that, where it exists, it is never or seldom a veridical experience of God, or that it provides no information about God. Regarding the partial distribution in the population, the defence can point out that there is no a priori reason to suppose that a doxastic practice engaged in by only a part of the population is less likely to be a source of truth than one we all engage in. There are many reliable practices engaged in by only a small minority - for example, research in the physical sciences and wine tasting. We have to learn from experience which features of the world are open to all and which are open only to some people who satisfy special requirements. And it would beg the question to think that experience tells us that no aspect of reality is disclosed in mystical experience. Similar points can be made about the lesser frequency and lesser detail of mystical experience. That shows that it provides less information than sense experience, but not that it provides none.

A second common charge is that the mystic is simply reading prior religious beliefs into a cognitively indifferent (perhaps purely affective) experience, rather than being directly aware of supreme reality. By and large, only Christians report experiences of Christ, only Hindus of Vishnu, and only Buddhists of *nirvāṇa*. Nevertheless, the charge is a serious oversimplification. There are many conversions on the basis of an alleged experience of God. In these cases, subjects do not suppose themselves to be aware of what they were antecedently expecting; quite the contrary. To be sure, one cannot report what one was aware of except by using concepts one has (what else?). But this is as true of sense perception as of mystical perception. When I report what I saw from the train window, I use my conceptual repertoire; I say that I saw houses, trees, a river, and so on. Sense perception and mystical perception would not seem to differ in this respect.

A third reason for partiality is the supposition that mystical experience can be adequately explained in purely naturalistic terms, and that this fact shows it not to constitute an experience of a supernatural reality (see Mackie 1982). It is a basic principle of perception that we cannot be genuinely perceiving an entity that does not make a significant causal contribution to the experience involved. If a tree on the other side of a high stone wall plays no role in eliciting my present visual experience, then I cannot be *seeing* that tree, whatever my experience is like. But if the causes of a religious experience are purely this-worldly, then God plays no role in producing it. Hence I am not really perceiving God in that experience, however it might seem.

There are a number of points the defence might make. First, the claim to an adequate naturalistic causal explanation can be challenged. We are certainly not in possession of any such explanation. At most there are programmatic suggestions - from psychoanalysis, social psychology, and other quarters - as to the general form such an explanation might take. Second, the causal requirement for genuine perception might be challenged, though not with much plausibility. The most impressive defence would be the following. A consideration of sense perception shows that even there the object perceived need not be among the *proximate* causes of the experience. The immediate causes of a sense experience are all within the subject’s brain, which is not perceived. When the causal requirement is satisfied in sense perception, it is by the perceived object’s figuring further back along the causal route leading to the experience. Hence, even if the immediate causes of a mystical experience are all natural, that leaves open the possibility that God figures among the more remote causes of the experience, and in such a way as to qualify as what is perceived. Hence a proximate naturalistic explanation of mystical experience poses no threat to the veridicality of (some) mystical perception.

A fourth important difference between sensory and mystical perception is that there are effective tests for accuracy in the case of the former but not the latter. When someone claims to have seen something - for example, an aeroplane overhead - there are procedures that can yield a conclusive verdict on that claim. We can look into whether suitably qualified observers saw an aeroplane, and check appropriate sources to find whether there are any records of an aeroplane being there at that time. But nothing like this is available for mystical perception. There are checks that are commonly applied in established mystical communities, such as conformity with the background system of religious doctrine, and conducivity to spiritual development and purity of life. But they are far from yielding comparable results. Moreover, there is nothing like the check of other observers we have for sense perceptual reports. If I claim to have been aware of God’s sustaining me in being, there are no conditions

such that if someone else who satisfies those conditions is not (at that time or any time) aware of being sustained in being by God, I will take that as showing that I was mistaken. And the argument of the critic is that this discredits the claim of the mystic to be aware of an objective reality. If my claims to perceive something objective cannot be validated by intersubjective agreement, they have no standing (Martin 1959; Rowe 1982).

The best response to this criticism is to charge the critic with what we might call ‘epistemic imperialism’, unwarrantedly subjecting the outputs of one doxastic practice to the requirements of another. The complaint is that a mystical perception cannot lay claim to putting its subject into effective touch with objective reality because the subject cannot validate this status in the same way as with sense perceptions. But there are various sources of belief that work quite differently from sense experience in this respect. Consider introspection, one’s awareness of one’s own conscious states. My report that I feel relieved cannot be validated by considering whether someone else, who satisfies certain conditions, feels my relief. But it would be absurd to reject introspection as a source of knowledge because of the unavailability of such tests. Unless critics can give a convincing reason for supposing that the criteria available for sense perception constitute a necessary condition for *any* experiential access to objective reality, they are guilty of epistemic chauvinism (to change the metaphor) in rejecting mystical perception for this reason. Epistemic chauvinism is also exhibited by the first criticism in this section, to which the response was to ask why one should suppose that a mode of experience different from sense experience in the ways specified should be less likely to be a source of knowledge.

Another disability of some of the above criticisms is the use of a double standard, whereby mystical perception is taken to be discredited by some feature it shares with sense perception. This is exhibited by the second and third criticisms above. We saw that both modes of perception use antecedent conceptual schemes to report what is perceived, and that both locate the object perceived among remote rather than proximate causes of the experience.

The final criticism concerns the fact of religious pluralism, probably the most epistemologically significant difference between mystical perception and sense perception. Human beings at all times and places and in all cultures use pretty much the same conceptual scheme to specify what they perceive by the senses. The extent to which there is less than complete agreement is a matter of controversy among anthropologists and historians, but the commonality is clearly much greater than it is with mystical experience. The full range of religions, past and present, differ widely in their conceptions of ultimate reality, and their beliefs about it differ even more widely. This point still holds if we confine ourselves to contemporary major world religions. Since the conceptions and beliefs of the various religions are the ones used by people to articulate what they take themselves to be aware of in mystical experience, those articulations are correspondingly different and often contradict each other. ‘Theistic’ religions such as Judaism, Christianity and Islam think of supreme reality as a personal creator who enters into personal relationships with us. Buddhism and certain forms of Hinduism think of ultimate reality in more impersonal terms, as an undifferentiated unity of which nothing can literally be said, or as a void or ‘Nothingness’. The theistic religions also differ in what they believe about what God has done in history, what his plans are and what he requires of us. In the face of this unresolved diversity, how can we think that mystical experience is a conduit of objective truth?

It is important to be clear as to what is and is not involved in this problem. It was pointed out earlier that it would not be sensible to think that mystical perception can generate a complete system of religious belief. Hence the experiential reports of Christians and Muslims might not contradict each other, even though there are contradictions between the two complete bodies of belief. But even if the experiential reports are contradictory to a certain extent, mystical perception could still constitute a genuine awareness of a supreme reality. Two people can both genuinely perceive something even if they disagree as to what it is like. Two witnesses to a car accident might both have really seen the accident, though their accounts of what happened are importantly different. By the same token, mystics from widely different religions might genuinely perceive the same ultimate reality, even if what they perceive it as is quite different.

Still, it must be admitted that the unresolved incompatibilities in mystical perceptual reports count as negative evidence for the claim that mystical perception is, often, a genuine awareness of supreme reality, though for the reasons just given it can hardly be regarded as conclusive evidence against that claim. On this point there would seem to be a standoff between the mystic and the critic, a standoff that would be resolved by strong enough reasons for regarding one of the competing religious traditions to be closest to the truth or, contrariwise, by strong

enough reasons for regarding no religions to have any truth about supernatural dimensions of reality.

Religious language

The main philosophical interest in religious language is in the understanding of what purport to be statements about God. Can they really be what they seem to be - claims to say something true about a divine reality? There are several reasons for denying this. The most prominent of these stems from the verifiability criterion of meaning, according to which an utterance can be a statement that is objectively true or false only if it is possible to verify or falsify it empirically. It is claimed that this is not possible for talk about God. However, the verifiability criterion itself has been severely criticized. Moreover, many religious beliefs do have implications that are, in principle, empirically testable, though not conclusively.

If one is moved to reject the idea that statements about God are what they seem to be, they can be taken as expressions of feelings and attitudes, and/or as guides to a life orientation. To be sure, religious utterances can have these functions even if they are also genuine statements of fact.

If one believes there to be genuine true-or-false statements about God, there are still problems as to how to understand them. We can focus on the construal of the predicates of such statements - for example, 'made the heavens and the earth' and 'commissioned Moses to lead the Israelites out of Egypt'. There is a serious problem here because of two basic features of the situation. First, the terms we apply to God got their meaning from their application to creatures, particularly human beings. Second, God is so radically different from us that it seems that these terms cannot have the same meaning in the two uses. One possibility here is that all these terms are used metaphorically when applied to God, which obviously often happens ('The Lord is my shepherd'). But are there some terms that can be literally true of God? This may be the case if some abstract aspect of the creaturely meaning of a term can be literally applied to God. For example, if one aspect of the meaning of 'makes' when applied to one of us is 'brings about some state of affairs by an act of will', the term 'makes' with that particular meaning might be truly applied to God.

1 The topic

The title of this entry is a misnomer. There is no language peculiar to religion ('Do you speak English, French or religious?'), nor is religion restricted to any particular type of language. A more accurate term for the topic would be 'religious uses of language'. Here we find an enormous diversity. Worshippers engage in praise, thanksgiving, petition, confession, instruction and exhortation. Sacred writings contain cosmological speculations, fictional narratives, historical records, predictions, commandments, theological pronouncements and legal codes. In devotional literature there are biographical reminiscences, theologizing, rules for the spiritual life and descriptions of religious experience. Philosophers of religion have concentrated on a very restricted portion of this plenitude, namely on statements about God or, more generally, about the objects of religious devotion and worship.

There is more than one reason for this selectivity. First, it is the belief aspect of religion with which philosophy is most concerned. This is partly an occupational bias. Philosophy is largely taken up with a critical examination of beliefs, assumptions and presuppositions in all areas. When the inquiry takes a linguistic turn, it is deflected to the linguistic formulations of beliefs. Since the most central statements in a religion are statements about God, they get most of the philosophical attention. Second, the belief system of a religion underlies everything else. Religious believers pray as they do, worship as they do, lead, or try to lead, their lives as they do, take up the attitudes they do, because of what they believe about God. If we are concerned to evaluate a religion, we are well advised to evaluate the belief system of that religion, since its pluses and minuses will have implications for the evaluative status of the whole.

Philosophers raise questions of various degrees of generality about religious statements. Some pose difficulties of understanding. The Christian doctrines of the Trinity (God is three persons in one substance) and the dual nature of Christ (the divine and human natures of one person), the Buddhist doctrine of *nirvāṇa* as the ultimate human fulfilment (is it pure nothingness, or does it have a positive aspect?), and the Hindu doctrine of Brahman (the absolute undifferentiated unity that constitutes all reality) are famous cases. But philosophers have also been concerned with more general questions as to how religious statements are to be understood. Traditionally this investigation has centred on the question of how predicates are to be understood in their application to God, predicates such as 'made the heavens and the earth' and 'knows the inmost secrets of our hearts'. For our grasp of

the subject, ‘God’, presumably comes from some predicates or other. Even if reference to God is at least partly on the basis of experience of God (Alston 1989: ch. 5), still it is also at least partly on the basis of what predicates we apply to him. Thus the question of how to understand predicates as applied to God is the most fundamental issue here.

It has generally been assumed that most apparent statements about God really do have that status, that they are used to make truth claims about a reality that is what it is independently of us, our beliefs, attitudes and conceptual schemes. But in the twentieth century that assumption has frequently been questioned. Hence, before tackling issues about the understanding of theological predicates, the reasons that have been given for denying the credentials of religious statements will be considered, along with the alternative construals of such utterances that have been proposed.

2 Reasons for denying that there are genuine statements about God

These reasons can be ranked under three headings: *metaphysical* - if treated as statements that are true or false, they are all false; *epistemological* - we have no effective way of determining their truth value; and *semantic* - because of the previous epistemological criticism, sentences predicating properties of God do not satisfy necessary conditions for having the kind of meaning (factual meaning) that would fit them for being used to make statements that are true or false.

The *metaphysical* claim is based on a naturalistic or materialistic metaphysics that takes reality to be confined to the ‘natural’ order, that is, to the physical universe in space and time (see Naturalized philosophy of science §1). Since that leaves no room for God, as usually conceived in religion, all statements that purport to refer to such a being are false. To be sure, this is quite compatible with taking what appear to be religious statements to have that status; they just all happen to be false. But if, while embracing naturalism, one is still motivated to hang on to something like traditional religion, the only option is to give religious utterances some nonstandard interpretation.

This line of thought can be no better than the naturalistic metaphysics on which it is based. Though materialists can claim some support from the developments of modern science for the thesis that everything in the spatiotemporal universe is purely physical in nature, it is not clear that they have any significant reason for denying that there are realities of a different order altogether, such as God is typically taken as being.

The *epistemological* reason is that we lack sufficient grounds for supposing that religious statements are true. Whether this is so is an extremely complicated issue that is treated elsewhere (see God, arguments for the existence of; Religion and epistemology; Religious experience). But even if it is so, that only implies that they must be accepted on faith. If one feels uncomfortable with that, it would be another motive for holding that apparent religious statements are not what they seem.

The *semantic* approach draws a stronger conclusion from an epistemological claim like the foregoing. The principle on which this reasoning is based is the verifiability criterion of meaningfulness. According to this principle, a sentence has factual meaning (the kind of meaning that renders it usable to make a statement with a truth value) only if it is in principle possible to verify it or falsify it empirically, on the basis of observations (see Meaning and verification §§2-3). The argument is that alleged statements about God fail this test and hence are not genuine statements of fact. In a famous passage, Antony Flew (1955) posed the rhetorical question, ‘What would have to occur or to have occurred to constitute for you a disproof of the love of, or of the existence of, God?’. The implied answer is that nothing would fit this bill, and, by the same token, nothing would amount to a proof either. Alleged statements about God are only pretend-statements because they are not empirically testable.

It is this argument against the genuineness of statements about God that has received the most press. Again, it can be no stronger than the principle on which it is based, and the verifiability criterion has repeatedly been severely criticized (see Plantinga 1967). But in any case, do statements about God really fall foul of the requirement? That depends on a number of things. First, it depends on what counts as an ‘observation’ or ‘empirical datum’. It makes a big difference whether mystical experience is allowed to count as ‘observation’. Second, it depends on the viability of arguments for the existence of God, such as the teleological argument, that are based on observable features of the universe. And, on the other side, many thinkers take it that massive and apparently undeserved suffering constitutes empirical evidence against the existence of God. Third, it depends on details of the particular religious belief system in question. Many such systems involve fairly straightforward predictions as to what the

gods will do under certain conditions, where these divine actions manifest themselves in sensorily observable changes. In many primitive religions it has been believed that the gods will bring rain or military victory if they are approached through certain rites. In the Judaeo-Christian tradition it is believed that God will see to it that the Church or the chosen people will be finally victorious on earth and that prayers, made in the right spirit and in the right conditions, will be effective. It is true that such predictions come with severe qualifications. We cannot say *when* the Church will be victorious or when the second coming of Christ will inaugurate a new era. And it is impossible to be sure that one has prayed in the right spirit. Thus it is rare to find a decisive empirical test for religious beliefs. (But it is often held that this is true of science as well.) In any event, the issue of whether belief about God is empirically testable to some extent is by no means easily answered.

3 Nonassertive construals of theological statements

If one is convinced that talk of God can be meaningful only if it does not involve statements that are assessable as true or false, there are several options. Here are two:

Expressivism-instrumentalism. This is an analogue of ‘noncognitivism’ or ‘emotivism’ in ethics, a view that also springs from attachment to verificationism and which takes ethical utterances to be expressions of attitudes and emotions, or as recommendations of a policy of action, rather than as statements of fact. A classic version of the application to religion is found in Santayana (1905). On his view, there are two components to a religious doctrine, or ‘myth’. There is (a) an evaluation of some sort, which is (b) expressed in the form of a picture or story. Thus the Christian myth of God’s incarnation in Jesus Christ, and his death on the cross to atone for our sins can be regarded as an expression of the moral value of self-sacrifice. That is the expressive side of the position, but Santayana also thinks of religious myths as *guiding* our lives, our responses to the world. This side of the matter is indicated by the term ‘instrumentalism’, taken from the philosophy of science. The function for which religious beliefs are ‘instrumental’ is not predictive, as in science, but rather ‘life-orienting’ (see Braithwaite 1955).

Symbolisticism. Here a leading figure is Paul Tillich (§§3-5), according to whom it is misguided to ask whether religious doctrines are true or false of God. Since God (the true God, Being-Itself) is beyond any conceptualization (1953: 264-5), it is hopeless to seek any correspondence between what we say about God, and God. Instead, our ‘God-talk’ is made up of symbols of God, which ‘point to’ his reality by ‘participating’ in his power and being. Not only what are commonly recognized as symbols - the lamb, water, the shepherd, and so on - are to be so construed; anything concrete or conceptualizable is a symbol, including Christ, God the Father, and the Holy Spirit. Speaking of God the Father is an appropriate way of symbolizing Being-Itself because fatherhood is one of the ‘places’ in the world where we are ‘grasped’ by the power of Being. But any literal correspondence of our religious utterances with the divine is out of the question.

It must be noted that even if what seem to be factual religious statements do genuinely have that status, they can also function in an expressive-instrumental and a symbolic role.

4 Theological predicates

In discussing the question of how to understand predicates in their application to God we will assume that the arguments of §2 against the genuineness of statements about God are not cogent, and that such statements are to be understood as what they appear to be. Each such statement can be thought of as applying a certain predicate to God. Here is a sample:

(1) made the heavens and the earth;
(2) became incarnate in Jesus of Nazareth;
(3) is omnipotent (perfectly good, loving, wise, omniscient);
(4) forgives the sins of those that repent and turn to him;
(5) told me not to worry so much about trifles;
(6) wills that all people should be saved.

We can roughly divide this list into attributes (3), actions (1, 2, 4, 5) and intentional psychological states (6). The attributes can be seen as derivative from the other types, being properties of God that fit him for actions (loving, omnipotent) or for psychological states (omniscient, wise). Discussions of the topic have tended to concentrate on attributes, perhaps because they can be more concisely formulated, but this tends to distort the subject.

Why should there be a special problem here? We know what it is to tell someone something, to know something, to comfort someone, and so on. Is that not what we are saying of God in these cases?

There is a problem because, first, as the last paragraph suggests, we get our terms (concepts) for talking (thinking) about God from our talk and thought about creatures, particularly human beings, and, second, God is so different from human beings as to make the use of these terms problematic.

Regarding the first point, does it just happen that all the terms we use to specify God's attributes, actions and psychological states are terms we also use for human beings, or is there some deep reason for this? The latter alternative is supported by the following considerations. We have the kind of cognitive access to each other that makes it possible to establish a common language for talking about us. But we do not have the same resources for setting up an independent language for talking of God. To put it roughly, the parent can know when the child is perceiving another person talking or hugging someone or criticizing someone, and this makes it possible to introduce the child to the publicly shared meanings of those terms in application to human beings. But we cannot do anything analogous in the case of God. Even if the child can be aware of being spoken to or forgiven or comforted by God, the parent cannot tell when the child is aware of this unless the child tells the parent, which presupposes that the child already has learned how to apply the terms to God.

The second point is that creaturely terms cannot, in general, be used of God in exactly the same sense because of the ways in which God is different from creatures. There is no universal agreement as to just what these ways are, but some of those most commonly cited are as follows. God is infinite in power, knowledge and goodness; each of us is very limited in these respects. God is purely spiritual; we are embodied. God is omnipresent; we are severely restricted in spatial location. According to some theologies, God enjoys an atemporal mode of being - the simultaneous and complete possession of illimitable life; we live our lives successively, one moment at a time.

These differences have implications for what it is for God to be or do the various things we believe of him. God's knowledge is a very different thing from human knowledge. It is not built up by inference from the deliverances of perception. God has no sense organs, and no need to infer some truths from others. He knows everything directly. Since God is immaterial, divine overt action is a fundamentally different thing from human overt action. The only things we can effect directly are changes in our bodies; we bring about changes in the external world only by moving our bodies in certain ways. But God, having no body, will directly bring about changes in the world. Finally, if God's mode of being is atemporal, the picture will be still more different. Virtually every aspect of our activity is deeply imbued with temporality. We acquire information, think, deliberate and act by a temporal succession of stages.

This makes it clear that predicates cannot be truly applied to God in just the sense in which they apply to creatures. They cannot be used univocally of God and creatures. But that leaves several alternatives. They can be used metaphorically of God. That is very common in religious discourse. When we say 'His *hands* prepared the dry land' or 'The Lord is my *rock* and my *fortress*', the italicized terms are obviously used metaphorically. We do not think that God literally has hands or is a rock. And some people take all, or virtually all, theology to be metaphorical (see McFague 1982). But most theologians have supposed that we can make some literally true statements about God, and that it is important for the foundations of faith that we are able to do so. This has led them to explore other alternatives. A popular tack is that classically taken by Aquinas and developed in various ways by his successors. On this view, (some) creaturely terms are used analogically of God. There is an important analogy between their creaturely and theological import. According to Aquinas (§9), there is not even a partial univocity between 'know', for example, as applied to humans and God, even though there is enough analogy between their senses to enable us to understand what is said of God when he is said to know something. Aquinas' denial of partial univocity stems from his belief in a particularly radical divine-human difference, namely that God is absolutely simple. There is no difference of any sort between 'aspects' of the divine being. Since God is not different from any of his attributes or actions, no term as applied to God can mean even partly the same as to it does when applied to creatures (see Simplicity, divine §§1-2).

Contrary to Aquinas, there is a way in which, for some terms, there can be a partial overlap of meaning in the divine and human applications. The crucial point here is that the meaning of a term often includes more abstract, generic aspects and more concrete, specific ones. The term might carry over its more abstract meaning, though not

its more concrete meaning, from one application to another. This would make it possible for the more abstract component of the concept of knowledge to be common to God and humans, even though the way this is realized (and so the more concrete meaning of the term) would be different in the two cases. Consider an action term, such as ‘makes’. It seems reasonable to suppose that the full concrete meaning of this term, as it is used of human beings in saying ‘John made a bookcase’, includes ‘transforming some pre-existing material’ and ‘effecting this by moving his body in certain ways’. If so, that full meaning does not carry over to ‘God made the universe’, assuming that we mean this to involve creation *ex nihilo* and take God to be immaterial. But there could be a more abstract component of the meaning that is carried over, for example, ‘brings it about by one or more acts of will that a certain state of affairs obtains’. In this way, some parts of the creaturely meanings of some terms can be used literally to make statements about God that have a chance of being true.

Religious pluralism

Religion displays a luxuriant diversity of beliefs and practices. Crusades and colonialism, preaching and proselytizing, argument and apologetics have failed to produce worldwide agreement. In order to understand this situation, four possibilities are worth considering. The first is reductive naturalism. On this view, religious beliefs about a supernatural or transcendent dimension of existence are all false. They are to be explained as products of a merely human projection mechanism. The writings of such naturalistic philosophers and scientists as Feuerbach, Marx, Freud, and Durkheim suggest ways in which such projections might occur. A second possibility is exclusivism. Doctrinal exclusivism is the view that the doctrines of one religion are completely true; the doctrines of all others are false whenever there is conflict. Soteriological exclusivism is the view that only one religion offers an effective path to salvation or liberation. Though the two kinds of exclusivism are logically independent, they are usually held together. A third option, which has found increasing favour in the second half of the twentieth century, is inclusivism: one religion contains the final truth and others contain only approaches to or approximations of it; the privileged religion offers the most effective path to salvation, but those outside it can somehow be saved or liberated. The final option, pluralism, is a relative newcomer. According to pluralism, a single ultimate religious reality is being differently experienced and understood in all the major religious traditions; they all, as far as we can tell, offer equally effective paths to salvation or liberation.

These options raise interesting questions. What accounts for the growing popularity of inclusivism and pluralism? How are we to articulate pluralism? Does exclusivism remain a rational option in spite of what is known about the whole range of religious traditions? Is pluralism, once clearly stated, a rational option?

1 The emergence of inclusivism and pluralism

Many Westerners will best understand the emergence of inclusivism and pluralism in terms of the history of Christianity. For most of its history Christianity has been resolutely exclusivist. In late antiquity it was a new religion, struggling to establish itself in the face of criticism and persecution. It is not surprising to find it making exclusive claims on behalf of its charismatic founder, Jesus of Nazareth. Support for exclusivism was derived from sayings attributed to Jesus in scripture, such as ‘No one comes to the Father except through me’ (John 14: 6). By the third century many Christians held that there was no salvation outside their church (*extra ecclesiam, nulla salus*). During the Middle Ages, Christian Europe had little direct contact with the non-theistic religions of Asia. Islamic civilization was at the height of its powers and so posed a cultural and sometimes a military threat to Christian civilization. Jews were often despised and persecuted. To be sure, thinkers such as Thomas Aquinas managed to learn from Maimonides and Ibn Sina (Avicenna), but there were few opportunities for Christians, Muslims and Jews to interact on a footing of equality and develop mutual religious respect. And when in the modern era Christian Europe became the dominant world power, colonial expansion began and Christian missionaries, whose chief aim was conversion, spread over the face of the earth.

Of course, Christianity is not the only religion to have fostered exclusivist attitudes. In their more militant moments, Muslims have done the same. Some Jews cherish an ethnically exclusive identity as God’s chosen people, and some Hindus revere the Vedas as a source of absolute truth. Buddhists often see in the teachings of Guatama the only *dharma* that can liberate humans from illusion and suffering. Still, the exclusivist strain in Christianity has been unusually strong and persistent.

The turn away from exclusivism on the part of many but not all Christians in the latter half of the twentieth century is therefore a dramatic development. No doubt the full explanation of it will be complex, but it seems clear that at least the following three factors will figure in it. First, many Christians have learned tolerance for other religions. Christian denominations learned tolerance for one another in the aftermath of the Wars of Religion; Christianity is learning tolerance of other religions in the aftermath of colonialism and the Holocaust. In retrospect, many Christians have come to see in exclusivist attitudes both a source of complicity in the evils of colonialism and a stimulus for the anti-Semitism that contributed causally to the Holocaust. Second, many Christians have also come to understand (at least to some extent) other religions, a benefit often conferred on them by the modern academic study of religion. When one can read the important texts of other religious traditions in good translations with helpful commentaries, one can experience for oneself their power, nobility and allure. When one learns that the

beliefs of other religious traditions are supported by experiences and arguments similar to those that support the beliefs of one's own tradition, one is apt to acknowledge the epistemic rationality of the participants in other traditions. And one is likely to acknowledge their practical rationality once one comes to see that their traditions, judged by the fruits they yield, are comparable to one's own in helping people to live well and in producing saintly people.

The third and most important factor is the increasing frequency of intense and cooperative personal interaction among participants in diverse religious traditions. Exclusivist attitudes are under pressure in such contexts. Such interactions have played a major role in the careers of two of the leading pluralist thinkers, Wilfred Cantwell Smith and John Hick. Smith has written about the influence on his thought of having taught for some years at a small Christian college in Lahore in which the majority of the teaching staff and students were Hindus, Muslims or Sikhs (Smith 1963). He also organized and worked for several years in the Institute for Islamic Studies at McGill University, which is structured by the proviso that half the faculty and half the graduate students should be Muslims. Hick has written of the impression made on him by cooperating with Muslims, Jews, Hindus and Sikhs in campaigns for tolerance in Birmingham, England, during the 1960s (Hick 1993). As religious diversity increases within our societies, more and more Christians are involved in and being influenced by such personal interactions, and the influence in many cases has operated to undermine exclusivist attitudes.

If one moves away from exclusivism, the step to pluralism is larger than the step to inclusivism. Since the Second Vatican Council in the 1960s, inclusivists among Roman Catholic theologians have proposed that human salvation depends entirely on the sacrificial death of Christ, but that all humans can somehow be united with Christ and so share in his redemption. To pluralists, this view seems to be an unsatisfactory halfway house. If one is going to allow that people in religious traditions other than Christianity can be saved, it appears to be simpler and more natural to claim that their salvation is mediated by their traditions than to insist that it is mediated by Christ. Thinking that something more radical than inclusivism is called for, Smith, himself a Christian theologian, argues that it is an urgent task for us to work out a world theology or a theology of comparative religion. He suggests that such a theology would involve discourse about the transcendent dimension of human life and of the universe, to which the history of religion bears witness and which it elucidates (Smith 1981). However, this suggestion raises philosophical problems. According to Muslims, the transcendent dimension of the universe is a personal deity, Allah; according to Advaitic Hindus, it is an impersonal absolute, Brahman. These claims seem to be logical contraries. Hence it appears that any theology that takes a stand on the specific nature of the transcendent dimension of the universe will be unable to escape doctrinal exclusivism.

2 The pluralistic hypothesis

Appearances, however, can deceive. Hick has set forth a philosophically sophisticated pluralistic hypothesis that may avoid problems of this sort (1987, 1989). As he sees it, each of the major religious traditions offers a path to salvation or liberation that involves a transformation of human existence from self-centredness to reality-centredness. Judged by their results, all of these traditions are, as far as we can tell, of roughly equal effectiveness in producing this transformation. This suggests that a single ultimate reality is being differently conceived, experienced and responded to from within different traditions. Following Kant (§3), Hick develops the suggestion using the distinction between the phenomenal and the noumenal. His hypothesis is that the noumenal Real is experienced and conceived within different religious traditions as the range of gods and absolutes reported by the phenomenology of religion. Being phenomenal, such gods and absolutes are not illusory but are empirically real manifestations of the noumenal Real.

There are two ways of interpreting these claims. According to the first, the pluralistic hypothesis postulates a single noumenal Real and diverse ways in which it appears and is experienced within different religious traditions. On this interpretation, apparently conflicting claims about ultimate reality are to be understood as truths about how the noumenal Real appears to various groups, but as falsehoods about how it is in itself. It is not contradictory to suppose that the noumenal Real appears as and is experienced as personal by Muslims and impersonal by Advaitic Hindus. Moreover, if we assume that being personal and being impersonal are contraries rather than contradictories, it is consistent to suppose that the noumenal Real is in itself neither personal nor impersonal. On this view, the major religions will be on a par in two senses: they are all equally correct if their apparently conflicting claims are taken to be about the ways in which the noumenal Real appears to them, and they are all

equally mistaken if those claims are taken to be about the ways in which it is in itself.

According to the second interpretation, the pluralistic hypothesis postulates not only a single noumenal Real but also many phenomenal Reals that are joint products of the interaction of the noumenal Real and various human religious traditions. On this interpretation, apparently conflicting claims about ultimate reality are to be understood as truths about the attributes of the diverse phenomenal Reals of the various religious traditions, but falsehoods about the attributes of the noumenal Real. It is not contradictory to suppose that the phenomenal Real of Islam is personal, the distinct phenomenal Real of Advaitic Hinduism is impersonal, and the noumenal Real, which is yet a third thing, has neither of the contrary attributes of being personal and being impersonal. On this view, the major religions will also be on a par in two senses: they are all equally correct if their apparently conflicting claims are taken to be about the attributes of their diverse phenomenal Reals, and they are all equally mistaken if those claims are taken to be about the attributes of the noumenal Real.

It should be noted that, on either interpretation, Hick's pluralistic hypothesis purchases such parity at a high price. It is a rival to the main lines of self-understanding within the major religious traditions. Most members of such traditions would reject the claim that their beliefs are true only of ways in which ultimate reality appears to them, or of phenomenal objects it contributes to producing, and are not true of that reality as it is in itself. If they employed the distinction between the phenomenal and the noumenal, Muslims would be likely to insist that the noumenal Real is personal, and Advaitic Hindus would be likely to insist that it is impersonal. Hick can attribute only mythological truth to such claims, and he takes mythological truth to be nothing more than literal falsity plus a tendency to evoke appropriate dispositional attitudes. So Hick's version of pluralism attributes massive literal error to both Muslims and Advaitic Hindus. This is not surprising, because their traditions remain, for the most part, stoutly pre-Kantian in their self-understandings. Of course, Hick's pluralism attributes equally large literal error to all the other major religious traditions. Hence it will be unacceptable to most people who at this time participate in any of the major religions; such people will prefer to hang on to their doctrinal exclusivism. Is it rational for them to do so in the face of what is known about religious diversity?

3 The rationality of exclusivism

A positive answer to this question is contained in the religious epistemology of William P. Alston. He operates within a doxastic practice approach to epistemology. A doxastic practice is a way of forming beliefs and evaluating them epistemically in terms of a background system of beliefs that furnishes potential overriders. For example, forming beliefs on the basis of sense perception is a doxastic practice. Alston (1991) argues at length that it is practically rational to engage in socially established doxastic practices that are not demonstrably unreliable or otherwise unqualified for rational acceptance.

In the religious sphere, mystical perception is defined by Alston as religious experience in which a presentation or appearance to the subject of something the subject identifies as ultimate reality occurs (see Religious experience). As he sees it, there are different socially established mystical doxastic practices in the major religious traditions because there are substantial differences in their overrider systems of background beliefs. One such practice is Christian mystical practice. Alston argues that it is not demonstrably unreliable, and parallel arguments can be made for the mystical practices of other major religions. However, both the outputs of Christian mystical practice and its overrider system are massively inconsistent with their counterparts in the mystical practices of other religious traditions, and those mystical practices are in turn massively inconsistent with one another. Hence at most one of them can be a reliable way of forming beliefs about ultimate reality. But why should one suppose that Christian mystical practice is the one that is reliable if any is?

Of course, Christian mystical practice can come up with internal reasons for supposing that it is more reliable than its rivals. But each of them can do the same. Moreover, as Alston points out, Christian mystical practice enjoys significant self-support from the way in which promises it represents God as making are fulfilled in the spiritual lives of its practitioners. But each of its rivals enjoys similar self-support. Thus it seems that Christian mystical practice is disqualified for rational acceptance unless it can come up with sufficient independent reasons for supposing that it is reliable or, at least, more reliable than its rivals. By parity of reasoning, the same thing seems to be true of the mystical practices of other religious traditions.

Alston does not try to provide independent reasons for the reliability of Christian mystical practice, and he

acknowledges that its epistemic efficacy is weakened in the absence of such reasons. However, he denies that it is reduced to the point at which it is no longer qualified for rational acceptance, and supports this denial with an analogical argument. It proceeds by comparing the actual diversity of mystical perceptual practices and a hypothetical diversity of sensory perceptual practices. Suppose that in certain cultures there were a socially established Cartesian practice of seeing what is visually perceived as an indefinitely extended medium that is more or less concentrated at various points, rather than (as in our actual Aristotelian practice) as made up of more or less discrete objects scattered about in space. Further suppose that both these practices are equal in terms of the fruits they produce in terms of enabling their practitioners to deal successfully with their physical environment. Imagine also that in this scenario we are as firmly wedded to our Aristotelian practice as we are in fact, yet can find no independent reasons for supposing that it is more reliable than the rival Cartesian practice. According to Alston, in the absence of independent reasons for thinking that the Cartesian practice is more reliable than our own, the rational thing for us to do is to stick with our Aristotelian practice, of which we are masters and which serves us well in guiding our activity in the world. But the imagined situation is precisely parallel to our actual situation with respect to Christian mystical practice. Therefore, by analogy, the rational thing for those engaged in Christian mystical practice to do is to stick with it and continue to accept the Christian system of belief. Since that system of belief as currently constituted is exclusivist, it follows that it is rational for its adherents to remain Christian exclusivists. And, of course, by parity of reasoning, similar conclusions hold for those engaged in the mystical practices of other religious traditions. Leaving aside independent reasons for thinking that alternatives are more reliable than their own practices, the rational thing for them to do is also to stick with those practices and to accept their exclusivist systems of belief.

4 The rationality of pluralism

Even if it is granted that Alston has convincingly argued for the practical rationality of sticking with the exclusivist beliefs of one’s own mystical practice, the claim that this is the only rational thing to do can be challenged. To return to his analogy, sticking with our own Aristotelian practice and switching to the rival Cartesian practice are not the only options. We can also revise our Aristotelian practice from within and try to get the revised practice socially established. Revisions might proceed in a Kantian direction. Suppose it occurs to us that the success of both Aristotelian and Cartesian sensory perceptual practices in the imagined situation can be explained by the hypothesis that each is reliable with respect to the appearances things present to its practitioners, but neither is reliable with respect to how things are in themselves. Moved by this consideration, we decide to modify our perceptual practice so that it comes to map sensory inputs onto doxastic outputs about the appearances things present to us, but not about how things really are independent of us. Precedent for such modifications is found in the way people respond to learning that such things as phenomenal colours are not mind-independent. It seems that it would be rational to proceed in accordance with this scenario. In the imagined situation, then, it would be rational to stick with our Aristotelian practice, but it would also be rational to transform it into a Kantian practice.

The imagined situation is, of course, relevantly parallel to the actual situation with regard to competing mystical practices. Hence, by analogy, though it is rational for those engaging in Christian mystical practice to continue to do so, it is not the only rational thing to do, there being more than one thing it is rational to do in the face of competing mystical practices. Another such thing would be to modify Christian mystical practice from within to make it more Kantian. Each of these courses of action is rationally permissible in the light of religious diversity. Neither is irrational, but neither is rationally required. And setting aside any relevant dissimilarities, the lesson applies not only for those engaged in Christian mystical practice, but also for those engaged in other socially established mystical practices with significant self-support.

Renaissance philosophy

The term ‘Renaissance’ means rebirth, and was originally used to designate a rebirth of the arts and literature that began in mid-fourteenth century Italy (see Humanism, Renaissance). Here the term is simply used to refer to the period from 1400 to 1600, but there are ways in which Renaissance philosophy can be seen as a rebirth, for it encompasses the rediscovery of Plato and Neoplatonism (see Platonism, Renaissance), the revival of such ancient systems as Stoicism and scepticism (see Scepticism, Renaissance; Stoicism), and a renewed interest in magic and the occult. Continuity with the Middle Ages is equally important. Despite the attacks of humanists and Platonists, Aristotelianism predominated throughout the Renaissance, and many philosophers continued to work within the scholastic tradition (see Aristotelianism, Renaissance).

1 Historical and social factors

Three historical events were of particular importance. First is the Turkish advance, culminating in the capture of Constantinople in 1453. This advance produced a migration of Greek scholars (like George of Trebizond) and Greek texts into the Latin-speaking West (see Humanism, Renaissance §4; Platonism, Renaissance §3). It also led to a search for new trade routes. The European discovery of the Americas and the first voyages to China and Japan widened intellectual horizons through an awareness of new languages, religions and cultures (see Scepticism, Renaissance §2). New issues of colonialism, slavery and the rights of non-Christian peoples had an impact on legal and political philosophy (see Latin America, colonial thought in §1; Vitoria, F. de; Soto, D. de; Suárez, F.). The study of mathematics and science (especially astronomy) was also affected by developments in navigation, trade and banking, by new technology such as the telescope and other instruments (see Kepler, J.; Galilei, Galileo), as well as by the recovery of Greek mathematics and the favourable attitude of Plato towards mathematical studies (see Platonism, Renaissance §6).

Second is the development of printing in the mid-fifteenth century (see Humanism, Renaissance §6). This allowed for the publication of scholarly text editions, for the expansion of learning beyond the universities, and for the increased use of vernacular languages for written material (see Humanism, Renaissance §4). These changes particularly affected women, who were most often literate only in the vernacular. Christine de Pizan, Paracelsus, Ramus, Montaigne, Bruno and Charron are among those who used vernacular languages in at least some of their works.

Third is the Protestant reformation in the first part of the sixteenth century (see Luther, M.; Calvin, J.). Protestant insistence on Bible reading in the vernacular strengthened both the use of the vernacular and the spread of literacy (see Melanchthon, P. §1). The Catholic Counter-Reformation also affected education, particularly through the work of the Jesuit Order (founded 1540), which set up educational institutions throughout Europe, including the Collegio Romano in Rome (founded 1553) and the secondary school at La Flèche, where Descartes was educated (for further examples, see Collegium Conimbricense; Aristotelianism in the 17th century §2). Political philosophy took new directions (see Hooker, R., for example) and theological studies changed. As the Protestants abandoned the *Sentences* of Peter Lombard and emphasized the church fathers, so the Catholics replaced the *Sentences* with the *Summa theologiae* of Thomas Aquinas. In turn, these changes affected the undergraduate curriculum, which (for other reasons as well) became less technically demanding, especially in relation to logic studies (see Logic, Renaissance). Personal liberties, too, were affected. Both Catholics and Protestants censored undesirable views, and the first Roman Catholic Index of Prohibited Books was drawn up in 1559. Bruno was burnt for heresy, and Campanella was imprisoned. Calls for tolerance by such men as Montaigne and Lipsius were not always favourably received. The books of all these men, and others such as Erasmus, Machiavelli and Rabelais, were placed on the Index or required to be revised. At the same time, Calvinist Geneva prohibited the printing of Thomas Aquinas and Rabelais.

Social factors also affected philosophy which, as an academic discipline, was tied to the universities. These continued to accept only male students, and to teach in Latin, the universal language of learning and of the Roman Catholic Church, but more students came from higher social classes than during the Middle Ages. They expected a curriculum with less emphasis on technical logic and natural science and more on rhetoric, modern languages, history and other practical disciplines. Such curricular changes owed much to humanism, as did the spread of new

secondary schools (see Humanism, Renaissance §7; Montaigne, M. de §1).

The Renaissance was also notable for the spread of learning outside the university. Some men largely relied on the patronage of nobles, princes and popes (among them Valla, Ficino, Pico della Mirandola and Erasmus), some were medical practitioners (including Paracelsus and Cardano), some had private resources (like Montaigne). Nor was it only men that were involved: Christine de Pizan, for example, was a court poet.

2 Humanism and the recovery of ancient texts

Humanism was primarily a cultural and educational programme (see Humanism, Renaissance; Petrarca, F.; Agricola, R.; Erasmus, D.; Vives, J.L.; Rabelais, F.). Humanists were very much concerned with classical scholarship, especially the study of Greek, and with the imitation of classical models. Despite their frequent criticisms of scholastic jargon and techniques, they were not direct rivals of scholastic philosophers, except in so far as changes to the university curriculum brought about by the influence of humanist ideals diluted or squeezed out scholastic subjects. It was humanism that led to the rediscovery of classical texts, and their dissemination in printed form, in Greek and in Latin translation. Plato is the most notable example, but he was rediscovered with the Neoplatonists, and was often read through Neoplatonic eyes (see Ficino, M.; Platonism, Renaissance §1). The so-called ancient wisdom of Hermeticism (also known as Hermetism) was also recaptured within a Neoplatonic framework (see Ficino, M. §2; Patrizi da Cherso, F.), and, along with the Kabbalah (see Kabbalah), led to a revived interest in magic and the occult (see Alchemy §5; Agrippa von Nettesheim, H.C.; Bruno, G.; Paracelsus). These streams also fed into the new vitalistic philosophy of nature (in such thinkers as Paracelsus, Bruno, Campanella, Cardano and Telesio). Other ancient schools of thought that were revived include Epicureanism (see Valla, L. §2), scepticism (see Agrippa von Nettesheim, H.C.; Erasmus, D. §4; Sanches, F.; Montaigne, M. de; Charron, P.) and Stoicism (see Lipsius, J.).

Some humanists wrote important works on education, including the education of women (see Erasmus, D. §2; Vives, J.L. §§1, 4). The Lutheran Aristotelian Melanchthon was also an educational reformer; and the Jesuits drew up the *Ratio Studiorum* (Plan of Studies) which prescribed texts for all Jesuit institutions (see Collegium Conimbricense; Fonseca, P. da §1). Humanism also affected Bible studies (see Erasmus, D. §1; Luther, M. §3; Humanism, Renaissance §6) and Aristotelianism itself (see Aristotelianism, Renaissance §1).

3 Scholasticism and Aristotle

Scholastic philosophy was the philosophy of the schools, the philosophy which was taught in institutions of higher learning, whether the secular universities or the institutions of religious orders. The association of late scholastic philosophy with institutions of higher learning carried with it a certain method of presentation, one which is both highly organized and argumentative, with a clear account of views for and against a given thesis. It also carried with it a focus on Aristotle, for it was Aristotle who provided most of the basic textbooks in the sixteenth- and even the seventeenth-century university. Nor was the study of Aristotle necessarily carried on in a rigidly traditional manner, for many different Aristotelianisms were developed (see Aristotelianism, Renaissance). Moreover, particularly within the Jesuit order, there was a strong inclination to include new developments in mathematics and astronomy within the framework of Aristotelian natural philosophy (see Aristotelianism in the 17th century §1).

Aristotelians include Paul of Venice, George of Trebizond, Vernia, Nifo, Pomponazzi, Melanchthon, Zabarella and the Thomists (see below). Anti-Aristotelians include Petrarch (see Petrarca, F.), Blasius of Parma, Valla, Ramus, Sanches, Telesio, Patrizi da Cherso and Campanella. Some philosophers sought to reconcile Platonism and Aristotelianism (see Pico della Mirandola, G. §4; Platonism, Renaissance §§3, 6).

A very important characteristic of late scholastic philosophy is its use of medieval terminology, along with its continued, explicit, concern both with problems stemming from medieval philosophy and with medieval philosophers themselves. There are fashions here as elsewhere. Albertism (the philosophy of Albert the Great) was important in the fifteenth century (see Aristotelianism, medieval §5); nominalism more or less disappeared after a final flowering in the early sixteenth-century (see Biel, G.; Major, J.). Scotism declined significantly, but was still present in the seventeenth century (see Aristotelianism in the 17th century §§2-4; Latin America, colonial thought in §2). Thomism underwent a strong revival especially through the work of the Dominicans (Capreolus, Cajetan,

Silvestri, Vitoria, Soto, Báñez and John of St Thomas) and the Jesuits (Fonseca, Toletus, Suárez and Rubio: see Latin America, colonial thought in §§2, 5).

4 Philosophical themes

It is difficult to map the interests of Renaissance philosophers on to the interests of contemporary philosophers, especially as the main form of writing remained the commentary, whether on Aristotle or Aquinas. Suárez is the first well-known author to write a major systematic work of metaphysics that is not a commentary, though earlier authors (such as Nifo and Pomponazzi) had written shorter works on particular themes. Nonetheless, certain general themes can be isolated:

4.1 Logic and language. Logic was basic to the curriculum of all educational institutions, and many Renaissance philosophers wrote on logic (see Logic, Renaissance; Language, Renaissance philosophy of; Aristotelianism, Renaissance §2; Logic in the 17th and 18th centuries §§1-2). Individual humanists who worked in this field include Valla (§4), Agricola, Vives; Melanchthon (§2) and Ramus (§2); individual scholastics include Soto (§2), Toletus and Fonseca (§2). Theories of logic and language were often closely related to metaphysics and philosophy of mind, as well as to science.

4.2 Metaphysics and philosophy of mind. Among the themes that overlapped with theories of logic and language were: (i) mental language (see Language, Renaissance philosophy of §2; Language, medieval philosophy of §2; see also Language of thought); (ii) analogy (see Language, Renaissance philosophy of §4; Capreolus, J.; Cajetan §2; Silvestri, F.; Fonseca, P. da §3); (iii) objective and formal concepts (see Capreolus, J.; Fonseca, P. da §3; Suárez, F. §2; Language, Renaissance philosophy of §4); (iv) beings of reason (see Language, Renaissance philosophy of §3; Fonseca, P. da §3; John of St Thomas §4). A specifically Thomistic theme in metaphysics was the relation between essence and existence (see Aquinas, T. §9; Cajetan §5; Fonseca, P. da §3; Báñez, D.; Suárez, F. §2). Other metaphysical issues include: (i) universals (see Paul of Venice; Biel, G. §4; Suárez, F. §2); (ii) individuation (see Capreolus, J.; Cajetan §3; Suárez, F. §2); and (iii) the Great Chain of Being (see Paul of Venice; Ficino, M. §3; Pomponazzi, P. §4; Bruno, G. §5; Aristotelianism, Renaissance §6). Issues in the philosophy of mind included the existence of an agent sense (see Blasius of Parma §3; Nifo, A. §3; Aristotelianism, Renaissance §4) and of intelligible species (Cajetan §4; Nifo, A. §3; Toletus, F. §5; Aristotelianism, Renaissance §4).

4.3 Immortality. The biggest single issue was the nature of the intellectual soul, whether it was immortal, and if so, whether its immortality could be proved (see Paul of Venice; Blasius of Parma §2; Ficino, M. §3; Cajetan §4; Silvestri, F.; Pomponazzi, P. §2; Nifo, A. §3; Toletus, F. §5; Suárez, F. §3; John of St Thomas §3; Aristotelianism, Renaissance §5; see also Soul, nature and immortality of the).

4.4 Free will. Free will was a topic closely connected with the religious issues of grace, predestination and God's foreknowledge (see Valla, L. §3; Biel, G. §3; Pomponazzi, P. §4; Luther, M. §3; Erasmus, D. §1; Calvin, J. §4; Molina, L. de; Molinism; Báñez, D.; Providence §3).

4.5 Science and philosophy of nature. The discussion of scientific method also overlaps with logic (see Logic, Renaissance §7; Aristotelianism, Renaissance §2; Vernia, N. §2; Zabarella, J. §§4-5; Latin America, colonial thought in §5). Themes include (i) traditional Aristotelian discussions about the object of natural philosophy (see Aristotelianism, Renaissance §3; Vernia, N. §3; Zabarella, J. §6, John of St Thomas §3); (ii) Anti-Aristotelian materialism (see Blasius of Parma); (iii) the new philosophies of nature which saw the universe as full of life (see Paracelsus; Bruno, G.; Campanella, T.; Cardano, G.; Telesio, B.) or as explicable in terms of light-metaphysics (see Patrizi da Cherso, F.); (iv) tentative approaches to empiricism (see Vives, J.L. §4; Ramus, P. §4; Sanches, F. §3). Finally, there are the thinkers who set science on a new path by using a combination of mathematical description and experiment (such as Copernicus, Kepler and Galileo).

4.6 Moral and political philosophy. Humanists were deeply concerned with moral and political philosophy (see Humanism, Renaissance §2; Erasmus, D. §3; Vives, J.L. §2), as were Protestant reformers (see Melanchthon, P. §3; Calvin, J. §5). Although the central focus remained on Aristotle (see Aristotelianism, Renaissance §7), Epicurean moral philosophy was taken up by Valla and Stoic moral philosophy was also influential (see Lipsius, J.; Charron, P. §3). Major political thinkers included Machiavelli, Vitoria and Bodin. Many discussions of forms of government, the status of law, and the notion of a just war grew out of the Aristotelian-Thomistic tradition - prominent contributors to this tradition include Christine de Pizan, Vitoria, Soto (§4), Toletus (§2), Suárez (§4),

Molina (§4) and Hooker (see also Latin America, colonial thought in §1). Other significant types of Renaissance political philosophy include: (i) conciliarism (see Ailly, P. d'; Gerson, J.; Nicholas of Cusa; Major, J. §3); (ii) utopianism (see Utopianism; Rabelais, F. §2; Campanella, T. §3); (iii) Neostoicism (see Lipsius, J.). (See also Political philosophy, history of; Religion and political philosophy; Natural law.)

4.7 The human being. Themes related to the human being that were prominent in the Renaissance include: (i) the distinction between microcosm and macrocosm (Nicholas of Cusa; Pico della Mirandola, G. §2; Paracelsus §2; Campanella, T. §2); (ii) love (Ficino, M. §4; Pico della Mirandola, G. §2); (iii) the ability to shape one's own nature (Pico della Mirandola, G. §3; Pomponazzi, P. §4).

E.J. ASHWORTH

Renner, Karl (1870-1950)

Karl Renner was a leading contributor to democratic-socialist legal theory within the Neo-Kantian 'Austro-Marxist' interpretation of socialism that developed in late nineteenth-century Vienna. For Renner and his associates, law is a fundamental and universal institution in any ordered human society. Given the universal necessity of law, the development of socialism may well proceed in an evolutionary rather than a revolutionary manner - and certainly, within the context of Viennese social democracy, it would proceed better by evolution.

A view of Soviet Marxism is expressed by such as E.B. Pashukanis, for whom law in its full bourgeois development is simply the commodity structure reflected, while the juridical subject is an ideological representation of *homo economicus*. Law can neither contribute to nor survive the revolution. By contrast, Renner analyses human society in terms of three universal 'orders': the orders of power, of labour and of goods. Without power-relations, he holds, there can be no order in society; without social labour, there can be no material means for survival; goods for use and consumption are the product of labour and a necessity for social existence. So Marx's analysis of capitalist society can be recast in terms of the subordination of power and labour to property: the order of goods dominates the order of power and the order of labour. Any transformation in fundamental social forms will be expressed through a reshaping of the three orders (see Social theory and law §3).

Though it may seem paradoxical, the institutions of private law, at the level of their formal constitutive and regulative rules, persist in a superficially unchanged way through economic and societal change. The slave-owner, the subsistence farmer, and the joint-stock company of different epochs and modes of production enjoy property rights expressible in substantially unchanging juridical terms. But the institution's function in society will be transformed by shifts in the three orders. This in turn is reflected in development of 'complementary institutions', earlier of private law, later of labour law, welfare law, and planning law. The development through public law of institutions that subordinate the order of goods to those of labour and power is the evolutionary route to socialism.

As well as contributing significantly to legal theory, Renner played a large and important part in Austrian public life, with the obvious exception of the years 1934-45. One of the founding fathers of the Austrian republican constitution in 1919, he was first Chancellor of the Republic in 1919, and remained active in law and legal politics until the troubled thirties. After 1945, he became briefly Chancellor of the restored Republic, and was subsequently its President till his death in 1950. At the end of the twentieth century, his work is in something of an eclipse; but it remains worthy of attention as an attempt to state a democratic-socialist conception of law outside the sphere of the socio-legal ideas discredited in the revolutions of 1989.

Sugarman (ed.), *Legality, Ideology and the State*, London: Academic Press, 11-42.(A very clear account of Renner's theory, setting it properly in the context of the debate between Austro-Marxism and Soviet Marxism, and explaining the 'three orders' briefly sketched in the present article.)

Renouvier, Charles Bernard (1815-1903)

Charles Renouvier is the main representative of French Neo-Kantianism in the nineteenth century. Following Kant, he delimited the conditions for the legitimate exercise of the faculty of knowledge, and denounced the illusions of past metaphysics. Wishing to go further than Kant in this direction, he criticized the notions of substance and of actual infinity. According to him, relation is the basis of all our representations, reality is finite, and certainty rests on liberty. In ethics, he took into consideration, beyond the ideal of duty, the existence of the desires and interests to which history testifies.

Renouvier became known shortly after leaving the École polytechnique through an academic treatise on Cartesianism. His first philosophy, known as 'the philosophy of manuals', is marked by the attempt to reconcile contradictories in being and by republicanism in political thought.

The discovery of contradictions of the actual infinite led to the real system of 'neo-criticism', a doctrine combining phenomenalism, finitism and apriorism. Neo-criticism rests on the principle of relativity: our knowledge is restricted to things as they appear to us, as they enter into our representations, which are subject to the laws that govern our experience a priori. Thus things of which we have no representation do not exist, or are as nothing to us. Agreeing with Auguste Comte, Renouvier substitutes the investigation into phenomena and laws for the investigation into essences. He formulates the 'principle of number', according to which everything given is numbered, and shows that space, time, matter and movement could not be posited in themselves without implying the contradictory notion of an actual infinity of parts. He undertakes to destabilize metaphysics, which he calls an 'idolology', by refuting its illusions or 'idols' (the Absolute, the Substance, the Infinite, pure Oneness, pure Being) and to refine the Kantian system, in which he perceives a remnant of the substantialism of pre-critical philosophy. His criticisms are many: Kant makes the mistake of identifying the real with the unknowable thing in itself, and of relegating liberty to the noumenal sphere; sensibility is not a separate faculty from the understanding; relation is the principle law of representation, which underlies all the other categories (number, position, succession, quality, becoming, causality, finality, personality); the enumeration of these categories is not justifiable, but they must be simply submitted to the verification of each person; finally, the system of antinomies juxtaposes theses of unequal value, as the antitheses are contradictory in themselves, while the theses are simply incomprehensible.

The affirmation of liberty marks the transition from theoretical to practical reason. Following his friend Jules Lequier, Renouvier maintains that liberty is the basis of certainty. The scope of evidence is limited to the perception of actual phenomena. Certainty rests on belief, and belief on liberty. Our affirmations are governed, at bottom, by free acts. Thus the existence of external things, pushed back beyond the limits of knowledge, is rehabilitated in the field of belief. Opposed to the doctrine of 'inevitable progress', Renouvier proposes an 'analytic' philosophy of history, proceeding from complex data to elementary facts, without claiming that these facts could not be combined in another way, and explaining rise and decline in history through the free actions of individuals and societies. He proposes on the other hand a 'science of ethics', comprising a pure morality, with the notions of justice and obligation or the categorical imperative, and an applied morality, understood as a collection of principles inspired by pure morality, but taking into account the interests and desires revealed by experience and history. Renouvier considered that morality, like mathematics, must be based on pure concepts, but by confronting the ideal and the real, the state of peace and the state of war, and in formulating a right distinct from pure rationality and adapted to real humanity, he escapes from formalism, and constructs a morality that deals with concrete questions, such as marriage, property, taxation, universal suffrage and the death penalty.

Renouvier's final philosophy of 'personalism' is characterized by a metaphysics inspired by Leibniz and by new postulates concerning the divine and the origin of evil. Being, that is not in itself, *is* nevertheless, as it is representation for itself; it is composed of monads, defined by the functions of spontaneous activity, perception and appetition. Man, in so far as he is disposed towards a reflective consciousness and freedom, is a person. God is a person also, but the first and creator of the universe, understood in reference to the world and to our consciousness, which constitute the sole data by which we can formulate the idea of him, through acts of induction and generalizations. By admitting the fact of a first cause, Renouvier avoided the thesis, which to him was contradictory, of the infinite regress of phenomena; he recognized that it was a question of a limit for

understanding, but notes that the beginning of a series of phenomena due to our will is no less incomprehensible. In this period, Renouvier applied himself to summarizing the conflict of philosophical doctrines in the form of dilemmas, and opposed, on each subject, the 'doctrine of consciousness' to the 'doctrine of things'. The postulate required by practical reason to account for the existence of evil leads to an astonishing cosmogony: primitive humanity, a happy society instituted in a perfect natural order, was taken to collapse due to the effects of self-love and injustice; once the harmony of cosmic forces and human ends was corrupted, the whole was doomed to break up, forming the nebula, which is the probable origin of the present world.

Representation, political

Political representation - the designation of a small group of politically active citizens to serve as representatives of the political community as a whole - is a central feature of contemporary states, especially of those that claim to be democratic. But what does it mean to say that one person or one group of people represents a larger group? Representatives are sometimes understood as agents of those they represent, sometimes symbolizing them, sometimes typifying their distinctive qualities or attitudes. Although political representation has something in common with each of these, it has its own special character. The missing idea here may be that the group represented authorizes *the representative to make decisions on its behalf. This still leaves open one crucial question, however: how far should political representatives remain answerable to those they represent, and how far should they have the freedom to act on their own judgment?*

1 The concept of representation

In what sense or senses (if any) can one person represent another? Apart from the philosophical problems involved, there is also a problem about the political relevance of any of the senses identified. This may be brought out by considering the approach of Anthony Birch. In three books, Birch has analysed the notion of representation and its political application. He identifies three senses of ‘representation’, in relation to the general issue of how one person may be thought to represent another. The first is manifest in the relationship between a principal and an agent. For example, a person may employ others, such as lawyers and accountants, to act on their behalf with respect to a particular facet of their affairs. The second is when one person (or sometimes an institution or even an item like a flag) may be thought of as representing persons in a symbolic sense. A flag may be seen as a symbol of a nation; or a sports team may be regarded as representing the country for which it competes. Third, a person may represent others by being in some way typical of them. A jury may represent a wider community because it reflects in some way the composition of the general public. Birch, however, holds that none of these three logically distinct senses of what it is to be a ‘representative’ is a good guide to the meaning of the term applied in a political setting. This consideration reverts to the question of ‘political relevance’.

On the face of it, it is not difficult to provide political analogies to Birch’s three senses of representation. A person who votes for a candidate in an election might be thought to empower that person to act on their behalf, reproducing the relationship between principal and agent. Just as persons might arrange for their affairs to be dealt with by an accountant or lawyer, so they might pass the expression of their political concerns to someone for whom they vote. Again, symbolic representation seems to have a clear application with respect to heads of state: a monarch or a president may be thought of as representing the nation (or state) of which they are the titular head. Finally, a political representative may have characteristics, such as class, domicile, attitude and policy preference, which are shared with those persons represented.

Nevertheless, Birch maintains that these three senses of representation do not capture the meaning of political representation. He claims that there is a fourth sense of representation, applied to members of a representative assembly, ‘because they have been appointed by a particular process of election to occupy that role’, which authorizes them to ‘exercise certain powers’ (1993: 74).

2 Representation, election and authorization

This perspective introduces two important considerations: the relation between representation and election, and the relation between authorization and representation.

Despite the historical importance of arguments about the role of elections in a system of representation, there is no straightforward logical connection between election and representation. This is clear from a review of the three central understandings of ‘representation’ identified above. In the relation between a principal and an agent, in the usual case, an agent is selected rather than elected. This is because one person is choosing another to pursue their interests or to look after their affairs. The powers that each has as a result of their agreement are primarily a matter of the contract between them. For example, someone might allow a lawyer to pursue a case for them as the lawyer saw fit; but another individual might reserve judgment on the suggestions made by the lawyer and thus make any ‘final’ decisions. The amount of discretion enjoyed by an agent varies according to the agreement with the

principal.

In political terms, there is a distinction between a representative conceived of as a delegate and a representative conceived less narrowly. Delegates are bound by a prior decision of those for whom they speak; a delegate is to carry out the wishes, already determined, of the principals. The distinction was explored by Edmund Burke in his famous speech in Bristol in 1774. He contrasted the role of the representative, who uses his best judgment about the issue in hand, with the role of the delegate, who was expected to carry out the instructions of those who had chosen him, whatever the 'delegate's' own opinion. The 'political relevance' of this notion of representation depends on the space for negotiation between principal and agent. While it is true that a representative might be thought of as an agent, nothing much follows about the relative powers of the parties until the relation between them is understood. On the one side, the representative could be seen as having *carte blanche*; on the other, as having no role other than to register the decisions of those represented. Clearly, the understanding of this relation will impinge on how the representative is selected. If the representative is a delegate, then the delegate might be chosen at random. If the representative is expected to use judgment, then a procedure enabling those represented to register their acceptance of that potential for judgment, such as election, might seem more appropriate. Some specifications of the principal-agent relation will support the appropriateness of election; others will not.

Symbolic representation is connected with elections in an even more contingent manner. Many political systems have an elected head of state, but these systems vary widely in the amount of executive power which that head enjoys. On the other hand, many political systems have non-elected heads of state: for example, a hereditary monarch. Whatever powers are enjoyed, and irrespective of election, the head of state's claim to represent the nation as a whole, symbolically, can be advanced.

The last notion of representation - as related to typicality - is obviously the one which allows the greatest space for political argument; chiefly, disputes about the political relevance of the representative's various characteristics, on the one side, and the political relevance of various distinctions between those represented on the other. For example, recent feminist arguments have advocated the importance of quotas to ensure that allegedly relevant distinctions are properly reproduced in the representative body. The contingency of the connection between election and representation is also clear: in any election, the individual voter may aim not to support a candidate who possesses similar characteristics to the elector.

3 The limits of representation

The question arises, therefore, as to whether Birch is correct in claiming that none of the three understandings of representation helps in giving meaning to political representation. As we have seen, it is possible to produce political examples of the three general interpretations; on the other hand, there are limits as to how far such examples illuminate the special circumstances of politics. Birch's preferred solution is to rely on the idea that electors authorize their representatives to exercise particular powers. This is to tie the theory of representation to a particular theory of representative democracy, which has been historically contested (see Democracy).

The concept of authorization can indeed illuminate some difficulties. For example, the election of a pope may be seen as authorizing his role in the apostolic succession, thereby legitimizing his claim to the papacy. There is nevertheless considerable scope for political argument about the nature of authorization: when, and in what circumstances, may it be withdrawn? Which voting system is best equipped to sustain claims that those who are successful have been authorized (or have a mandate)? Representative government has been promoted as a political system solving many problems: for James Mill, that of harnessing the interests of the governed to those of the decision makers; for J.S. Mill (1861), that of balancing expertise with participation; for the Founding Fathers of the American Republic, that of balancing virtue with improving popular sentiment, or perhaps, again, restraining power. Rousseau (§§2-3) objected to political representation because the general will of the people (which was the proper source of legislation) could not be represented. Whatever the (no doubt considerable) merits of representative government, there are likely to be tensions between any government's claim to representativeness and the policy preferences of those they claim to represent.

Reprobation

Reprobation is an eternal decision by God that results in everlasting death and punishment for some persons. The doctrine of reprobation typically takes one of three forms: (1) that God from eternity decreed to elect some without regard to faith or works and to reprobate others without regard to sin or unbelief, both to display his glory and for reasons we do not know (sometimes called double predestination); (2) that God from eternity decreed to elect some, despite their sin, and to abandon the rest, with the cause of their reprobation being sin and unbelief; or (3) that God from eternity elected those he foreknew would believe in Christ and reprobated those he foreknew would persist in sin and unbelief.

Reprobation doctrine was developed by Augustine and appears in the theology of Thomas Aquinas, Martin Luther and John Calvin, who were deeply indebted to Augustine's thought. Although some Lutheran and Roman Catholic theologians have defended reprobation doctrine since the sixteenth century, Reformed theologians have stressed it and made it the occasion of controversy.

1 Predestination, election and reprobation

Reprobation is closely linked to election and predestination. Election is an eternal divine decision to choose some people to be the recipients of special saving grace. Sometimes the term predestination is synonymous with election, and sometimes it encompasses both election and reprobation.

Since the Middle Ages, many theologians have identified two aspects of reprobation. Negative reprobation, or preterition, is God's decision to 'pass by', or withhold saving grace from, certain individuals, thereby permitting them to sin, to reject the gospel, and to undergo eternal punishment for their sin and unbelief. Positive reprobation is the divine decision or will to punish eternally those who sin and do not receive saving grace.

The doctrine of reprobation is rooted in the Bible's statements that God loved Jacob and hated Esau 'even before they had been born or had done anything good or bad' (Malachi 1: 2-3; Romans 9: 10-13), that God hardened Pharaoh's heart (Exodus 4: 21, 7: 3, 9: 12, 10: 27, 11: 10; Romans 9: 14-18), and that God, who is like a potter working with clay, has the right to make some individuals for destruction in order to demonstrate his wrath, power and glory (Romans 9: 19-24). The most troublesome biblical text for reprobation doctrine is the statement that God 'desires everyone to be saved and to come to knowledge of the truth' (1 Timothy 2: 4).

2 Augustine and the Middle Ages

In opposition to Pelagian teachings that God gives grace to some and punishes others according to their merits, Augustine of Hippo affirmed the existence of an eternal divine decision, not based on merit, to give faith and eternal life to some but not to others (see Augustine §§6, 10, 13). Predestination is God's preparation of kindnesses that certainly deliver the elect, while the rest are denied the means of believing and left to God's righteous judgment upon their sin.

Recognizing that speaking of some who are foreordained to damnation might make God seem unjust, Augustine argued that reprobation is deserved, while election in Christ occurs by grace, not by merit. Even if no human being had been redeemed, God's justice would have been untarnished. Moreover, by showing what the whole race deserved, the everlasting punishment of the reprobate impresses upon the elect the benefits they have received by grace. Basing his argument on the parable of the labourers in the vineyard (Matthew 20: 1-16), Augustine said that God is not unjust if he is just towards some and benevolent towards others. Still, God's ways are past finding out, and Augustine cannot say why God mercifully chooses one person and abandons another in his justice even though both could have been saved if God had so willed it. Nevertheless, the will of the omnipotent God is never evil, and is never defeated, 'because even when it inflicts evil it is just, and what is just is certainly not evil' (*Enchiridion*, 102). By interpreting the biblical statement that God desires all people to be saved to mean that God desires every *sort* of person to be saved, Augustine avoided saying that 'the omnipotent God has willed anything to be done which was not done' (*Enchiridion*, 103).

In the ninth century, Gottschalk of Orbais (*c*.804-69), who defended double predestination (the doctrine that God from eternity decreed to elect some without regard to faith or works and to reprobate others without regard to sin

or unbelief), was condemned by the council of Mainz (848) and by the first and second councils of Quiercy (849 and 853), which held that God predestines certain individuals to life only. The decisions of these councils were repudiated by the council of Valence (855), which upheld the notion of double predestination.

Thomas Aquinas said that God predestines some to eternal life through his providence, and reprobates others by *permitting* them to fall into sin and suffer its consequence. Reprobation is more than simply knowing that a person will sin and not reach eternal life; it also includes God’s *will* ‘to permit a person to fall into sin, and to impose the punishment of damnation on account of that sin’ (*Summa theologiae* Ia, q.23, a.3). So predestination (or election) causes both saving grace and eternal salvation, whereas reprobation causes abandonment by God and future eternal punishment, but not sin in the present life. Still, God’s will alone determines which individuals are elect and which are reprobate.

Aquinas responded to the objection that God is unjust because he treats equals unequally, electing some and reprobating others. First, God can justly deny something to someone to whom it is not owed. Since all are equally undeserving of salvation, God is free to give grace to one person but not to another. Second, God elects some and reprobates others, not on the basis of foreknowing their good and evil actions, but to display his goodness, which is one and undivided in himself, but must be manifested in many ways in creatures. God manifests his goodness by mercifully sparing the elect and justly punishing the reprobate.

Rejecting Aquinas’ position, Henry of Ghent argued that God elects those he foreknows will accept grace freely and reprobates those he foreknows will not. John Duns Scotus, drawing his doctrine of election from Aquinas and his doctrine of reprobation from Henry of Ghent, held that God eternally wills salvation for the elect apart from divine foreknowledge, but eternally wills damnation for the reprobate only on the basis of foreseeing their sin. William of Ockham (§10) came close to Henry of Ghent’s view of reprobation, although his view that there are no standards of justice independent of God’s policies led him to hold that God’s free choice determined that obedience leads to eternal life while ultimate and unrepentant sinning results in eternal punishment.

Thomas Bradwardine (§3) revived the notion of double predestination, saying that reprobation is a sovereign act of God’s will and is not based on foreknowledge of sin. In response to the objection that it would be unjust for God to predestine anyone to damnation apart from foreknown guilt, Bradwardine argued both that the reprobate serve the purpose of leading the elect to flee from sin and choose the good and that, since God’s will alone is the righteous law for all creation, no creaturely lump of clay can dispute the divine potter’s actions.

3 The Reformation and post-Reformation period

Martin Luther taught that God predestines some individuals to salvation and others to damnation. In his treatise The Bondage of the Will, Luther based his view on statements in Romans 9 that God loved Jacob and hated Esau prior to their birth and apart from any merits or demerits of their free actions, and also that the clay has no right to question the actions of the potter. He attacked human reason for holding that God, in order to qualify as good, ‘may damn none but those who in our judgment have deserved it’. Even if God should send all people to perdition, says Luther, he is nevertheless good. Still, God’s hardening or working evil in people does not involve ‘creating evil in us from scratch’ ([1525] 1972: 178). Rather, God allows a person’s evil will to proceed according to its own bent and confronts the person with words and actions with which this evil bent will clash. Departing from Luther’s view of unconditional reprobation, the Lutheran Formula of Concord (1577) says that predestination causes the salvation of the elect, whereas the non-elect perish because of their own sinfulness, not because of God’s will or foreordination.

John Calvin (§4) held that God, on the basis of his will alone and not on the basis of foreknown holiness or sinfulness, foreordains eternal life for some and eternal damnation for others. God’s sovereign election of some and reprobation of others reveals his glory by showing his justice as well as by impressing upon the elect God’s infinite mercy to them.

The Roman Catholic Council of Trent (1545-63) responded to Protestants’ renewed emphasis on election and reprobation by anathematizing anyone who says that the grace of justification extends only to those who are predestined to life and that others who are called do not receive grace because they are by divine power predestined to evil.

In the seventeenth century, a dispute arose in the Reformed churches, sparked by Jacob Arminius (1559-1609) and his followers, the Remonstrants. Arguing against the view of Calvin and others that God reprobates without giving any consideration to sin and unbelief, the Remonstrants held that God elects those he foreknows will respond to grace and reprobates those he foreknows to be unrepentant unbelievers. In response, the Reformed Synod of Dort (1618-19) declared that God's eternal decision is the reason he softens the hearts of some, giving them the gift of faith, and leaves others 'in their wickedness and hardness of heart' (*Canons*, I, art. 6). Election to salvation is based not on foreseen faith, but exclusively in God's good pleasure in adopting as his own certain persons 'from among the common mass of sinners' (*Canons*, I, arts 9-10). Reprobation, according to Dort, is God's free and irreproachable decision not to grant 'saving faith and the grace of conversion' to some, but rather to leave them in the misery into which, 'by their own fault, they have plunged themselves'; and finally to condemn and eternally punish them for their sin and unbelief 'in order to display his justice' (*Canons*, I, art. 15). By reflecting the medieval distinction between negative and positive reprobation, Dort followed a more moderate line than Calvin on the doctrine of reprobation. Dort defended God's justice by arguing that God would have done no one an injustice if he had condemned the entire human race on account of their sin and also by pointing out, on the basis of Romans 9: 20, that we human beings have no place finding fault with God.

4 The twentieth century

Karl Barth emphasized and recast the doctrines of election and reprobation. For Barth, Jesus Christ is both the elect one in whom all humanity is elect and the reprobate or rejected one. Arguing that morality disallows ascribing to God a justice that would lead to the reprobation or rejection of individuals, Barth said that God in love from eternity transfers to Jesus Christ his rejection of and wrath against all humanity. So in Jesus Christ, the rejected one who suffers the wrath of God, we see that rejection means being cast out from the presence of God and suffering eternal death.

The Reformed theologian Louis Berkhof (1874-1957) and the Thomist Réginald Garrigou-Lagrange held kindred views regarding reprobation. Both distinguished preterition, or negative reprobation, and condemnation, or positive reprobation, arguing that positive reprobation is based on foreseen sin, while negative reprobation is not. Although both held that there is no reason other than God's will for God's decision to predestine some to salvation and to pass by others, Garrigou-Lagrange added that the motive for negative reprobation is God's will to manifest his goodness by his justice as well as by his mercy, while Berkhof said that God alone knows his reason for preterition.

Reproduction and ethics

The first reproductive issue debated extensively by philosophers was abortion. Debates about its morality were, and still are, dominated by the issue of the moral status of the foetus, on which a wide variety of views has been defended. The most 'conservative' view is usually associated with very restrictive abortion policies, inconsistent with 'a woman's right to choose' (though the connection has been challenged by Judith Jarvis Thomson). However, all but the most conservative find it hard to ground prevailing moral intuitions concerning the newer issue of using human embryos for research purposes. Embryos, and even gametes, also assume importance in the context of methods for overcoming infertility (artificial insemination by donor (AID), egg and embryo donation involving in vitro fertilization (IVF), surrogacy) where issues about rights and ownership may arise. Considerations of 'the welfare of the child', often used to settle surrogacy disputes, also bear on questions of what should, or may, be done to avoid bringing a child with a genetic abnormality into the world. Current philosophical literature on reproductive issues is largely limited to a vocabulary of rights and little attention is paid to the social and familial contexts in which reproductive decisions are usually made

1 l The status of the foetus

A wide range of views on the moral status of the foetus, and whether it is the sort of thing that may, or may not, be killed has been defended. (1) According to the 'conservative' position, the foetus has, from the moment of conception, the same moral status as an adult human being. (2) At the other, 'liberal', extreme, the foetus is claimed to be nothing but a collection of cells, part of the pregnant woman's body, like her appendix, until the moment of birth. Oddly enough, these diametrically opposed views share two assumptions; both assume that the moral status of the foetus remains unchanged from conception to birth and both assume that the foetus is, morally speaking, like something else - an adult or an appendix. Three other views reject at least one of these assumptions. (3) A 'moderate' view claims that the moral status changes at some determinate 'cut off point' such as motility or viability. (4) According to the 'gradualist' view, the moral status changes gradually, increasing as the foetus develops. (5) According to the 'potentiality' view, the foetus has a unique moral status, being quite unlike anything else, that of a potential human being, from the moment of conception. Minor variations on these views exist, beyond the scope of this entry; however, a well-known sixth must be mentioned. (6) According to Michael Tooley and his followers, whatever the foetus is, it is not a person, that is, does not have a right to life; and the same is true of infants (see Rights; Moral standing §3).

Each of these views has been not only defended, but contested. None has an argument to establish what the moral status of the foetus is that its opponents regard as conclusive and each has difficulties concerning its *prima facie* consequences, which may be seized upon by opponents as unacceptable. So, for example, the potentiality view's 'difficulty' is that it hardly counts as yielding any consequences at all. The conservative view appears to yield the consequence that if you can save only a baby or a two-day-old embryo in vitro from certain death, you are faced with just the same moral dilemma as when you can save only one of two babies in cradles. Tooley's view, notoriously, licenses infanticide, and so on. The difficulties become even more acute when we come to consider the treatment of foetuses not *in utero*.

2 Embryonic and foetal research

The debate about the status of the foetus assumed prominence in the days when abortion came to be seen as an issue of women's rights, and this was well before we had acquired the technique of fertilizing extracted ova in vitro, or discovered that foetal brain tissue might help adult human beings suffering from Parkinson's disease, or started on the 'genome project' (see Genetics and ethics §1). The gradualist or moderate positions were, perhaps, gaining ground, as the views that underpinned the legislation governing abortion in many Western countries, wherein increasingly 'serious' reasons for abortion are required as the pregnancy develops but abortion 'on demand' is allowed in the first trimester, until the new questions about the treatment of first-trimester-age foetuses (or embryos) hit the headlines, and people started manifesting qualms. In fact, research on quite well-developed - even viable - foetuses had been going on, but few people knew about it, and, in many countries, there was no legislation that covered it. Now there is, but the substantial restrictions laid down seem to fit badly with the policies which are fairly 'liberal' about first trimester abortions. If the moral status of a ten-week-old foetus is so

minimal that abortion 'on demand' is morally permissible, why do we insist on laws restricting the use of even two- or three-day-old embryos for research? In particular, why is it always assumed (as it is) that embryos may only be used as a last resort (when, that is, no other animals can be used to further the research), a restriction that those concerned about our exploitation of other animals rightly point out calls for some justification (see Animals and ethics).

In fact, the debates about these issues tend to dodge questions about morality and centre instead around legislation where considerations of the general consequences of allowing or forbidding certain practices become obviously relevant. Hence *prima facie* inconsistent positions which combine liberal abortion legislation with very restrictive legislation on the use of embryos and foetuses may be defended on the grounds that, as things are at the moment, liberal abortion legislation is a necessary evil, the only available way of avoiding desperate women resorting to backstreet abortionists or suffering the emotional and economic hardship of having babies they did not want and could not afford. However, this is hardly a defence that conservatives about the moral status of the foetus can employ; nor does it tend to recommend itself to those who defend 'a woman's right to choose'.

3 The right over one's own body

The prevailing emphasis on the status of the foetus has an odd effect; one could, if ignorant of the facts of human reproduction, read hundreds of articles written on abortion and be left wondering what they were. Those who maintain that, at least in the early stages, the foetus is just a growth in the woman's body, fail to mention the fact that it is a growth like no other, namely a growth that, uniquely, results from the cells of two human beings, and is a growth that will usually become a baby, someone's child, if allowed to develop. Those who hold the 'conservative' or 'potential' view emphasize the fact that a fertilized ovum naturally develops into a baby; some mention the fact that an ovum is fertilized by a male cell and that this usually happens as a result of sexual intercourse, but remarkably few mention the fact that the nine-month development into a baby standardly - and arduously - takes place in a woman's body. If one did not know better, one might reasonably infer that parthenogenesis was common and that many of the results of sexual intercourse were raised in incubators as in Aldous Huxley's *Brave New World*.

Conservatives about not only the status of the foetus, but also abortion do not deny that we all have some sort of right over our own bodies; they merely claim that it is restricted, or outweighed, by the foetus' right to life. This initially plausible move has been challenged, however, in a deservedly famous article by Judith Jarvis Thomson (1971), which, despite its age, still stands almost alone in its attempt to take account of what is special about abortion, namely that it is the termination of a (human) pregnancy. A human pregnancy, regardless of one's views about the status of the foetus, is a condition of a human body, and usually results from sexual intercourse, voluntary or involuntary, in the hope, or not, of conceiving. Thomson daringly allows the conservatives their premise about the moral status of the foetus and argues that, even if this is granted, the impermissibility of abortion does not follow in many cases. Her argument depends on the claim that the right to life does not, as such, include the right to the use of another person's body to survive. If you can survive only by being connected to my circulatory system for nine months, then my right to decide what happens to my body allows me not only to refuse and let you die, but, moreover, to disconnect us and thereby kill you if I have not granted you the right to use my body but have been kidnapped and connected up to you while unconscious.

The wild unlikelihood of the latter scenario reflects Thomson's heroic attempt to describe something that is not a pregnancy but is like at least unintended pregnancies in the (assumed) relevant respects, namely that one person (the foetus, granting the conservative view) needs the use of another person's body to survive, while the second person has not done anything that can be construed as giving them the right to use it. The strained nature of Thomson's analogies has attracted much criticism, but few of her critics have paused to reflect that any analogies to pregnancy are bound to be strained because there simply is not any other condition of the human body remotely like it.

Her article manages to take cognizance of remarkably many of the unique features of pregnancy but still leaves several out. When we turn from the issue of abortion to those of surrogacy, artificial insemination by donor (AID) and in vitro fertilization (IVF), the fact that a fertilized ovum has resulted from the cells of two human beings, a man and a woman, and the fact that it would become a baby, someone's child, if enabled and allowed to develop *in utero*, assume unavoidable prominence. Moreover, questions about what is involved in 'the right to decide what

happens to my body' and, more generally, what counts as 'mine', become increasingly problematic.

4 Rights and ownership

AID, IVF and surrogacy, as moral and political issues, revolve around those people who very much want to have a child; hence the question of whether the foetus has the moral status of something that may be killed tends to fade into the background, and passionate feelings about parenthood, families and 'my (our) child' come to the foreground. Those who espouse the conservative view on the status of the foetus do indeed object to the current practice of IVF on the ground that it tends to involve producing 'spare' embryos, which must either be allowed to die or be frozen and stored; but the various methods of alleviating infertility involve many further problems.

Feminists have found themselves divided over what to say about surrogacy, inclined, on the one hand, to defend the view that a woman's right to decide what happens to her body surely extends to deciding whether or not to act as a surrogate mother but inclined, on the other, to liken surrogacy to female prostitution, regarding both as practices in which the woman's body is *used* in an exploitative and degrading manner, even if she has, in some sense, freely consented.

Anyone who is, for whatever reason, inclined to defend at least some forms of surrogacy, has to consider what should be done when the agreement between the parties concerned breaks down - when, say, the surrogate mother changes her mind, and wants to keep the child, or the commissioning couple change theirs and do not want to take it. Some aim to settle these unhappy questions by arguing that surrogacy is a form of 'pre-natal adoption', whereby the commissioning couple acquire parental rights (and duties) to the embryo as soon as fertilization takes place; the surrogate mother cannot abort it, nor claim it, nor can the commissioning couple refuse to take it without this counting as their immorally abandoning it. Others aim to settle them by considering who owned the sperm and ovum involved initially, who can be said to have 'donated' or given up their rights to these gametes and who has retained them, whether the surrogate mother acquires a right to the baby by (in a new sense of the phrase) 'mixing her labour with it', and hence who 'owns' the baby, as though gametes, foetuses and children were like any other possessions. But, like the two most extreme positions on the moral status of the foetus, each of these approaches takes cognizance of only some of the facts relevant to human reproduction, ignoring those emphasized by the other side and leaving some out entirely.

5 Welfare considerations

What about, in particular, 'the welfare of the child', the consideration which, in practice, has pre-eminently been appealed to in resolving disputes when surrogacy agreements have broken down? This undoubtedly goes beyond the debates about the various adults' rights but it is not, thereby, a consideration independent of the facts that are appealed to in those debates. For, it may be said, it is in the best interests of any child not only to be wanted and loved by two adults, but also for its mother's love to spring from the natural bond that exists between the child and the mother who carries it and gives birth to it and, even further, for it to have the opportunity to know, and, we hope, love, its genetic parents. But these considerations resolve a surrogacy-agreement breakdown adequately (if that) only in the particular case in which the surrogate child is the genetic offspring of the surrogate mother and her partner and they decide mutually they want to keep the child. Otherwise, the decision has to be over the circumstances in which the child will be least disadvantaged.

That surrogacy and, indeed, AID, egg and embryo donation are all methods of overcoming infertility that, arguably, lead to the production of a disadvantaged child probably forms the strongest basis for those who are morally opposed to them all. Common claims that they are all unnatural, or introduce a third party into what should be 'the exclusive relationship between wife and husband', thus undermining the family, tend to fall foul of the obvious counter that few things are more 'natural', or more affirmative of the value of family life, than a couple's desire to have a child. But no-one thinks that this natural, proper, and in some cases, quite consuming, desire can, morally, be satisfied by any means. You cannot steal a child in order to have one, and, it may be said, you cannot set about bringing a disadvantaged child into the world in order to have one either.

The extent to which different methods of overcoming infertility produce, or would produce, a disadvantaged child is usually thought to vary. As I write, many people in Britain have said that it would be a terrible thing for a child to know that its 'mother' was an aborted foetus and, on those grounds, supported legislation designed to forbid any

future use of the ova already present in female foetuses. It is important to remember in cases such as these that the very existence of the child whose welfare would be at stake depends on the decision taken. The choice here, for example, is not between existence with a foetus as mother and existence without, but between existence with a foetus as mother and nonexistence. However, egg donation by mature women, embryo donation and AID, when uncomplicated by surrogacy, often pass unquestioned - though the recent discovery that an unscrupulous doctor at an infertility clinic in America was the genetic father of hundreds of children, having used his own sperm to fertilize all his patients, gave some people pause for thought.

Considerations of what sort of life a child produced in certain circumstances will have may also form the basis of adverse moral judgments of people’s selfishness and irresponsibility. Many condemned a fifty-nine-year-old woman who chose to have a child by IVF (though the same judgment is rarely passed on even older men who father children), and some insist that people carrying certain genes should get themselves sterilized and resign themselves to childlessness or adoption. It is sometimes even said that it is selfish and irresponsible of pregnant women to reject screening for genetic abnormality or to reject abortion when it is identified; but whether this is so surely depends on their reasons for the rejections. If they think, for instance, that the genetic abnormality does not prevent one’s life being a good one (perhaps because they or their partner have it themselves), or if they think that abortion, at least in their circumstances, is wrong, then they have a good reason for not trying to ‘maximize happiness’ on this occasion (see Utilitarianism).

6 Morality, legislation and rights

At this point we return to the abortion debate, but now under a new aspect and in a way that brings questions about infanticide more clearly to the fore. The most fundamental objection to the conservative position on the status of the foetus is that it puts abortion, at any stage, on a par with infanticide, and, in the usual context of the abortion debate, infanticide equals murder; on the conservative view, abortion in the case of rape is not one whit more justifiable than murdering a child conceived through rape, and arguably less justifiable or excusable (given the innocence of the child) than the woman’s murdering the rapist. But in the context of euthanasia, killing an infant, or allowing it to die, without its consent, may well not be counted as murder, even on a conservative view; not because, quite generally, infants fail to be ‘persons’ with a right to life, who can thereby be killed for any old reason (as Tooley suggests), but because, when a human being is by virtue of extreme youth (or perhaps extreme impairment) incapable of autonomy, ‘paternalistic’ considerations of their welfare form, quite properly, the determining factor (see Life and death).

So even on the conservative view on the status of the foetus, abortion in the form of ‘foetal euthanasia’ may be justified, as infant euthanasia may be; and on any view that ranks the foetus as somehow not quite the same as a born baby, the possibilities of justification increase. But a new twist has been added; ‘euthanasia’ has its motivation built in, since it is done for the sake of the one who dies. Morally speaking, there is all the difference in the world between seeking an abortion because one wants a ‘designer baby’, and seeking it because one thinks it is wrong to bring a disadvantaged child into the world, just as there is a difference between my instructing the doctors to take my mother off life support for her sake, and my doing it to save myself the medical bills. But, given that people can and will lie about their motives, there is no way in which legislation can effectively permit the well-motivated cases but prohibit the callous ones.

Much of the literature devoted to reproductive ethics in fact vacillates between discussing morality and legislation, frequently leaving it unclear which is at issue. This is, no doubt, in part the result of the current tendency to talk almost exclusively in terms of rights, for we tend to think of (moral) rights as things that should be protected by good legislation. But we too readily forget that, particularly within families, it may be morally quite wrong for me to exercise a right that I certainly have, and, more generally, that there is much opportunity within families for acting morally well or ill where questions of rights, and even duties, do not arise. Most reproductive decisions are made by couples who love each other, who discuss what ‘their’ decision will be; the discussion is often extended to other members of the family who will say ‘we’ decided; most of the couples want to be good parents, and morally good people. This is, indeed, how things should mostly be, but none of it can be brought about by legislation, and all of it is almost universally ignored in the current literature (see Family, ethics and the §5).

Republicanism

Significant divisions exist in all societies and communities of any size. The expression of these divisions in politics takes many forms, one of them republican. The hallmark of republican politics is the subordination of different interests to the common weal, or what is in the interest of all citizens. To ensure this outcome, government in a republic can never be the exclusive preserve of one interest or social order; it must always be controlled jointly by representatives of all major groups in a society. The degree of control exercised by representatives of different social elements may not be equal, and different styles of government are compatible with republican objectives. However, all republican governments involve power-sharing in some way. Even in a democratic republic political majorities must share power with minorities for the common good to be realized.

Maintaining an appropriate balance of political power is the chief problem of republicans. One or another faction may obtain control of government and use it to further its own interests, instead of the common weal. To prevent this republicans have developed a variety of strategies. Some rely on constitutional 'checks and balances' to cure the mischief of factionalism. Others seek to minimize factionalization itself by regulating the causes of faction - for example, the distribution of land and other forms of property. Still others promote civic religions in order to bind diverse people together. All these methods accept the inevitability of conflicting interests, and see the need to accommodate them politically. Hence, civic life is at the heart of republicanism.

1 Political diversity of republicans

Republicanism is a remarkably protean sentiment. It embraces the most famous republic of all, Plato's *politeia*, wherein philosophers rule. It includes Cicero's Rome under Numa and Servius Tullius, statesmen of the highest rank. It encompasses Machiavelli's Florence under the financial dominance of the Medici family. Republicanism includes Harrington's Oceana, and the representative government of Thomas Paine, wherein the common sense of ordinary people holds sway. It even includes Jean-Jacques Rousseau's vision of a polity ruled by the *volonté générale*, or general will, not to mention most contemporary regimes.

In terms of their politics, then, republicans are a diverse lot: they stand to the left of absolutism, to the right of majoritarianism, and at every point between these extremes. The political diversity of republicans arises from different conceptions of the public good, the object of republicans in all times and places. Plato's *politeia* was meant to be good for all residents of the city, not just for those who ruled (see Plato §14). For that reason Cicero called it *res publica*, a Latin term referring to 'the public affair'. Cicero's own version of the just regime, *De re publica, de legibus* (54-51 BC), or *On the Commonwealth* as the work is known in English, likewise stressed the ways in which the different peoples of a vast empire might be served by a common legal order. It highlighted the sense in which persons differentiated by rank, privilege and duty nevertheless might be unified in spirit, law and political allegiance (see Cicero).

Republicans of all stripes are committed to a public order in which every citizen has a definite standing or place. Associated with this place in the community are specific responsibilities, for example, the defence of the homeland, as well as certain rights or legal protections for citizens and their property. As long as all citizens assume their proper place and perform their appointed role in civic life, the public good is served. Justice prevails, in the sense that each person receives their due, whatever that may be (and it need not be the same for all). Conversely, if citizens fail to act as they should, or when they step out of place and exercise prerogatives rightly belonging to others, injustice occurs. The public order is disturbed, and if it cannot be restored the sense of commonality will unravel and the republic will expire.

Although republicans are committed to justice, they are divided over its meaning. They also disagree about the most telling signs of injustice and the best means of preventing harm to the common weal. Such differences are reflected in preferences for various forms of government and strategies for insulating government from factional strife.

2 Mixed forms of government

Classical republicans had a strong affinity for mixed government, an ideal that dominated Western political thought after Plato. According to this way of thinking, all pure forms of government tend to degenerate. Monarchy

generally gives way to tyranny, aristocracy becomes oligarchy, and democracy declines into ochlocracy, or mob rule. In each case, the interests of a single order or faction prevail at the expense of others' interests, and at the expense of the common weal. Mixed government is a solution to the problem, in so far as it combines elements of all three forms of rule: the one, the few and the many, each influences mixed government. Since all interests must be taken into account in policy making; justice is the necessary outcome of this balance of power.

In a mixed government, the power of one, few and many need not be equal. Historically, monarchic republicans favoured a mixture that gave kings the upper hand, on the presumption that only a strong monarch was capable of constraining ambitious nobles, on the one hand, and intemperate masses bent on furthering their own interests, on the other. Thus, Cicero preferred ‘'that there should be a dominant and royal element in the commonwealth' ([54-51 bc] 1976: 151). The sixteenth-century historian Guicciardini was of the same opinion; his Bernardo mourned the passing reign of the Medici in Florence. And in England, the Reverend Philip Hunton, Provost of Durham University, defended what he called 'mixed monarchy' against those who would oppose Charles I in the Civil War.

Aristocratic republicans preferred mixed governments dominated by the few, as long as they exhibited proper republican virtues: courage in military affairs, skill in diplomacy and a commitment to order and justice at home. Where such aristocrats held the balance of power, they resisted tyrannically inclined monarchs - and unruly peoples. This was the version of republicanism favoured by Machiavelli (§§5-6), who saw it as the most stable form of polity (Machiavelli 1531). In England, aristocratic republicanism was the choice of Algernon Sidney, who was executed for his role in a plan to assassinate Charles II and James II, although his democratic inclinations were exaggerated for political purposes by opponents and proponents of monarchy alike.

For their part, democratic republicans sought a larger role for the many in defining the public good and pursuing it by political means. Publius Valerius (friend of the plebians in Rome), Savonarola (religious and political reformer in Florence) and James Harrington (utopian writer in England), all favoured republics in which the people or their representatives exercised control over policy makers. In fact, it was during Harrington's life that 'republican' and 'republicanism' first entered the English language as an appellation for ‘Commonwealth men' and anyone else who wanted to reduce the power of hereditary rulers in England. Few of these republicans were democrats in a modern sense, although most remained dedicated to mixed government with a strong popular element. Not until the late eighteenth and early nineteenth century did republicanism come to be associated exclusively with the cause of popular sovereignty and majoritarianism, and applied to large, commercially-oriented nations (as distinct from the urban polities of the Renaissance or ancient Rome and Greece).

3 Republicanism and majoritarianism

Opponents of popular sovereignty always assumed that democratic republicanism led straight to majoritarianism, a form of rule that was suspect on two grounds. First, majoritarianism was a form of class rule, and therefore unjust on its face; and second, it was rule by the class least suited for political rule - ordinary folk, who were apt to place the interest of commoners above the common interest of all. Radicals such as Thomas Paine (§1)seemed to confirm this suspicion when they rejected the very idea of mixed rule in favour of a government composed solely of representatives elected by 'the people'. Paine's vision of simple government, infused with common sense and beholden to the majority, became the rallying cry for opponents of monarchy and aristocracy in Europe. In the subsequent political struggle against hereditary rule a modern conception of republicanism took root and flourished.

Interestingly, democratic republicanism stopped short of outright majoritarianism. Even Paine admitted that the first principle of the republic is justice, which rules out 'any species of despotism over each other, or doing a thing, not right in itself, because a majority of them may have the strength of number sufficient to accomplish it' (1989: 233). In other words, in a republic there must exist a balance between the will of a majority and the interests of political minorities. Majorities should defer to the legitimate rights of minorities, who must nevertheless accept the right of majorities to determine the direction of communal affairs. Thus, majorities and minorities each have a recognized place in the political order of democratic republics, which are not only more egalitarian, but also much larger, than the city-states of an earlier era (see Democracy).

Whereas classical republicans sought a balance of more or less immutable social orders, Paine and other modern

republicans, such as the US statesman James Madison, wanted a balance of political interests that might change places, so to speak. The composition of political majorities is not fixed; they may decline into minorities, just as minorities may ascend to majority status over time. To preserve this fluidity it was necessary to prevent majorities from abusing minorities, and to do so without undermining popular sovereignty. In the USA the Federalists' plan to 'extend the republic' was meant to encompass a broader range of interests, inhibiting the formation of majorities of the moment, the most likely source of abuse in a popular regime. Should this kind of majority ever form, the constitutional system of 'checks and balances' was supposed to frustrate any tyrannical impulses that might appear (see Constitutionalism).

On the other hand, power in the US system could be exercised by extraordinary majorities, which were much less likely to behave tyrannically than majorities of the moment (since the formation of large majorities depends on moderation and a regard for a broad spectrum of opinion, without which the coalition will not grow to the necessary size). In other nations the same effect has been achieved under political arrangements that require the concurrence of important linguistic, ethnic or religious minorities for policies to be adopted and implemented by numerical majorities. The presumption is that larger, more comprehensive majorities have a better view of the common good than bare majorities, who in turn see the common good more clearly than minorities of any sort.

4 Maintaining the republic

The preservation of a balance of interests is the leitmotif of republicanism. The constitutional plans of the Federalists were preceded by Harrington's reliance on the Agrarian Law as a means of stabilizing relations between diverse interests in the republic. Before that, republicans emphasized the importance of civic virtue as the foundation of order and political stability. Civic virtue implied a willingness to place one's talents in service to the republic. For most citizens this meant temporary service in militias raised to repel invaders. For a select few it meant a longer stint of public service, perhaps as political leaders, or in some other important capacity. The performance of various kinds of public service was deemed patriotic, and in that sense it was self-sacrificing. But in another sense it was self-serving; by contributing to the maintenance of the republic, citizens defended their place in the republic and whatever liberty it conveyed upon them (see Citizenship §2).

For many classical republicans instilling a love of ordered liberty among citizens required something like a civil religion. Certainly this is what Plato had in mind when he endorsed the propagation of a 'noble lie' concerning the origin of human differences and their embodiment in the division of political labour outlined in *Republic* (*c*.380-367 BC). Other republics had comparable myths of origin or founding, the purpose of which was to reconcile people to their place in a social order. The idea of a 'social contract' performs the same function in modern republicanism, which rests on a 'civic culture' that acknowledges different interests even as it stresses the importance of balancing them by political means. An even stronger version of this sentiment may be found today in communitarian thought, which stresses the bonds that unite different members of a polity (see Community and communitarianism §2).

Perhaps that is why Marx and other radicals of the nineteenth century favoured democracy over republicanism. For them the primary division in a society is between classes, defined in terms of their relationship to the means of production. With the abolition of private property, classes were expected to disappear and the state would no longer be a site of class struggle. In that sense radical democrats looked forward to the elimination of divisions among citizens, and hence an end to politics. Their solution promised to remove the entire *raison d'être* of republicanism: the reconciliation or accommodation of powerful and persistent divisions of interest in human communities.

Respect for persons

The idea that one should treat persons with due *respect is an important part of common sense morality, but opinions differ about when respect is called for, what it requires, and why. Respect for persons is also a central concept in many ethical theories. Some theories even hold respect for persons to be the foundation of all other moral duties and obligations.*

Respect *is distinguished commonly, on one side, from fear and submission, and on another, from admiration, liking and affection.* Respect for all persons as such *is distinguished normally from* esteem or special regard for persons of unusual merit. *Some philosophers identify respect with* agapē, *a special kind of love, but respect is perhaps most often regarded as a distinct attitude that should constrain and complement the promptings of love. Kant, for example, held that the requirements of respect and love are different, though compatible, and that both are dependent upon the more general and fundamental idea that humanity in every person is an end in itself.*

Other key issues in discussions of respect for persons include: what moral requirement, if any, there is to respect all persons; what the grounds, scope, and theoretical status are of that requirement; whether one can forfeit all claim to respect as a person; what 'respect for persons' demands with regard to specific problems, such as conflicts rooted in race and gender differences; and whether there is the same ground and obligation to respect oneself as to respect others.

1 Aspects and kinds of respect

The root idea of the word 'respect' is 'to look back' or 'to look again'. People speak of respecting a variety of things in addition to persons, for example, talents, achievements, character, laws, authorities, social positions, opinions, powerful forces, and even nature. A common thread seems to be the idea of 'paying heed' or 'giving proper attention' to the object of respect. Respect is generally an acknowledgement of the value or importance of something (or someone) from some perspective (presupposed in the context). It is often associated with awe, reverence, uncoerced willingness to obey or conform, or at least symbolic recognition of status, excellence or power. Depending on the situation, we can show respect *for persons* in a variety of ways: for example, by praising, giving tokens of honour, and accepting orders or advice, or merely by maintaining an appropriate social distance and refraining from expressions of contempt and arrogance. We may respect enemies without necessarily liking them, agreeing with their opinions, approving of their projects, or obeying them; but respecting them is incompatible with regarding them as utterly 'worthless' or 'insignificant'.

Is respect a feeling, a belief, a behavioural pattern, a disposition to act, or an attitude? Respect is often felt, for example, towards persons, standards, or institutions, but a mere feeling or sentiment would not count as respect without some corresponding disposition to *treat* the object in appropriate ways ('respectfully') and a *belief* that the object is worth such treatment. Respect is also more than merely respectful behaviour, for one can show respect deceptively when one does not feel or have it. In discussions of the morality of respect for persons, respect seems most often treated as an *attitude* that might be analysed as a combination of elements: beliefs, evaluative judgments, and policy commitments, as well as dispositions of behaviour and feeling, towards the person who is respected.

Respect for persons *as persons* is to be distinguished from respect for persons as professionals, officials, or members of more specific groups. We might, for example, respect an individual as a musician though not as person, if we thought that the person, though dishonest, is an extraordinarily talented and creative pianist. Even if we regard someone as both professionally inept and morally corrupt, we might, in a sense, respect the person as an official (such as a judge, a priest, or a prime minister) within an institution the authority of which we acknowledge. Here what is respected primarily is the office itself; but in other cases when we say we respect someone as, say, a judge, a priest, or a prime minister, we mean to imply that the person is a good official who fulfils the specified role well. Thus 'respecting a person as a -', where the blank is filled with a reference to a role or office, is ambiguous between, on the one hand, an attitude of due regard to the rights and privileges of the person's position and, on the other hand, an attitude appreciative of the excellence of the person's ability and performance in the position.

Although being a person is not the same as having a specific profession or public office, there is an ambiguity, similar to the one above, in the expression ‘respect for a person as a person’. In one sense, this indicates an appreciation that the person has good traits of character or personality, that is, traits that are generally considered desirable in persons whatever their particular roles and circumstances. For example, one might say of persons of known integrity, ‘They may be ineffective lawyers, but I respect them highly as persons’. In another sense, however, we might respect individuals as persons, even though we believe them to be immoral and lacking in most other human excellences. Here, ‘being a person’ is treated as if it were a widely inclusive, nonconventional status, analogous to holding a public office, with at least some minimum rights (or consideration due) independently of individual merit. To illustrate with an extreme and controversial example, some might say even of unrepentant Nazi war criminals that although their outrageous crimes deserve nothing but condemnation and they have forfeited their right to liberty, perhaps even life, we cannot simply discard them as worthless rubbish but must continue to respect them as persons (see Good, theories of the §3).

Darwall (1977) introduced the now common term, ‘appraisal respect’, for respect based on a positive assessment of the merits of individuals, whether as persons or as professionals. This is contrasted with ‘recognition respect’, which is a disposition to give appropriate weight in one’s deliberations to the fact that someone is a person (whether meritorious or not). It is obvious that we need not, and indeed cannot, respect every person as a person in the first sense, for in that sense respect implies a belief that the person in question has individual merits that deserve respect. What is controversial is whether we should respect all persons in the second sense - regardless of their individual merits - and if so, why.

When we say that persons should be respected *as persons*, the qualification ‘as persons’ may reflect, ambiguously and indefinitely, our view of the scope of the requirement, its grounds, how it is to be fulfilled, or several of these. That is, first, the point could be merely to say that *all* persons should be respected, without saying how or why. Alternatively, the suggestion could be, instead or in addition, that persons should be respected *because* they are persons. That is, the fact that people have the various features constitutive of persons might be seen as the pivotal premise in some argument, presupposed but not yet spelled out, to justify the claim that they should be respected. Finally, the point might be to give clues as to how respect is to be shown. Assuming a background of shared understanding about how various other things are treated appropriately, the injunction to respect persons as persons offers at least negative counsel: for example, persons should not be treated as mere expendable commodities, as instruments or playthings existing solely for our convenience or pleasure, as dogs, vermin, or dirt, or, more metaphorically, as mere statistics (as opposed to individuals with rights, feelings and particular interests). Again, assuming a common agreement on positive requirements for the appropriate treatment of persons, the injunction to treat persons as persons can serve rhetorically as a reminder to apply those standards to a particular case at hand. Here it says, in effect, ‘Treat these individuals in the manner that, as you know, is befitting their status as persons.’

Since commonly accepted standards for the appropriate treatment of persons and other things may be challenged, there is an obvious need for further thinking. Some ethical theories raise and respond to the following natural questions. Why must I respect all persons? What argument can justify the inference from ‘They are persons’ to ‘They should be treated in such-and-such a manner’? What, specifically, are reasonable, and not merely widely shared, standards for how persons should be treated (see Moral standing §2)?

2 Respect for persons in Kant’s ethics

The historical roots of most contemporary discussion of respect for persons are in the moral philosophy of Immanuel Kant (see Kant, I. §§9-11; Kantian ethics §1). Previous practice and theory often called for proper respect for individuals according to their social rank and individual merit, but Kant (1785, 1788), influenced by Rousseau, argued that all human beings have a dignity that is independent of rank and merit. All moral agents, by virtue of their rationality and autonomy of will, are jointly ‘authors’ of moral law, bearers of fundamental rights, and pursuers of ends that others may not ignore (see Autonomy, ethical; Moral agents). Moral duties are categorical imperatives, that is, rational requirements to which we are subject independently of the various personal ends that we choose to set for ourselves. According to Kant, there could be categorical imperatives only if there is something of absolute value; and only persons, as the source of all other values, could have this status. Persons exist as ‘ends in themselves’, of unconditional and incomparable worth, in contrast to things valuable

merely as means or as objects of affection. All rational persons, Kant thought, attribute this special value to themselves. Furthermore, he argued, they must acknowledge, on due reflection, that the ground for this self-attribution is not something unique to them but something they have in common with all other persons, namely, 'humanity' or the special human capacities identified with reason and freedom. Accordingly, a version of the categorical imperative, which is supposed to be a basic, comprehensive, and universal requirement of reason, is, 'Act so that you treat humanity, whether in your own person or in that of another, always as an end, and never as a means only.'

In *Die Metaphysik der Sitten (The Metaphysics of Morals)* (1797), Kant used this idea as a basis for both legally enforceable rights and ethical duties to respect others and oneself. In his theory of justice he implied that the status of persons as ends in themselves underlies all rights and, in particular, imposes limits on what legal punishments are permissible. In his theory of virtue Kant maintained that proper self-respect requires one to avoid drunkenness, gluttony, and servility and that respect for others is incompatible with arrogance, defamation, and ridicule. He also held that respect, together with love, is an essential element in friendship.

What is required morally, according to Kant, is to act with due respect, not to have or cultivate a mere 'feeling' of respect. This is partly because we cannot in general control our feelings by will in the way we can and must control our behaviour. Another reason is that respect for persons is derivative from respect for the moral law, and respect for the moral law, in Kant's view, is not something we choose to have or not but rather is something that, as human moral agents, we cannot help but feel. It is the humbling feeling that moral requirements reasonably impose limits on our attempts to satisfy our desires and pursue our personal ends. In so far as it is a form of respect for morality, then, the imperative to respect persons does not ask us to try to conjure up immediately, or even to cultivate over time, an 'affect' or sentiment that we might lack. Rather, what is required is that we choose to act so that, in practice, we live up to our own rational assessment of the worth (dignity) of humanity, a worth that all human moral agents (to some degree) recognize and feel.

3 Some later developments and applications

The idea of respect for persons has been interpreted in various ways, and has served different functions, in philosophical discussions before and after Kant. Contemporary moral philosophers often appeal to principles of respect in support of their judgments regarding practical issues, and some have attempted to develop ethical theories with respect for persons as the basic moral requirement. Downie and Telfer (1969), for example, treat the attitude of respect as morally basic. This attitude is characterized as 'valuing and cherishing persons for what they are'. It is identified as a kind of love, *agapē*, which requires 'active sympathy'. The concept of 'persons' itself is viewed as an evaluative concept, though not in a way that makes the injunction to respect persons trivial. What is morally salient about persons is that they have 'rational wills'; that is, they are 'self-determining and rule-following'. This is understood in a sense, taken to be different from Kant's, that includes affective and emotional capacities. Respect for persons requires that we make the ends of others our own and be ready at least to consider how others' rules apply to them and ourselves. This requirement is supposed to be consistent with utilitarianism, but not derived from it; to the contrary, Downie and Telfer (1969) have argued that utilitarianism is in fact derivable from a principle of respect for persons (see Utilitarianism).

Alan Donagan (1977) also presented respect for persons as the core of morality. He interpreted Kant's imperative to treat humanity as an end in itself as the principle, 'It is impermissible not to respect every human being, oneself or any other, as a rational creature.' This, he claimed, is the basic principle of those aspects of traditional Western morality not based on theological beliefs. Respect for persons 'as rational creatures', in Donagan's view, is a descriptive term, difficult to define, but familiar in social science and everyday life. Thus he thought it possible to spell out the meaning of the phrase in 'specificatory premises' which enable one to derive from the basic principle a system of intermediate moral principles regarding truth-telling, promise-keeping, non-injury, charity, family, property, obedience to law, and cultivation of one's own health and mental powers. Guided by prior work of Jewish and Christian casuists, he argued that the resulting principles would incorporate more flexibility for exceptional circumstances than Kant admitted but far less latitude than advocated by contemporary consequentialists (see Casuistry; Consequentialism). The system of principles, he claimed, is grounded in reason, not faith. Although he presented morality as a system of principles derived deductively from a first principle, he disclaimed the 'foundationalist' idea that the first principle is 'self-evident' or more certainly rational than the

intermediate principles (see Foundationalism).

Attempts to make respect for persons a comprehensive standard invite various sceptical responses (see, for example, Cranor 1975; Frankena 1986; Hill 1993). It is questionable, for example, whether the idea of respect is sufficiently substantive and descriptive to serve the role it has in Donagan's theory. Further, common usage suggests, and many philosophers agree, that respect is not at issue in all moral contexts, even though it is an important consideration in many. Rather than an all-encompassing first principle, it is one moral consideration along with many others (such as beneficence and gratitude) (see Moral pluralism). Treating respect for persons as the comprehensive source of all moral duties also raises serious questions about the grounds for decent treatment of nonrational animals and human beings with severe mental incapacities (see Animals and ethics). Also, most utilitarians would deny the primacy of respect for persons, and, to be consistent, all of them must object to principles of respect if they demand acts, rules, and motives that promote less than maximum utility.

Not all contemporary discussions of respect for persons, however, are focused on this controversy about the primacy and scope of respect principles. Many concentrate instead on the implications of respect for persons with regard to particular moral issues, such as racism and sexism, violent protest, pornography, punishment, privacy, legal enforcement of community values, and paternalism in medicine. Self-respect has also been a common theme. Most notably, Rawls (1971) has argued that his theory of justice is morally preferable to utilitarian theories because it better affirms and supports the self-respect of citizens. Sachs (1981) and others have noted significant distinctions between self-respect and self-esteem, and the idea that one should respect oneself is a common premise in recent moral arguments, for example, that no one should passively tolerate humiliation and oppression.

Responsibilities of scientists and intellectuals

Do scientists and intellectuals bear responsibilities peculiar to them? If an 'intellectual' is whoever has a committed interest in the truth or validity of ideas for their own sake and a 'scientist' anyone possessing a special competence in the natural or social sciences, they may indeed be more likely to find themselves in certain characteristic positions of responsibility. In the case of intellectuals, the importance of providing checkable justification of claims made in their pursuit of truth brings certain responsibilities. Scientists may be said to have responsibilities for pursuing truth in their own areas of competence, for wielding their social power appropriately, for making their results generally accessible and for using resources properly. But these apparently special responsibilities are nevertheless to be understood as rooted ultimately in those which any human being may, in the relevant circumstances, be thought to bear to their fellows.

1 The terms of debate

In what sense might scientists and intellectuals have responsibilities different from those of any other member of society (see Responsibility)? Clearly the question is not one of their strictly contractual responsibilities. Anyone employed to teach or to engage in research on the basis of a contract of service will legally have whatever responsibilities are specified in their contract. Of course, teachers, doctors, priests and plumbers among many others will be widely assumed to have responsibilities stemming from the roles that they occupy going far beyond any that may be set out in their contracts of employment. In that sense one might say that all members of society have an obligation to fulfil whatever responsibilities are generally taken to be incumbent upon them in virtue of the roles that they may occupy, whether specified in their contracts or not. But there are wide differences between different types of role in different types of society. In most contemporary societies, for example, nobody can qualify as a doctor or lawyer without passing certain well-defined tests. One can be expelled from these roles by the appropriate authorities acting in accordance with recognized procedures, or one may cease to occupy them of one's own accord. Moreover, lawyers, doctors and many others have produced for themselves fairly elaborate codes of ethics designed to make explicit many of their most recognizably important responsibilities, which does not mean that it always puts their proper line of conduct beyond all possible doubt (see Professional ethics). (Among lawyers' chief responsibilities are those of seeking always to do their best for their clients and of never knowingly misleading the court. What to do when these responsibilities clash is, very sensibly perhaps, left open to potentially divergent judgment.) Other social roles, however, may differ in a whole variety of ways. The institution of marriage, for instance, differs notoriously from one society to another (and even within some overall societies) not least in the degrees of freedom, if any, with which those concerned may or may not enter upon or renounce that state - as also in the diverse responsibilities which may be considered to go with it. The same is true of many other socially recognizable roles.

Problematic as the search for common agreement as to the responsibilities attendant upon such roles and institutions may be, there are at least generally clear criteria for determining whether or not someone actually is a doctor or lawyer, husband or wife. This is somewhat less clear in the case of so-called common-law husbands and wives, much less clear in the case of scientists and very much less so in that of intellectuals. Is the term 'scientist' to be reserved for those working as teachers or researchers in the area of the natural sciences? What exactly is the extent of that area? What level must they have achieved to be entitled to this appellation? What of those who once worked in that area, but who have moved to other fields or have simply retired? Nevertheless, if anyone asked me, as a university teacher, which of my colleagues were scientists, I should not expect many of them to disagree with my response. If asked how many were intellectuals, however, I should first need to settle on what exactly we might both understand by that expression.

For present purposes, then, we need to stipulate some guiding definitions. The term 'intellectual' I take to refer to anyone who takes a committed interest in the validity and truth of ideas for their own sake independently of their causal relationships to whatever other ends. The term 'scientist' I take to refer to anyone possessing a specialized competence in the natural or social sciences, leaving open questions as to which of the social studies at what stage of their development should be treated as sciences (in whatever sense of that term) and what level of competence should here be counted as sufficiently specialized. Thus defined, the classes of intellectuals and of scientists will, of course, show a substantial, if indeterminate, overlap. They are nevertheless by no means identical, for not only

will there be many nonscientific intellectuals, but many scientists will be interested in the truth and validity of their ideas not so much for their own sake as for that of what can be done with them.

However, in so far as scientists and intellectuals (thus defined) occupy social roles, they do not do so in such explicitly determinable manner as do doctors or barristers. Moreover, there are no constituted bodies who might properly take it upon themselves to draw up a code of ethics for them. If, then, we attribute to them certain special responsibilities, it must be in virtue of certain generally recognizable characteristics of their roles rather than of any formally defining constitution.

2 Intellectuals

Let us take first the case of intellectuals, whether they be scientists or not. Our definition is, of course, cast in terms that reflect the relative indeterminacy of the concept of an intellectual itself. There is much room for debate and disagreement about what might count as validity and truth in the assessment not just of statements, propositions or sentences, which is complicated enough, but even more so of something as indefinite as ‘ideas’. Still, such debates are themselves typical of intellectual concerns. And whatever its degree of indeterminacy on the margins, the overall difference is clear enough between those whose interest in ideas is primarily from the point of view, say, of their history or that of imaginative play, but for whom consideration of their validity or truth remains firmly in brackets, and those for whom that consideration is their first preoccupation. In other words, intellectuals, according to our definition, are interested not only in ideas, but also in questions concerning their possible justification.

Justification, however, is a fundamentally serious matter. If one genuinely wants to assure oneself whether a given set of ideas is justified or not, one cannot knowingly rest content with only half-thought-out approximations. One is, so to speak, responsible to oneself, to others and before the tribunal of whatever ideas are under consideration for the seriousness of one’s endeavour to probe the matter of their justification. There is nothing essentially secret about this responsibility to oneself. On the contrary, the first responsibilities, which in a sense underpin all others, are those reciprocally reflexive responsibilities generally incumbent on every speaker of a language to respect those overall norms of truth and reference on which the stability of its meanings depends. To that not insignificant extent all participants in meaningful discourse have an implicit share of responsibility for the validity, even indirectly the truth, of the meanings and concepts on which their discourse is based; and to that same extent, however surprising it may appear to them, all participants in discourse have at least an implicit foot within the terrain of intellectuals. Those who have come to occupy positions which may justify their being picked out as intellectuals, however, can justly be said to have a more special and explicit responsibility; they may rightly be called upon to answer to their communities of common communication for the truth or validity of what they may have to say. This is no light responsibility; for, as Vaclav Havel has shown so well in his essay on *The Power of the Powerless* (1985), a society which has lost the most fundamental capacities for ‘living in the truth’ is one which has exposed itself to the most fundamental forms of corruption and demoralization.

It should be noted, incidentally, that it is not only intellectuals as such who bear a special responsibility for truth and validity. It falls also upon teachers to a very special degree. (Of course, all participants in human discourse may, at times and often willy-nilly, also find themselves fulfilling some of the functions of a teacher; but again the more explicit responsibilities fall upon those who openly occupy such a role.) Naturally, many teachers will also be intellectuals, just as many intellectuals will be teachers; but again the two classes are not coextensive, and neither is wholly included in the other.

3 Scientists

To those (very many) scientists who are also intellectuals the same responsibilities may be ascribed as to any other intellectual as such. What other questions of responsibility arise? They may seem to fall in the main under three heads, none concerning scientists alone, but all perhaps presenting themselves to scientists with an often peculiar urgency.

First, scientists may be held responsible, by others but more particularly by the scientific community itself, not simply for respecting the truth about whatever their domain of research may be, but, more positively, for remaining uncompromisingly active in their pursuit of as yet undiscovered truth. Many would say that this respect for truth

must include a commitment to make the results of their research publicly available. Some scientists, indeed, would maintain that this is, strictly speaking, their only responsibility *qua* scientists.

Second, however, in the world as it now is, scientists, or at any rate certain among them, are in a position to furnish it with its most powerfully necessary and perhaps sometimes sufficient means of life and death - not to mention many of its other most powerful instruments for the ongoing transformation of our environment and of our lives together. (One may think of nuclear research and of its applications to nuclear weapons, or of research into the human genome; but there are many other examples (see Technology and ethics; Genetics and ethics §1).) Scientists may thus possess very real social power. Should they be held peculiarly responsible - as scientists - for the ways in which that power may be exercised?

Third, certain scientific research programmes may cost sums of money that are already very large in themselves, but, more to the point, quite enormous as a proportion of the money socially available. Of course, the results of such research may bring enormous more or less long-term returns - to society at large maybe, but also to more restricted sectional interests, perhaps even to the scientists concerned themselves. At all events, those seeking such investment, whether from public or from private sources, will be expected to justify their requests, and may naturally be held responsible for their proper seriousness as well as for the honest and non-wasteful use of the resources allocated to them. They may also find that their sponsors, whether governmental or commercial, will make it a condition of their support for research that its results should not be made public.

In principle, however, none of these issues and dilemmas really concerns scientists alone. Power is distributed widely in society in all sorts of complex and interconnected ways. In particular, other nonscientific intellectuals, teachers or researchers may also occupy positions of diverse forms and degrees of power. Indeed, as Michel Foucault persistently pointed out, knowledge and culture themselves constitute formidable resources for the exercise of power. Again, many nonscientific researchers also may seek and receive substantial financial support - not to mention all those other forms of cultural activity which can flourish only on the basis of such subsidy. Nor is it scientists alone who may be held responsible for continuing unremittingly in the search for as yet undiscovered truths. Historians furnish just one among a whole number of other possible examples.

There are also important connections, including potential trade-offs, between these three groups of issues. For example, the (presumed) importance of whatever one is seeking to discover as the result of any given research has to be measured against its likely cost. Again, the more money one has at one’s disposal in mounting a research programme, the greater one’s potential power for all sorts of purposes. Conversely, the stronger one’s initial position in the field, the greater one’s chances of obtaining substantial financial and other institutional support.

None of these responsibilities, of course, exists as pure indisputable fact. The questions of their exact nature and weight, of whom they should fall on and even of their very existence, are all open to controversy. In the end, however, it is fair to say that they all derive ultimately from the reciprocal moral responsibilities of human beings as such - of human beings who may find themselves in one role or another, endowed with one set of capacities or powers or another, but whose responsibilities in the exercise of those roles or powers derive fundamentally from the general responsibilities which human beings may be thought to have to one another in so far as they are able to think of themselves as moral beings at all (see Moral agents; Universalism in ethics).

Responsibility

To be responsible for something is to be answerable for it. We have prospective *responsibilities, things it is up to us to attend to: these may attach to particular roles (the responsibilities of, for instance, parents or doctors), or be responsibilities we have as moral agents, or as human beings. We have* retrospective *responsibilities, for what we have done or failed to do, for the effects of our actions or omissions. Such responsibilities are often (but not always) moral or legal responsibilities.*

The scope of our retrospective moral responsibilities is controversial. We are responsible for the intended results of our actions, but how far we are responsible for their foreseen effects, or for harms that we do not prevent when we could, depends on how we should define our prospective responsibilities, that is, on how far we should regard such foreseen effects, or such preventable harms, as our business. To say that I am responsible for some foreseen effect, or for a harm which I did not prevent, is to say that I should have attended to that effect or to that harm in deciding how to act; our retrospective responsibilities are partly determined by our prospective responsibilities.

I am responsible for something only if it is within my control. It is sometimes argued that I am therefore not responsible for that whose occurrence is a matter of luck; but it is not clear that we can or should try to make responsibility wholly independent of matters of luck.

We have responsibilities not merely as individuals, but also as members of organizations (organizations themselves have responsibilities in so far as they can be seen as agents). This raises the question of how far we are responsible for the actions of groups or organizations to which we belong.

1 Prospective and retrospective responsibility

Our concern is with responsibility-ascriptions of the form '*A* is [was] responsible for *x*'. Such locutions may ascribe merely causal responsibility ('the earthquake was responsible for the damage'); but our concern is with normative ascriptions which hold an agent answerable for something.

My *prospective* responsibilities are those I have before the event, those matters that it is up to me to attend to or take care of. These are often tied to specific roles: I may have responsibilities as a teacher, or parent, or doctor (see Professional ethics). But we also have responsibilities as friends, as citizens, perhaps even as human beings (to pay some attention to the interests of other human beings), or as inhabitants of this planet (to have some practical concern for its future) (see Help and beneficence; Future generations, obligations to; Environmental ethics). My prospective responsibilities are those I have in virtue of satisfying some description - 'teacher', 'parent', 'human being'; and we may disagree about just what responsibilities, if any, belong with particular descriptions.

My *retrospective* responsibilities are those I have after the event, for events or outcomes which can be ascribed to me as an agent. I am retrospectively responsible for what I do, or fail to do, in discharging my prospective responsibilities. A doctor who cures a patient is responsible for that cure; one whose treatment (or lack of it) causes death is responsible for that death. More generally, though, we are responsible for at least some of the results of our actions, most obviously for those we bring about intentionally (see Intention). If I kill *V* intentionally, I am responsible for *V*'s death (see §§2-3).

To hold *A* responsible for an event is not yet to say that *A* should be blamed for it, partly because praise, rather than blame, may be due; and partly because I can avoid blame for an untoward event by justifying my action (I killed *V* intentionally, but did so in self-defence) (see Praise and blame). To be responsible for *x* is to be answerable for it. I can be called to account for it: to explain, justify or admit my culpability for bringing it about or failing to prevent it. Retrospective responsibilities may also bring liabilities. If I am responsible for the harm that someone suffered, I may be liable to censure or punishment for causing that harm, to make compensation for it, or to apologize for it.

Such responsibilities, prospective and retrospective, flow from a conception of our moral duties and relationships, or are ascribed by a legal system. But they may be neither moral nor legal: a sports referee, for instance, has prospective and retrospective responsibilities, but they are not all a matter either of morality or of law.

Only responsible agents, those with the capacities necessary for accepting and discharging responsibilities, can be

held prospectively or retrospectively responsible. Just what those capacities are depends on the kind of responsibility at stake. Only moral agents can have moral responsibilities (see Moral agents; Free will); but the law specifies its own criteria of responsible agency, which might differ between criminal and civil law. However, in so far as criminal responsibility entails liability to punishment, which itself involves censure, we can hold that the criteria of criminal responsibility should match those of moral responsibility (see Crime and punishment §1).

A responsible agent is one who can be held prospectively or retrospectively responsible. A different use of 'responsible' concerns the agent's attitude to their responsibilities. A responsible person is someone who can be trusted to discharge their prospective responsibilities, and to accept their retrospective responsibilities; an irresponsible person is not one who has no responsibilities, but one who does not take their responsibilities seriously.

2 The scope of responsibility

One general question about retrospective moral responsibility concerns its scope: what are we responsible *for*? An answer to this question depends partly on an account of the scope of our prospective responsibilities.

I am most obviously responsible for the directly intended results of my actions. I make myself responsible for them by directing my action towards bringing them about. I am also responsible for at least many events which I am certain will ensue from my actions. An arsonist who realizes that the fire they start will kill someone is responsible for that death, whether or not they directly intend it (but see §3).

Those who deny any intrinsic moral difference between direct intention and foresight argue that I am as responsible for any certainly foreseen consequence of my action as I am for its directly intended results (see Double effect, principle of). Those who deny any intrinsic moral difference between 'acts' and 'omissions' also argue that I am as responsible for events which I could but do not prevent as I am for effects which I actively bring about. For whether I act with the intention of bringing *x* about, or simply knowing that x will ensue if I act thus; whether I actively bring *x* about, or do not do what I know would prevent *x*; in each case I know that I can determine, by my action or inaction, whether *x* occurs or not.

To deny any intrinsic moral difference between direct intention and foresight, or between acts and omissions, is to hold that I am retrospectively responsible for whatever was within my control; and *x* was within my control if I knew that it was within my power to determine, by my action or inaction, whether *x* occurred or not. More precisely, control as thus strictly defined is held to be a *sufficient* condition of responsibility. I am responsible at least for what I thus control. It is not a necessary condition of responsibility. I am responsible for harm I cause recklessly or negligently; but a reckless agent realizes only that their action might cause harm, while a negligent agent is unaware even of a risk that harm will ensue. A weaker 'control' requirement still holds here, however. I act recklessly or negligently only if I know, or could and should have realized, that my conduct might cause harm and that I could avoid that risk by acting differently. (Such retrospective responsibility depends on prospective responsibility. I act recklessly or negligently as to some harm only if I should have taken care with regard to it.)

But is control sufficient for responsibility? To argue that it is, that I am retrospectively responsible for all that lay within my control, is to take a particular moral view of our prospective responsibilities as moral agents. If we believe that agents should attend to all the foreseen effects of their projected actions (in particular that they should see the fact that some harm will ensue from an action as a reason against acting thus), we will hold them responsible for all such foreseen effects; if we believe that agents have a general, stringent duty of care towards all others, to save them from harm, we will hold them responsible for any harms which they knew they could have prevented. But such beliefs are morally controversial. If I believe in the free market, I might deny responsibility for my competitor's ruin, which I knew would ensue from my commercial activities. Such an outcome of my legitimate commercial activity, I may say, is not my concern; it is not something I should attend to as a reason against acting thus. But a critic of the free market might insist that I am responsible for my competitor's ruin; that I can avoid blame for it only if I can justify my action of ruining them (see Market, ethics of the). Likewise, while I may recognize some general responsibility towards others, simply in virtue of our common humanity, to help them if they are in grave distress, I might insist that that responsibility is limited. If I fail to save the lives of distant strangers, my responsibility for their deaths is less than it would be if I made myself fully responsible for their deaths by deliberately killing them; if I do not prevent some trivial harm befalling another, I may deny any

(retrospective) responsibility for that harm, by denying any (prospective) responsibility to take such care for their interests. So to determine the scope of our retrospective responsibilities, we must determine the scope of our prospective responsibilities; where moral responsibility is at stake, that must be a moral determination.

Our particular roles, which help determine our prospective responsibilities, thus also help determine our retrospective responsibilities, most obviously by extending them. I could, but do not, stop a child committing a minor act of vandalism. If the child is a stranger, I might deny responsibility for the damage - it was not my business to control the child; but if the child is in my care, I cannot thus deny responsibility. Our roles may also, however, limit our responsibilities. I know that if I fail this thesis, the candidate will lose their academic job. But I might insist that my responsibility as an examiner is to judge the thesis on its merits; the further effects of my decision are not my concern (the candidate's prospective dismissal is not something I should attend to as a reason against failing the thesis), and I am not responsible for them.

Conceptions of prospective and retrospective responsibility help to determine our very descriptions of people's actions or omissions. As a free marketeer I might deny, but others might insist, that I 'ruined my competitor', since whether that is an appropriate description depends on whether I am responsible for my competitor's ruin. Likewise, we can say that someone 'let *x* happen', or 'failed to do *y*', only if there was some expectation that they would or should prevent *x* or do *y*.

3 Responsibility and luck

The connection noted above between responsibility and control underpins the idea that moral responsibility is incompatible with luck. How can I be morally responsible for some harm if its occurrence was a matter of luck, and thus not within my control?

But this idea threatens to undermine my responsibility for the actual (intended or foreseen) effects of my actions. For the occurrence of such effects depends on factors outside my control, and is thus arguably a matter of luck. The success of an attempt depends not merely on the agent, but on external factors which they do not control; if it fails because of one of those factors, that failure is a matter of luck. Similarly, it is a matter of luck whether a reckless or negligent action causes harm. How then can I be held morally responsible for the actual effects of my actions, if their occurrence is a matter of luck?

Those who argue in this way do not typically argue that the intrusion of luck precludes every kind of responsibility: I am responsible for the actual harm that I cause in that I may be liable to pay compensation for it. But luck does, they insist, preclude responsibility as *blameworthiness*. I am blameworthy only for what is strictly within my control, and not for that whose occurrence depends on luck. One who attempts to do harm is blameworthy for the attempt, but their culpability is not affected by the chance fact of success or failure; those who act recklessly or negligently are culpable for their reckless or negligent acts, but are no more culpable if they actually cause harm than if they do not.

To assess this argument, we must attend to three matters. First, it seems to misuse the contrastive concepts of control and luck. We do not normally think that we lack control over all the effects of our actions, or that those effects always depend on chance. One confusion here is to think that if the occurrence of x depends on any factors outside my control, I do not (really) control it; another is to move from the true claim that my control over anything is not invulnerable (I could lose it) to the false conclusion that I therefore do not (really) have control.

Second, it might be argued that our ordinary talk of control and luck is loose or metaphysically shallow. There is a deeper sense in which all that we do is vulnerable to chance, which captures a deeper truth about our lack of (real) control over the external world. But this metaphysical thought (if it is coherent) threatens any idea of control. If for this reason I do not (really) control the effects of my actions, I do not control my actions or intentions either. For these too are vulnerable to chance, and depend on factors outside my control.

Third, we must none the less admit that the actual outcome of an action is sometimes a matter of luck. It might be a matter of luck that an attempt fails, or succeeds; that a reckless action causes harm, or does not. Should we then, in ascribing moral blame, ignore such matters of luck; draw no distinction between the successful and the failed assailant, or between lucky and unlucky reckless agents? This suggestion, however, requires us to draw a sharp distinction between moral blame, or judgments of moral culpability, and those other aspects of our understanding

of and responses to a person's action which are structured by its actual effects; it is not clear whether that distinction can be drawn (see Moral luck).

4 Collective responsibility

We must also attend to collective, or shared, responsibilities: the responsibilities of organizations or groups; the responsibilities individuals have as members of organizations; and whether such membership can make us responsible for the actions of others.

We can talk of the responsibilities of organizations such as corporations, universities, governments and nations in so far as we can see such collectives as agents - as capable of acting purposively, as being potentially answerable for what they do or fail to do. The actions of such organizations involve, of course, the actions of individual agents within them; but that is not to say that descriptions of corporate actions can be reductively analysed without loss into descriptions of individual actions of individual agents (see Holism and individualism in history and social science).

Our prospective and retrospective responsibilities, as individuals, are often defined partly by our roles within organizations: I may have responsibilities, for instance, as a teacher, as an employee, as a director, as a minister. Such responsibilities are defined initially by the organization itself, in the light of its purposes and values. But there is obviously room for controversy (often moral controversy) about what our role-responsibilities ought to be, and about when and whether they may be overridden by moral responsibilities which transcend our particular roles.

In so far as I have responsibilities within an organization, I share, with other members of the organization, responsibility for what the organization does. But is that responsibility limited to the part which I play directly, or could and should play, in the organization's actions? Or can I properly be held responsible for the actions of others in the organization even though I did not myself have authority or control over them? Can I be held responsible for actions of the organization to which I did not contribute directly, and which I could not control? If the government of my country behaves despicably, can I disavow responsibility by pointing out that I voted against that party or that measure; or must I still see that action as being in some sense 'mine', as a citizen of this country? Indeed, can or should I accept responsibility for my country's actions before I was born?

Answers to such questions depend on getting clear about what it is to be a member of a group, and about what it is to be responsible. It would, for instance, be absurd to blame myself for governmental actions over which I had no control, or which were done before I was born; but it is not obviously absurd to feel shame for them, or think that it is up to me (though not of course up only to me) to apologize for them, or to try to find some way of making up for them.

Resurrection

*The Judaeo-Christian belief in a future general resurrection of the dead arose in late second-temple Judaism (see, for example, Daniel 12: 2 and John 11: 24). (Whether there would be a resurrection of the dead was one of the main points that divided the Pharisees and the Sadducees.) When the new Christian movement appeared - before it was clearly something other than a party or sect within Judaism - it centred on the belief that the crucified Jesus of Nazareth had been, in a literal, bodily sense, raised from the dead (*resurrectus*) and that his resurrection was, in some way, the means by which the expected general resurrection of the dead would be accomplished. Indeed, resurrection was so pervasive a theme in early Christian preaching that it was apparently sometimes thought that Christians worshipped two gods called 'Jesus' and 'Resurrection' (*Anastasis*). The early Christians generally said that 'God raised Jesus from the dead'. In post-New Testament times, it became more common for Christians to say that 'Jesus rose from the dead'. Belief in the resurrection of Jesus and a future general resurrection continue to be central to Christianity. Christians have always insisted that resurrection is not a mere restoration of what the resurrected person had before death (as in the story in the fourth Gospel of the raising of Lazarus) but is rather a doorway into a new kind of life. The status of a belief in the general resurrection in rabbinic Judaism is difficult to summarize. It should be noted, however, that a belief in the resurrection of the dead is one of Maimonides' 'thirteen principles', which some Jews regard as a summary of the essential doctrines of Judaism. A belief in a general resurrection of the dead is one of many Judaeo-Christian elements that have been incorporated into Islam.*

1 The concept of resurrection

The concept of the resurrection of the body (or of the dead) is most easily explained by laying out the ways in which it differs from the most important competing picture of the survival of death, the Platonic picture. According to Plato (§13), when one dies (that is, when one's body dies), one will continue to be what one has been all along, a soul: an immaterial centre of consciousness, reason and action. One's death is, therefore, an extrinsic change in one: being dead means simply no longer having a body to animate. Since one's death is an extrinsic change in one, one's survival of death is something that happens in the natural course of events: one continues to exist after death by the continued exercise of the same powers or capacities that enabled one to exist when one still animated a body. (This inference is natural and plausible, but, as Descartes would later point out, it is not logically valid: for all logic can tell us, animating a body might be essential to the existence of a soul.) Death is, moreover, not a bad thing, as the vulgar believe, but a liberation, for the body is a prison of the soul - or it might be likened to a millstone that drags the soul down into the world of flux and impermanence. The liberation of the soul by death will not, unfortunately, be permanent, for the soul is destined repeatedly to suffer the misfortune of embodiment.

Christians, Jews and Muslims who believe in the resurrection of the dead will accept two of Plato's theses about death: that the person does survive death, and that dead persons will not be forever disembodied. But everyone who believes in resurrection will dispute the following elements of Plato's metaphysic of body, soul and death: that the body is a prison; that the soul must by its very nature survive the death of the body; and that the embodied soul has been disembodied in the past and will experience a large, perhaps infinite, number of 'reincarnations' in the future. Christians, moreover, will insist that the new bodily life that awaits the soul (the saved soul, at least; perhaps this is not true of the damned) will not be of the same sort as its earlier life. The doctrine of resurrection, however, is no more than a doctrine. It is not a worked-out metaphysic of body, soul and death. (The primary biblical data concerning the metaphysics of resurrection are found in 1 Corinthians 15: 35-55. This passage, however, is open to a variety of interpretations.)

There are several competing philosophical theories of the metaphysics of resurrection. Some who accept the doctrine of resurrection deny the existence of a separable, immaterial soul. Examples include Tertullian, who argued in his *De anima* (*c*.210-13) that the soul is corporeal, and, in the twentieth century, the Scottish computer scientist D.M. MacKay (1987) and the English physicist J.C. Polkinghorne (1994). Others accept the existence of an immaterial soul, but differ on the question whether the person, the 'I', *is* the immaterial soul. Aquinas (§10), for example, sees the human person as essentially a composite of a human soul and a human body. According to the 'composite' theory, a person cannot exist without a body: to exist is for one's soul (always numerically the same) to animate some human body or other. (In the interval between one's death and one's receiving a new body at the time of the general resurrection, one's soul exists and thinks and has experiences, but *one* does not, strictly

speaking, exist.) However, others who believe in a separable soul - most of the Fathers of the Church, and, probably, most Christians who have not given the matter much thought - accept a metaphysic of soul and body that is deceptively similar to Plato's: one *is* an immaterial soul, and one will exist and think and have experiences throughout the interval during which one is without a body. But even the members of this party - the theologically well instructed among them, at any rate - would accept the following anti-Platonic theses: that the death of one's 'first' body is not a natural consequence of the impermanence of material things, but is rather a result of the Fall; that the soul's survival of death is not a natural consequence of its immateriality or simplicity, but is rather a miracle, a special gift from God; that existing without a body is not a good thing for the soul, an essential part of the *telos* of which is to animate a body; and that the life of the 'spiritual' or 'glorified' body that the saved soul will be given at the general resurrection will be qualitatively different from (and superior to) the life of the soul's first or 'natural' body. (It must be emphasized that, whatever 'spiritual body' may mean, it does not mean 'immaterial body'.)

2 Philosophical difficulties

Each of these metaphysical theories of resurrection faces philosophical problems. Believers in resurrection who are dualists face the problems any dualist faces (see Dualism). Since these problems are the same whether or not the dualist believes in resurrection, they will not be discussed here. Believers in resurrection who are materialists (as regards human beings) face the problems any materialist faces (see Materialism in the philosophy of mind). Since these problems are the same whether or not the materialist believes in resurrection, they will not be discussed here. In addition, however, believers in resurrection who are materialists face a special philosophical problem about personal identity. The remainder of this entry will discuss this special problem.

It can be plausibly argued that the doctrine of the resurrection of the dead presupposes some form of dualism. For if human persons are not immaterial souls, if they are living animals, then it would seem that death must be the end of them. A living animal is a material object. A material object is composed, at any given moment, of certain atoms. But if one is composed of certain atoms today, it is clear from what we know about the metabolisms of living things that one was not composed of those same atoms a year ago: one must then have been composed of a set of atoms that hardly overlaps the set of atoms that composes one today - and so for any living organism. This fact, the fact that the atoms of which a living organism is composed are in continuous flux, is a stumbling block for the materialist who believes in resurrection.

Suppose, then, that God proposes to raise Socrates from the dead. How shall he accomplish this? How shall even omnipotence bring back a particular person who lived long ago and has returned to the dust? - whose former atoms have been, for millennia, spread pretty evenly throughout the biosphere? This question does not confront the dualist, who will say either that there is no need to bring Socrates back (because, so to speak, Socrates has never left), or else that Socrates can be brought back simply by providing his soul (which still exists) with a newly created human body. But what will the materialist say? From the point of view of the materialist, it looks as if asking God to bring Socrates back is like asking him to bring back the snows of yesteryear or the light of other days. For what can even omnipotence do but reassemble? What else is there to do? And reassembly is not enough, for Socrates was composed of different atoms at different times. If someone says, 'If God now reassembles the atoms that composed Socrates at the moment of his death, those reassembled atoms will once more compose Socrates', there is an obvious objection to the thesis. If God can reassemble the atoms that composed Socrates at the moment of his death in 399 BC - and no doubt he can - he can also reassemble the atoms that composed Socrates at some particular instant in 409 BC. In fact, if there is no overlap between the two sets of atoms, God could do both of these things, and set the two resulting men side by side. And which would be Socrates? Neither or both, it would seem, and, since not both, neither.

It might be objected that God would not do such a frivolous thing, and this may indeed be so. Nevertheless, if God were to reassemble either set of atoms, the resulting man would be who he was, and it is absurd, it is utterly incoherent, to suppose that his identity could depend on what might happen to some atoms other than the atoms that composed him (for this is what a materialist who holds that the reassembled '399 BC' atoms compose Socrates just so long as the '409 BC' atoms are not also reassembled is committed to). In the end, there would seem to be no way round the following requirement: if Socrates was a material thing, a living organism, then, if a man who lives at some time after Socrates' death and physical dissolution is to be *Socrates*, there will have to be some sort of

material and causal continuity between the matter that composed Socrates at the moment of his death and the matter that at any time composes that man. (St Paul seems to suggest, in the passage from 1 Corinthians cited above, that this will indeed be the case.) But 'physical dissolution' and 'material and causal continuity' are hard to reconcile. To show how the continuity requirement can be satisfied, despite appearances - or else to show that the continuity requirement is illusory - is a problem that must be solved if a philosophically satisfactory 'materialist' theory of resurrection is to be devised.

Revelation

All major theistic religions have claimed that God has revealed himself in some way, both by showing something of himself in events and also by providing some true, important and otherwise unknowable propositions. Event-revelation may include both general revelation (God revealing himself in very general events, observable by all, such as the existence of the universe and its conformity to natural laws), and special revelation (God revealing himself in certain particular historical events). The events are a revelation in the sense that God has brought them about and they show something of his character. Thus Judaism teaches that God manifested his nature and his love for Israel when he brought his people out of Egypt and led them to the promised land through the agency of Moses. Christianity traditionally affirms that God has revealed himself in a much fuller sense in Jesus Christ - because Jesus did not merely show us something of the character of God but was God himself. God reveals propositions by some chosen prophet or society telling us truths orally or in writing which we would not have adequate grounds for believing unless they had been announced to us by persons who showed some mark of God-given authority. Thus Islam teaches that God inspired Muhammad to write the Qur'an *in the seventh century* AD*, and that its success (its proclamation throughout a large part of the civilized world), content and style (deep thoughts expressed in a beautiful way, not to be expected of an uneducated person) show its divine origin.*

1 Event revelation

Any event brought about by an agent reveals something of that agent's character. If God made the world, one would expect its general character to show something about its Creator. The prophet Jeremiah represented God as speaking of his 'covenant of day and night', the regular succession of day after night and night after day, as showing the reliability of God and providing a reason why his solemn undertakings should be believed (Jeremiah 33: 20-6). Some recent writers have seen the focus of God's general revelation as the general progress of humanity in its understanding of the world and moral truth and in its working together for the advancement of all the human race. Most theologians have believed in special, as well as general revelation. But some recent 'neo-orthodox' Christian theologians, inspired by Karl Barth (§2), have held that God does not reveal himself in any comprehensible way in the natural world or secular history - he is too 'other' and too different from such things. By contrast, the eighteenth-century deist movement denied that God had manifested his presence in some historical events more than others; and this spirit has been in evidence in much recent liberal Christian theology (see Deism). It has been characterized by a denial that Christianity is in any unique way the true religion and so has held that if some events manifest God's nature more than others, they include events within the histories of all the great religious traditions and secular cultures. This is contrary to unanimous Christian tradition from the first to the eighteenth century, that God has manifested his presence pre-eminently in Christian history and above all in Jesus Christ (see Incarnation and Christology §1).

If one has any reason to believe that there is a God, one would expect the natural world to reveal to some extent what he is like. Only if one has other beliefs about what God is like would one deny this; and those other beliefs would require justification. Why believe that certain historical events reveal God better than others? Perhaps reason, and in particular our understanding of moral goodness, might lead us to see that if God is at work in the world, he is at work in some places more than others. Our private religious experience or the miraculous nature of the special events might also show us this. But if one allows general as well as special revelation, one can learn something about what God is like from the natural world; one can then use that to recognize in which particular events God was at work and, by reflecting on them, gain more knowledge of him.

Theistic religions have generally maintained that God manifests his presence not merely publicly in the natural order or in events within human history, but privately to particular individuals. But such events, except when they involve the conveying of information, are more naturally called religious experiences than instances of revelation.

If God reveals himself in particular events of human history and these are events of significance for the human race, then if later generations are to benefit from them, they will presumably need to know about them. Some Scripture or Church proclamations will presumably be needed. Many twentieth-century theologians have been unwilling to regard such written records - for example, the Bible - as themselves items of revelation. Barth preferred to call them 'witnesses' to revelation. Such theologians have regarded the scriptural texts as not always

true but as useful and inspiring signposts to what is true. Earlier Christian centuries generally regarded the Bible as containing only truths, some reporting significant historical events, others conveying God's commandments and truths about his nature.

2 Propositional revelation: its grounds

The major theistic religions have all held that God has revealed certain propositions, which are incorporated in written works. For Christians, they are in the Bible; for Jews, in the Hebrew Bible (known to Christians as 'The Old Testament' of their Bible); for Muslims, in the Qur'an. Why should anyone believe this?

As most theologians have supposed, there must be two kinds of relevant evidence. The first is the consonance of the propositions purportedly revealed with what is known by other routes of the nature of God (including the evidence of other propositions purportedly revealed). God is supposed, by definition, to be morally good. If the purportedly revealed propositions commend what is not morally good, they cannot be the commands of God (see Religion and morality §1). Again, God is supposed to be non-embodied and omnipotent (and natural theology claims that arguments from the natural world show this). If the propositions purportedly revealed speak of God having arms and legs, and being unable to do various actions, they cannot be revealed.

But if the propositions are to reveal anything to us, they must go beyond our prior knowledge while remaining consonant with it. Why believe one rather than another claim consonant with prior knowledge? The normal answer is that the purported revelation is accompanied by miracles, events contrary to natural laws, which, since God keeps natural laws operative, God alone could bring about (see Miracles). Miracles are thus the second kind of relevant evidence. If the miracles produce or forward the teaching of a purportedly revealed book, that is reasonably understood as an act of God (like a nod or a signature) authenticating that teaching. The major theistic religions have all claimed evidence of this sort for their revealed documents. The Qur'an was to be recognized as of divine origin by its 'inimitability' - it was a document of a kind that an uneducated person could not have written unless God had intervened to give him knowledge and literary ability beyond his education. The Hebrew Bible was to be recognized as of divine origin because it was the record of miraculous events (such as the parting of the Red Sea) and of the people founded as a result of those events. The Christian Bible was to be recognized as of divine origin because it was founded upon the resurrection of Jesus from the dead and other miracles which accompanied the foundation and growth of Christianity. That miracles are vital to authenticate claims to revelation was the normal teaching of Christian theologians, at least until the last century or two, when many have tried to dispense with any appeal to the miraculous.

Analogy with human cases explains why we look for these two kinds of evidence. If I receive a letter purportedly from John, my grounds for believing it to come really from John are first, that everything written in it is the sort of thing John could be expected to write; it is in character and shows knowledge of our previous meetings. And, second, it is written in a way or comes by a route that letters from John, and very few others, alone would do. Thus it may be that the handwriting is almost exactly like previous specimens of John's handwriting, and very few others can write in that way. Or it may be that the letter is given to me by a friend who says that John gave it to him, a friend whom in the past I have found to be completely trustworthy. The two kinds of evidence are sometimes called respectively internal and external evidence of authorship. We rightly look for both kinds of evidence of the divine authorship of purportedly revealed propositions.

A private religious experience had by the prophet writing the teaching down could perhaps provide him with the requisite authentication; and quite a few Christian writers, especially Protestants, have stressed the importance of the inner conviction that God is speaking to us through the text as grounds for believing its truth. But in view of the conflicting revelations purportedly inspired by God to which 'inner conviction' has seemed to testify, and the danger of self-deception in such matters, it would be dangerous for those other than the prophet to rely too much on inner conviction to authenticate such detailed claims about God as a revelation purports to give. There is need for public miracles.

How are you to know that a purported miracle took place and was indeed a miracle? We need to have evidence that if the event in question took place, it would have been contrary to natural laws; for example, that if the Red Sea parted in the way described in Exodus, that could not have been produced by natural processes of wind and tide operating normally. We also need evidence that the event in question took place. Evidence that some event

took place will always include both historical evidence of its purported effects - testimony of witnesses and any physical traces of its occurrence - and also evidence from any well-authenticated general theory of how likely such an event is to occur. The more evidence we have from overall theory that a certain kind of event is likely to happen some time or other, the less we need in the way of detailed historical evidence to show that it has happened. If your theory of astronomy leads you to suppose that sometimes stars will explode, then it is reasonable to interpret what you see through your telescope as the debris of a stellar explosion. The better justified your overall theory, the better justified your interpretation of the data. But if a well-justified theory tells you that these things cannot happen, then you need a great deal of detailed historical evidence to outweigh the countervailing theory. Similarly, the better established is theism, and the better established is the view that God has reason to intervene in history, the less you need by way of historical evidence to show that he has done so (see Atheism; God, arguments for the existence of). We must consider here whether if there is a God, he has reason to give us a revelation and so to authenticate it by miracle. If so, we need less in the way of detailed historical evidence to show that he has done so.

Some have supposed revelation to be unnecessary, since reason or natural theology can show us what God is like and which acts are morally good or bad, and that is all we need to know. The theistic religions have, however, generally claimed that while natural theology can show us quite a bit, there is also a lot that it cannot show us and that we need to know in order to have the right relation to God and to live the right sort of life on earth. St Thomas Aquinas (§14) in particular claimed that while natural theology can show us God’s existence and the most general moral truths, we need revelation to show us in much more detail what God is like (*Summa contra gentiles* I, chaps 2-13). Revelation also fleshes out our general duty of conformity to the will of God, by showing us, for example, that God wills us to worship him in particular ways on particular occasions. Even with respect to the former truths which, Aquinas claims, reason can discover, many humans may simply not have the time and ability to discover them; and revelation could also inform us about them. It is plausible to suppose that if there is a God, he wants us to know a lot more about him than pure reason can discover in order to enter into a personal relationship with him. And if he has provided some sort of community and institutions to help us to do this, he will need to inform us. The Catholic tradition has generally followed Aquinas, and seen Christian faith as involving the acceptance of the Christian revelation. The First Vatican Council (1870) declared that faith is a supernatural virtue whereby ‘we believe that what has been revealed by God is true’.

But if God dictates a book, it may get destroyed or misinterpreted, and with the passage of centuries any book can get badly misinterpreted. So it is plausible to suppose that a propositional revelation would need to be backed up by the provision of an institution or tradition of interpretation itself based on a miraculous foundation, which authenticated the book and its subsequent interpretation. Both Islam and Judaism have claimed that there are authorized interpreters of revelation. Catholic and Eastern Orthodox Christianity claim the Christian Church to be such a divinely authorized interpreter; and even many Protestants have held that the Christian tradition in a wide sense is a divinely guided tradition for interpreting the Bible.

3 Propositional revelation: its content

How is the Qur’an or the Hebrew Scriptures or the Bible to be interpreted? The Qur’an was written down at the dictation of a single human author, Muhammad, allegedly inspired by God. The Hebrew Scriptures were a collection of books compiled over many centuries, having different human authors; and the Bible was put together over even more centuries with even more human authors. How these Scriptures are to be interpreted depends on the genres to which we suppose their various parts to belong.

There are many kinds of literary genre: history, historical novel, narrative poetry, philosophical dialogue, science fiction, moral fable, and so on; and there are many genres known to the ancient world which are unfamiliar today, such as wisdom literature, apocalyptic, allegory, and Greek tragedy. They differ in various stylistic respects, and above all in the respect of whether they have a truth-value. Furthermore, in varying ways, for some but not all genres the truth-value of the whole is a function of the truth-value of the component sentences. Thus a newspaper story is true to the extent to which its component sentences are true. The whole is more or less true according to how many of the component sentences are true, and even the truth of individual sentences may be a matter of degree; some sentences may be only approximately true. By contrast, a simple modern novel is neither true nor false. But literary works may also have a true message, even though that is not a matter of having most of their

sentences true. Poems or fables, such as Aesop's fables, often tell us things deep and important about human nature or moral worth by means of fictional stories (about historical or non-existent persons), each of whose sentences taken on its own is false or lacks a truth-value.

So in interpreting an ancient work, purportedly revealed, we need to inquire about the genre of the whole and the way in which it affects the genre of the constituent books. Is, for example, the Book of Jonah, a constituent of the Hebrew Scriptures and the Bible, to be taken as straight history or as a moral fable? Our judgments about the genre of a work (and so how its sentences are to be interpreted) must depend on our judgments about who is the author and who are the intended audience. For the authorship of the Qur'an, there are only two possible candidates - Muhammad (if he was not inspired by God) and God. For the Bible, there are very many candidates, for the Bible is a patchwork; small passages written by one human author or group were put together into larger strands and then into 'Books', and those eventually into the whole Bible. Passages may have one meaning when written by one author on their own, a different meaning when used as part of a larger work by another author, and so on. Thus the central part of the Book of Ecclesiastes is an atheistic work, but this was sandwiched by another author within chapters having a theistic tone, which - if you think of the work as a whole - leads to reinterpretation of the central parts; the later author having taken over the central chapters, they must be interpreted as having a meaning consistent with the other chapters.

The document of revelation is, for Jews, the Hebrew Scriptures; for Christians, their whole Bible, Old and New Testaments. The Christian Church promulgated that work as having a central core, condensed into the Christian creeds, in the light of which the whole must be interpreted. It declared that Scripture was totally true and that God was the author of the Bible. It was meant for one Church of many centuries. What is the genre of the Bible? There is little with which to compare it. But there is one obvious principle of interpretation: that, like any other work, it must be interpreted in the light of other things we know about the author's beliefs. Hence there grew up in the Christian Church a tradition of biblical interpretation, first stated explicitly by Origen (§2), and continued in many writers of the first 1500 years AD: that passages are to be taken literally (as well, perhaps, as in other senses) where that is consonant with other things known about God, both through natural reason and as part of the central core of Christian revelation, and otherwise they are to be taken only in figurative senses (see Origen's *On First Principles*, 4.3). This led to books and passages of the Bible being interpreted in analogical, allegorical or metaphorical ways. For example, any passages at variance with the best science of the day or suggesting that God had a body were not to be taken literally; much in the early chapters of the book of Genesis needed to be taken in figurative senses.

What then is at stake with respect to any purported propositional revelation is whether the evidence of its content and any accompanying miracle suggests that God is its author and so that it is a genuine revelation. Competing claims to provide a revelation must be weighed against each other. But in judging what the content of a purported revelation is, the inquirer must do so on the assumption that God is its author.

Revolution

There have been revolutions in politics, science, philosophy and most other spheres of human life. This entry discusses revolution mainly through concepts pertaining especially to the political realm. Attempts to define political revolution have been controversial; as a consequence there is dispute about whether specific occurrences were revolutions, rebellions, coups d'état *or reformations.*

If we define revolution as the illegal introduction of a radically new situation and order for the sake of obtaining or increasing individual or communal freedom, we may list those characteristics most often ascribed to it. These characteristics distinguish it from its earlier use where revolution referred to the return of an original state of affairs, as in astronomy; they also allow its distinction from related concepts such as reformation. At least at a superficial level this definition can do justice to early modern (seventeenth and eighteenth) as well as late modern (nineteenth and twentieth century) revolutions. Through these periods there has, however, been sufficient change in concepts closely related to revolution to require the definition's openness to nuances for it to apply to both periods. It is unclear whether even such a nuanced definition can apply in postmodern thought.

1 Related concepts

Revolution should be distinguished from *reformation*, *rebellion* and *coup d'état*. *Coup d'état* refers to attempts to change the rulers of a system, often with the intent of making more accessible or changing the benefits derivable from that same system; and rebellion indicates attempts to redress specific grievances within a particular system without necessarily a change of that system's leadership. Reformation denotes events potentially more extensive than either of these; it aims at general overhaul by insisting that pre-existing fundamental norms judge both rulers and systems. If a system is not structured by these norms and its rulers refuse their implementation, reformers take it as their task to change the system to conformity, if necessary against the rulers' wishes. Not infrequently, one result is a split in the system, with part remaining unreformed under the old leadership and part claiming successful confirmation of old norms under new leadership. Revolution designates events more radical than any of these; its intent is not modification but uprooting and transformation.

To clarify the difference between reformation and revolution, consider two events whose traditional labels correctly mark it: the early sixteenth-century Lutheran Reformation and the late eighteenth-century French Revolution. Although they share their stress on the individual and its concomitant rejection of certain kinds of authority, there are profound dissimilarities reflecting an essential distinction.

Notwithstanding Luther's stress on individuals in his rejection of the church's mediating role between individual and God, he insists primarily on extrapersonal unchanging norms - revealed by God and codified in the Scriptures - which are to judge both church and individual. Since he believed these norms no longer characterized institutional and individual practice, their practice needed re-formation in order to restore institutional legitimacy and secure the individuals' justification. Underlying Luther's slogan 'through faith alone' is the requirement that we should return to intended and traditional ways. Equality before God includes equal individual responsibility for implementing God's unchanging edicts (see Luther).

Of the French Revolution's slogans 'no God, no master' and 'freedom, equality, brotherhood', the first demands extirpation of all external religious and secular hierarchical power, while the second indicates the outcome of heeding that call. Liberation from divine and royal edicts enfranchises a common humanity expressed through each free and equal individual. The norms which are to structure life now find their source in each individual's reason; and the assumed commonality of human nature, including reason's universal sameness, guarantees the uniformity and authorizes the universally compelling force of these rules. The Revolution meant to effect a total reversal: institutions sanctioned in the past through extra-individual powers are found wanting when judged by new norms demanding a new order derived from its subjects.

This comparison distinguishes reformation from revolution through their different radicalism. Whereas reformers return to roots, insisting that institutions and actions conform to root situations, revolutionaries pluck up and discard roots. Reformers reinstitute old norms, revolutionaries establish new ones. When they aim to re-establish a quite probably mythical past golden age, reformers are appropriately called 'utopian reactionaries'. In contrast to

reformers, revolutionaries are anti-tradition in their suspicion and rejection of whatever their cultural present or past would have them accept on trust.

Both rebellion and *coup d'état* can function in reforming and revolutionary movements. Rebellions may occur when a reforming movement's leadership is deemed to effect change too quickly or too slowly, or to aim at reinstitution of the wrong norms. If the leadership resist the rebels' demands a coup may follow - although often not, strictly speaking, a *coup d'état*, since the leaders of a reformation need not be leaders of a state. The success of a *coup* allows for continuing reformation at a different pace or in a different direction. Similarly for revolutions: rebellions or coups are then not themselves revolutionary to the extent that the revolution is already under way; rebels then demand a change of pace or of direction (that is, new ideals different from those pursued by the current leadership). If the current revolutionary leadership rejects such demands a *coup* may follow. Regimes that revolutionaries want to depose seldom leave quietly; revolutions tend to be violent events. Similarly for *coups* within revolutionary movements: of the French Revolution it was said that it devoured its children.

2 Defining characteristics

The definition introduced above contains three characteristics of revolution: (1) radical novelty, (2) illegality, and (3) freedom. These three are both essential and most frequently present in writings on revolution, and will remain focal.

Radical novelty is generally seen as fundamental to revolution; both illegality and freedom presuppose it. Writers speak of revolution as involving 'drastic substitution', 'fundamental change', 'the speaking of a new, unheard of language, another logic, a revaluation of all values', a change 'affecting the fundamental laws' and expressing itself in 'radical transformation' (Brinton 1952; Friedrich 1966). This radical novelty as fundamental change makes revolutions typically modern phenomena. Pre-modern times accepted a transcendent reality (as in the Greeks' Platonic Good or the Medievals' Christian God) which characteristically imposed eternally and universally binding norms for human institutions and actions. The appearance of revolutions coincides with the irrelevance (at least in principle) of the transcendent in some of the most important events of human history.

Not all alteration of fundamental laws or constitutions is illegal; constitutions often include directives for their legal amendments. Revolutionary change is illegal change of fundamental laws, unconstitutional change of constitutions. Because revolutionary change is meant to be sweeping and fundamental, it intends to remove whatever opposes it which is, primarily, the current order. Since the order to be instituted is radically different from the order it means to replace, the latter contains no provision for sanctioning the former.

Revolutions occur for the sake of promoting human freedom (Arendt 1963). This freedom is both positive and negative, freedom from a current order creating room for freedom to institute a new order. The pertaining order is always seen as constricting, its revolutionary abolition as enfranchising, the new order as guaranteeing greater freedom. Like illegality so also is freedom intrinsically connected with radical novelty: what is completely swept away has lost all power to prevent the revolutionaries' establishment of their new order. Freedom is connected, as well, with passion, for revolutionaries are persons chafing under constraints which they want removed; they are driven by anger about the present, confidence in the possibility of progress and hence hope for a better future. Passion precipitates revolutions, while reason serves as an instrument to direct both liberating activity and the establishment of new freedom.

3 Revolution and reason

An intimate relationship between revolution and reason in the early modern period raises the question whether a single definition of revolution is possible given changing views of the nature and role of reason as we move from this period through historicism into postmodernism (see Historicism; Postmodernism).

Influential early modern thinkers took reason to dictate the revolutionary stance of plucking up and discarding roots. Descartes was the first to present this stance as integral to all systematic thinking. In his *Discourse on the Method* (1637) reductionistic reason dictates non-acceptance of whatever experience initially provides as true or good unless the individual is able to free such items from their given contexts and then fit them into a new rational scheme. His *Meditations* (1641) provide the new foundation for this rational scheme in the activity of the individual's autonomous thought. Descartes's project displays all the major characteristics of revolutionary

activity: it opposes predominant systems of his day which upheld the absolute necessity of tradition and so could not possibly legitimate its uprooting; it introduces the radical novelty of locating the criteria of truth in each individual thinker; its initial rejection of all givens aims to free thinkers from historical contexts to enable their progress in knowledge, power and freedom. In the following century figures important to the French Revolution spoke of Descartes as their precursor in breaking the tyranny of tradition.

With Hegel (§8), Marx (§8) and Engels, historicism, for which anything must be understood in its past-dependent changing context, becomes part of the Western outlook. Marx and Engels therefore locate initiating revolutionary force in material and economic conditions rather than in persons no longer characterized by reductionistic reason. *The Communist Manifesto* (1848) states as conditions for revolution: exploitation of the suppressed class to the degree that it understands and becomes ready to shake off institutional shackles; and incapacity of the oppressors to continue exploitation competently. Both conditions appear through the historically inexorable development of class antagonism under changing forms of economic production. Reason still has a place - revolution is a rational attempt by the oppressed to achieve change - but economic forces expressed as macro-historical laws are primary in determining the possibility of revolutionary activity. Economic forces, argues *The German Ideology* (1846), cause changes in material production and alter the oppressed's thinking and products of their thinking so that, generally, it is not thought which determines life but life which determines thought. Nevertheless, chief characteristics of the earlier definition remain. The socialist revolution is seen as introducing novelty greater than that of the French Revolution, for it will abolish classes as well as the old division of labour; it will certainly be illegal in the eyes of both oppressors and oppressed, for it will annul the oppressing legal system and thereby progress towards new forms of freedom.

Postmodernism considers itself free from all forms of modern rationality; in its rejection of both reductionistic and holistic past narratives it embraces epistemic, moral and cultural relativism. Consequently, postmodernism neither advocates a particular political stance nor identifies an overarching cause for revolution (see Postmodernism in political philosophy §2). It rejects 'the *foundational* character of the revolutionary act, the institution of a point of concentration of power from which society could be "rationally" reorganized' (Laclau and Mouffe 1985: 177; original emphasis). Nevertheless, the term revolution is ubiquitous in its political, sociological and artistic writings and 'revolutionary' now conveys no less praise than during late-modernity's struggles for liberation. But can revolution retain any of its modern content given a radical diversity of values? Are the dislocated selves of postmodernity still capable of deliberate revolutionary activity in a relativistic culture? Or is it only possible to rebel against contingent structures, or perpetrate *coups* at best resulting in transfer of control from one group to another without a fuller realization of individual or communal freedom?

Modernity's revolution became possible given its concepts of rationality, freedom, radical novelty and progress, where at least some of the meaning of these terms carried over from its earlier to its later phase. Postmodernity's questioning the meaning of each of these terms makes the univocal use of revolution more problematic when we move from modernity to postmodernity than from early to late modernity.

rGyal tshab dar ma rin chen (1364- 1432)

rGyal tshab dar ma rin chen (Gyeltsap darma rinchen) was a disciple of the great Tsong kha pa. Like much Tibetan philosophy, his work is commentarial in style. In his commentaries on the work of Dharmakīrti he developed a moderate realist position with regard to abstract entities, claiming that this was what Dharmakīrti (apparently an antirealist) really intended. Properties, rGyal tshab maintained, do exist, but not independently of things; universals are separable from particulars in thought, but never in perception. Perception straightforwardly presents us with real objects; inference, on the other hand, tends to present reality in a distorted way.

rGyal tshab dar ma rin chen (Gyeltsap darma rinchen) was one of the foremost disciples of Tsong kha pa Blo bzang grags pa (Dzongkaba, 1357-1419), the founder of the dGa'-ldan (Ganden) school, later known as dGe-lugs-pa (Geluk). rGyal tshab was born in Western Tibet at Ri-nang and moved to Sa-skya, where he acquired a solid scholarly reputation prior to meeting Tsong kha pa. He became one of Tsong kha pa's closest disciples. After his teacher passed away, rGyal tshab succeeded him to the throne of dGa'-ldan monastery.

Even more than other Tibetan thinkers, rGyal tshab discusses classical problems both on the basis of their philosophical merits and in relation to, and under the form of, commentaries on basic texts formative of the tradition. He does not examine philosophical propositions independently of the traditional framework, but always examines other systems from within his own and defends or develops his own from within. This he sees as responsible philosophizing, as distinguished from irresponsible sophistry. rGyal tshab offers a number of clear expositions of important Buddhist commentaries omitted by his master, and among his commentaries those elucidating the texts of Maitreya and Dharmakīrti are his greatest contributions.

A peculiarity of the way rGyal tshab interprets Dharmakīrti's epistemology is that he presents a realist version of a system that is fundamentally antirealist. Although Dharmakīrti (§2) describes universals as unreal conceptual constructs, rGyal tshab does not accept this description as representing Dharmakīrti's true thought. Following a realist tradition of interpretation that goes back to at least Phya pa chos kyi seng ge (Chaba chögyi sengge, 1109-69), rGyal tshab holds that Dharmakīrti's many passages that seem to reject universals must be reinterpreted, for they lead to unacceptable philosophical consequences.

rGyal tshab's position is a form of moderate realism. Like its Western counterparts, it is born from the attempt to find a middle ground between the extreme realists and the antirealists. Moderate realists are sympathetic to the antirealist's rejection of the extreme realist assertion that properties exist independently of the particulars that instantiate them. They are unwilling, however, to take the next antirealist step, namely the complete rejection of abstract entities. If abstract entities were totally dependent on our conceptual schemata, as argued by the antirealists, our concepts would be arbitrary. To avoid this unwanted consequence, moderate realists hold that we must admit that properties exist independently of the mind. This does not mean, argue the moderate realists, that they exist independently of their instances. How, they ask, can properties exist without any support in empirical reality? Consequently, moderate realists hold that universals exist in things (see Abstract objects).

The problem with this position is that it makes it difficult to spell out the relation between universals and their instances. Since they do not exist apart, they cannot be different. And yet they cannot be identical either, since the former are not reducible to the latter. rGyal tshab and his tradition respond to this predicament, which seems inherent in moderate realism, by positing a new type of relation: particulars and universals are described as being distinct and yet the same entity (*ngo bo gcig la ldog pa tha dad*). Suffice it to say here that, for rGyal tshab, particulars and universals are distinct because they can be separated by thought. Hence they can be thought of as apart, but, since they cannot be taken apart by perceptual experience, they are the same entity.

Epistemologically, the consequence of rGyal tshab's realism is that he presents a picture of perception that differs markedly from that of Sa skya Paṇḍita (Sagya paṇḍita, 1182-1251). For rGyal tshab, perception presents us with a fully fledged common-sense object. When we perceive, for example, a jar, we do not merely sense a presence that we interpret as a jar. Rather, we directly see the object as being a jar. This common-sense account of perception is possible for rGyal tshab because of his acceptance of real universals. Because they exist in reality, perception, which accurately reflects reality, can perceive them and deliver a cognitively articulated vision of reality.

A similar realist streak is present in rGyal tshab's account of inference. He accepts that conceptual cognition in general, and inference in particular, are distorted. They do not apprehend the object as it is. This does not mean, argues rGyal tshab, that they are totally mistaken, as antirealist interpreters wrongly assume. Conceptuality should not be thought of as being cut off from reality, but rather as putting us in touch with reality, albeit in an indirect and distorted way.

Rhetoric

Rhetoric is the power to persuade, especially about political or public affairs. Sometimes philosophy has defined itself in opposition to rhetoric - Plato invented the term 'rhetoric' so that philosophy could define itself by contrast, and distinctions like that between persuasion and knowledge have been popular ever since. Sometimes philosophy has used rhetorical techniques or materials to advance its own projects. Some of its techniques, especially topics of invention, the classification of issues, and tropes or figures of speech, are occasionally employed by philosophers. The philosophical question is whether these techniques have any interest beyond efficacy. What is the relation between techniques effective in persuading others and methods for making up one's own mind? Is there any connection between the most persuasive case and the best decision? Is there a relation between the judgments of appropriateness and decorum exercised by the rhetorician, and the judgments of appropriateness exercised by the person of practical wisdom? Do judgments about probability, ambiguity and uncertainty, and judgments under constraints of time or the need for decision, aspire to the ideal of perfect rationality, to which they are doomed to fall short, or do these kinds of judgment have an integrity of their own?Apart from supplying useful techniques, an art of persuasion also raises philosophic questions concerning the relation between rhetoric and logic, rhetoric and ethics, and rhetoric and poetics.

1 Philosophy and rhetoric at their beginning

Plato invented the term 'rhetoric' as a contrast term against which philosophy could define itself. Philosophy and rhetoric both proposed new truths and apparently powerful methods that threatened existing moral codes and authorities. As modes of empowerment, self-making and self-consciousness they could as easily become enemies as allies. Thus while philosophy attempted to achieve self-consciousness and power through an awareness of thought and being, rhetoric focused on an awareness of language and the circumstances of speaking and acting. Cicero interpreted the Platonic separation of philosophy from rhetoric as that of Socrates dividing wisdom from eloquence, and saw that the task of philosophical rhetoric was to overcome this separation. Prior to Socrates, he says in *de Oratore*, 'the same teaching seems to have imparted education both in right conduct and in good speech…the same masters gave instruction in both ethics and rhetoric' (see Cicero §§1, 2). From the beginning, then, rhetoric already had the pejorative connotation it continues to have, in spite of periodic attempts to speak in its defence.

Rhetoric's importance for philosophy seems greatest in periods of political and cultural confrontation and pluralism, for example, during Roman expansion, the Renaissance and today. These are all times of 'linguistic turns' in philosophy and, in addition, of fruitful interactions between philosophic and legal argumentation and interpretation. Linguistic, legal and pragmatic turns are rhetorical phenomena that direct attention to effective reasoned communication. In such times, the revival of rhetoric is motivated by a sense that philosophy itself has become too professionalized and too remote from human concerns. Rhetoric is then invoked, as in Cicero, to bring philosophy back down to earth. That neither Rome nor the Renaissance is considered a golden age of philosophy is probably a reflection of their rhetorical character.

Whether or not the history of philosophy is a series of footnotes to Plato, the history of the philosophical issues of rhetoric certainly can be read that way. The *Gorgias* begins by showing the difficulty in defining rhetoric. Gorgias finds it hard not only to define rhetoric logically, but to offer a definition in the more serious sense of keeping it within its proper sphere. In Socrates' hands the universality of rhetoric becomes a sign of emptiness, not power, and its flexibility turns from resourcefulness into slavishness. The conversation between Socrates and Polus make this philosophy of rhetoric the first example of 'applied ethics', in which one searches for ethical constraints on an activity. The conversation between Socrates and Callicles originates the tradition of 'professional ethics' which relates the internal norms of a practice to the sort of person the practitioner is.

Other Platonic dialogues amplify these considerations and raise further questions. The same rhetoric that appears in the *Gorgias* as a power of domination appears in the *Protagoras* in a context of mutual agreement. The most obvious use of rhetoric - arguing both sides of a question - can be either to exercise power unilaterally or to provide the basis of community, just as competitive Homeric virtues either underlie or are transformed into the cooperative virtues of the polis. In the twentieth century, Kenneth Burke (1950) highlights this shift by changing

the central occupation of rhetoric from persuasion to 'identification'. The relation between the competitive and cooperative facets of rhetorical argument sets another philosophic problem for rhetoric: Under what conditions can the power to argue both sides of a question become the power to uncover truth through the free competition or marketplace of ideas? (In *On Liberty*, Mill develops his vision of truth emerging through controversy by reference to Cicero, 'the second greatest orator in antiquity'.) The introductory conversation in the *Protagoras* between Hippocrates and Socrates raises questions about the relation between learning from the sophists and being a sophist oneself. The dialogue then presents Socrates in conversation with the sophists Protagoras, Hippias and Prodicus. Protagoras limits the domain of rhetoric to political questions, justice and civic virtue, while Hippias would expand it to cover the natural sciences, and Prodicus would extend it to literary interpretation. Whether rhetoric is restricted to political questions, whether there is a 'rhetoric of science' or further uses of rhetoric outside politics all become standard questions for rhetoric from then onwards.

The *Phaedrus* turns to a third possible alliance which defines rhetoric in relation to poetics. In addition to rhetoric and logic (what does the rhetorician know?) and rhetoric and ethics (what are the uses and abuses of this power, and what sort of person does one become in practising rhetoric?) there is the relation between rhetoric and poetry, another activity that either employs charms not available to more rational approaches or operates at a further remove from reality. The *Phaedrus* raises further questions concerning the relation between written and spoken language, and so between the production and reception of discourse, a line of investigation that eventually leads from rhetoric to hermeneutics. Questions from the *Gorgias* concerning rhetoric and knowledge are formulated in the *Phaedrus* in a pointed manner as the relation between rhetoric and sincerity and deception, or between persuasion, *eros*, beauty, and seduction. Burke's investigations of the relations between serious and playful uses of language are a modern rediscovery of this set of questions, as are the recent revivals of rhetoric in de Man and Derrida.

The *Phaedrus* ends with Socrates asking whether there is a rhetoric for philosophy - that is, whether there are modes of communication that are especially suited for philosophy. But Socrates' questions about written versus spoken language, and long speeches versus questions and answers, at the same time pose the parallel problem of whether rhetoric has a philosophy, whether it has ethical or metaphysical commitments. The answer is parallel to that for the analogous question about mathematics: does the mathematical enterprise inherently have a 'philosophy'. There seems to be a natural affinity between mathematics and one type of philosophy, namely Platonism. On the other hand there are as many philosophies of mathematics as there are types of philosophy. Similarly, there are affinities of rhetoric with scepticism and relativism, and there are as many philosophies of rhetoric as there are kinds of philosophy (see Plato §§4, 5).

2 Philosophical problems posed by rhetoric

Rhetoric is persuasive communication, especially about practice and politics. Whether rhetoric is a subject for philosophy depends on whether persuasion raises issues of its own apart from those exhausted by logic, ethics and psychology. If the way people were persuaded had nothing at all to do with logical cogency or ethical responsibility, or if it was simply reducible to one of them, there would be nothing philosophic about rhetoric. It is only because there seems to be some connection between logical cogency and rhetorical persuasiveness, between the trust accorded a persuasive speaker and the confidence we have in good ethical agents, and between figurative language and something more than mere ornament, that rhetoric is a subject for philosophy. While rhetorical theory has had negligible influence on the history of philosophy, the problems raised by rhetorical practice are significant philosophical problems.

All the issues raised by Plato's dialogues could have become philosophical problems in a variety of ways, but they were disciplined by Aristotle's organization of knowledge. The details of Aristotle's *Rhetoric* have had little impact on the history of either philosophy or rhetoric, but his placement of rhetoric relative to other arts and sciences has organized the trajectory of the relation of philosophy and rhetoric. Rhetoric, he says, is the offshoot of dialectic and politics. There are three ends and kinds of rhetoric: political or deliberative rhetoric directed towards utility; judicial or forensic rhetoric which determines justice and injustice; and epideictic or demonstrative rhetoric which concerns worthiness and blameworthiness. There are three sources of persuasion or belief (*pistis*) in rhetoric - the character (*êthos*) of the speaker, the passions of the audience, and the 'speech (*logos*) itself, in so far as it proves or seems to prove' - generating the trio implicit in Plato: rhetoric and logic, rhetoric and ethics, rhetoric and

poetics.

The meaning and scope of all these terms of opposition (logic, ethics and poetics) shifts as the domain of rhetoric itself expands and contracts. Rhetoric is potentially about everything that can be communicated, and so about all thought and language. But the use of speech in deliberation about the concrete and practical particular is always at its core. As ethics after Aristotle became less political, so too did rhetoric. In Plato's dialogue, Protagoras defines his subject politically as the abilities without which men could not be citizens. Others softened the definition to the ability to speak on those matters on which people would be ashamed not to have an opinion, that is, the field of common sense and common understanding. Austin's (1962) inquiry captures part of the idea of persuasive communication apart from a political context, and shows the alliance between the linguistic and the rhetorical turns of philosophy (see Austin, J.L.). Some argue that rhetoric is as broad as human speech in general, with extensions to general rhetorics like the 'rhetoric of inquiry' or 'rhetoric of the human sciences' or, as with Burke, to all strategies for encompassing situations. Others would restrict it to public or political affairs. The broadening of rhetoric is sometimes a reflection of the lack of political, or even practical, functioning for rhetoric, and sometimes a corrective to the impractical specialization and professionalization of rhetoric itself. The logic, ethics and poetics against which rhetoric defines itself are usually much broader than the three sources of proof in Aristotle's account.

3 Rhetorical methods and philosophy

As rhetoric developed, it elaborated specific techniques for persuasion, and even if rhetorical activity had no philosophic dimensions, the history of rhetoric would still offer a usable history of persuasion. The first rhetorical method with philosophic import is that of topical invention, which brings into focus the relation between rhetoric and logic. *Topos* is the Greek word for place, translated into Latin as *locus*. *Koinoi topoi* became *loci communi* and then, in English, 'commonplaces,' places to find arguments, pigeon-holes for classifying appeals, or major premises from which to derive particular conclusions. Topics are the means for finding something persuasive to say in a practical situation. Aristotle defines rhetoric as an art of finding in any case the available means of persuasion. Subsequent rhetoricians make invention (*heuresis*, *inventio*) the first of five parts of rhetoric, alongside judgment (sometimes called disposition or arrangement), style, memory and delivery. Any of these can be a merely verbal technique or an art with philosophical significance. The topics can range from the logical ('similar effects have similar causes') to more substantive considerations ('follow the money'; '*cherchez la femme*'; 'we all know that Athenians are acquisitive'). Often there is a connection between methods for finding arguments and systems of artificial memory for recalling them. When the rhetorical invention of arguments is replaced by a scientific discovery of things, only style remains in rhetoric's domain. Ramus' (1574) division of labour between a topical dialectic or logic and a rhetoric confined to style and arrangement in the early modern period is perhaps the most historically influential of such moves.

Scientific method might supplant rhetorical invention, but the methods of scientific discovery which replace rhetorical invention were themselves derived from topical invention. Much of the meaning of necessity in seventeenth-century science, for example, derives from pleas of necessity as an excuse or justification in legal proceedings. Stephen Toulmin's (1964) 'inference warrants', which supply the connection between grounds and claims, is one recent reappearance of the topics; Chaim Perelman's (1969) *loci* for establishing connections is another.

Hume finds the meaning of 'personal merit' through epideictic rhetoric by 'displaying the praises of any humane, beneficent man'. He refers to the considerations used as the 'topics of praise'. The inter-relations among the three kinds of rhetoric, and the kinds of argument appropriate to each, generate significant philosophical problems. Why, as Hume asks, does utility please? What is the relation between the impartial spectator whose judgment is the focus of epideictic rhetoric, the judge whose verdicts are the end of forensic rhetoric, and the ideal deliberative agent? What is the relation between the right and the good, or between what is best and what should be done? What is the connection between action-guiding and agent-evaluating reasons?

The other two philosophically interesting rhetorical methods besides topical invention can trace their ancestry back to Plato and Aristotle, but were really developed in later rhetorics which emphasized judicial oratory and the performance values associated primarily with demonstrative rhetoric. Issues - *staseis* in Greek and *constitutiones* in Latin - were rhetoric's central technique for most of its history. The classification of issues evolved out of

practices of judicial rhetoric, which is always the most systematic of the three kinds of rhetoric, and they draw attention to the relation between rhetoric and ethics. There are, usually, four *staseis*: (1) the question of fact or conjectural issue; (2) the definitive stasis; (3) the qualitative issue concerning mitigating or aggravating circumstances; and (4) the translative issue of whether a given court is the appropriate forum for judgment. Kant, not long after Hume, explains the 'principles of any transcendental deduction' by referring to stasis theory: 'Jurists, when speaking of rights and claims, distinguish in a legal action the question of right (*quid juris*) from the question of fact (*quid facti*)' (1787: B116-7). His question of right is the translative issue, by what right knowledge can be judged to have a 'legal title', so the foundations of knowledge cannot be secured by pointing to facts about the success of science. Austin's 'plea for excuses' and contemporary arguments about responsibility invite reconsideration of the rich problems that revolve around the qualitative issue.

If the topics emphasize the relations between rhetoric and logic, and the theory of issues or *staseis* develops the relation between rhetoric and ethics, the third rhetorical method, that of figures or tropes, concerns the relation of rhetoric to poetics. Augustine, in the *de Doctrina Christiana*, used rhetoric to teach Christians to read their Bible figuratively and to adjust contradictory passages by considering the circumstances to which speakers and authors adapted their statements and meanings. For Vico (1744), a near contemporary of Hume and Kant, the 'tropes are corollaries of poetic logic'. Borrowing from a formulation that seems to originate with Ramus, Vico names four primary tropes: metaphor, metonymy, synecdoche and irony. These tropes are not merely elegant variations on things that could be expressed more directly, but reveal original truths hidden by more sophisticated and professionalized philosophy. In the hands of our own contemporaries such as Kenneth Burke (1950) and Hayden White (1973), the figures move from methods of description or redescription into methods of seeing and encompassing situations, as rhetoric is expanded from a verbal to a universal art. Perelman, similarly, constructs a relation between argumentative forms and figures of speech and thought. Vico has become a hero to those who think that progress will come in philosophy from being anti-Cartesian, and championing conversation and communication over more limited, anti-rhetorical, forms of rationality. These examples show how even the most language-centred or poetic dimension of rhetoric has an ethical agenda. The rhetorical emphasis on saying what is appropriate provides the connection between ethical and poetic demands for timeliness and decorum. The current revival and popularity of rhetoric in philosophy often takes the form of a programme to replace science by conversation as the model for community and rationality and the hope for democracy.

Richard of Middleton (*c.*1249-1302)

Richard was a Franciscan philosopher and theologian. In general he followed the tradition flowing from Bonaventure, although on some questions he sided with Thomas Aquinas. However, there is also a strong anti-Thomist reaction in his work. Many of the questions raised in the condemnations of 1277 at Paris and Oxford are central in Richard's works. His answers often echo Bonaventure, William of Ware and Matthew of Aquasparta; yet his argumentation carries his personal stamp and shows him deeply engaged with the definitions and arguments of the authors of his own era.

Richard studied in Paris during the intellectually exciting years 1276-87, probably under William of Ware and Matthew of Aquasparta. In general, the *Doctor solidus* (Solid Doctor) followed the tradition flowing from Bonaventure, although on some questions he sided with Thomas Aquinas, at least in his sober commentary on Peter Lombard's *Sentences* (probably begun in 1281 and completed in 1284). However, while regent master of the Franciscan house of studies in Paris from 1284-87, his *Quodlibeta (Quodlibetal Questions)* manifest a strong anti-Thomist reaction, as do his earlier *Quaestiones disputatae (Disputed Questions)* (disputed after 1277 but before the *Sentences* commentary). In 1295 he was elected Provincial Minister of France, and he died at Reims in 1302.

When Aquinas, for instance, argued that philosophical reason cannot show the impossibility of an eternal creation, Richard was quick to point out the ambiguity hidden in Aquinas' portrait of creation. When the latter speaks of *creatio ex nihilo* (creation out of nothing), he correctly stresses the absolute dependence of creatures on God for existence. Richard charged, however, that Aquinas' definition had excluded any consideration of the issue of duration. By neglecting a treatment of the temporal or eternal character of creation, Aquinas, according to Richard, had built a prejudice in favour of the possibility of an eternal world into his very definition of the term 'creation' (see Eternity of the world, medieval views of).

Richard likewise rejects Aquinas' theory of individuation by matter. For him, the singular is singular by its proper essence, since this concrete essence is of its very nature indivisible. He thus follows in the footsteps of Bonaventure, for whom the ultimate cause of individuation is the very 'act of existence'. Richard agrees with the opinion that 'by the very fact that a thing actually exists, it is numerically one… Because a being in actual existence is composed of essence and actual existence, its being one adds nothing positive to such an actually existing being but only a negation of division' (*Sententiarum* I, d. 24, a. 1, q. 2).

By holding that in each of the elements there is only one substantial form, Richard disagreed with Bonaventure. However, as he moved on to consider the substantial forms in more complex beings, and especially in man, he reaffirmed the arguments of Bonaventure and John Pecham for the plurality of substantial forms. Richard could not see how, for instance, those who argued for the unicity of substantial form or the dominance of the intellective or rational soul in man could explain why the accidents of the body remain the same in number after the recession of the intellective soul at death. The unicity-of-form theory, defended by Aquinas, Giles of Lessines, Giles of Rome and many others, is also incapable of explaining human generation. Richard taught that if there is to be any meaning to the phrase 'man generates man', then the vegetative and sensitive forms of the human being must exist before, and must continue to exist after, the arrival of the rational soul created directly by God. There must, therefore, be a plurality of substantial forms in composite beings.

In his theory of universals and in his theory of knowledge, Richard comes close to Aquinas: 'Whatever God has created is singular. A universal exists only through an act of the intellect' (*Sententiarum* I, d. 36, a. 1, q. 1). Intellectual knowledge arises from the singulars of experience by means of the abstraction performed by the agent intellect in human beings. Richard rejects the need for special divine illumination, defended by Bonaventure, to account for our intellectual knowledge. Human beings know, and they know by means of their own proper intellectual efforts.

This Aristotelian bent continues in Richard's discussion of man's knowledge of God. There is no innate or immediate knowledge of God. He can be known only in starting with creatures and by our reasoning about their origins or purposes: 'We only come to a knowledge of spiritual beings by means of sensible things… and to a

knowledge of God only through sensible and intelligible effects…' (*Sententiarum* II, d. 25, a. 5, q. 1).

Richard's teaching on the primacy of the will returns him to the Augustinian camp. 'The will', he declares, 'is unqualifiedly more noble than the intellect' (*Sententiarum* II, d. 24, a. 1, q. 5). Richard argues that it is more noble to love God than to understand him, since such understanding, if not linked with love, keeps us aloof from God' (*Quaestiones disputatae* q. 10, a. 3). The nobility of our will, furthermore, is found in its freedom. Unlike the intellect, which can be forced by evidence, the will remains free except in the case of its end, the good. This object the will must pursue by the radical tendency built into it by its creator. However, the will is free in regard to all the means leading to that predetermined goal. There is no parallel between the case of the intellect, in connection with which we are forced to accept a logically drawn conclusion once we have accepted the premises, and the will in regard to those things that lead to our end. Even when our intellect shows us the best means to our end, we do not have to adopt them: 'For although the intellect, like a servant with a lamp, points out the way, the will, like the master, makes the decisions and can go in any direction it pleases' (*Sententiarum* II, d. 38, a. 2, q. 4).

Richard, with a questioning spirit, most often follows the tradition of Bonaventure. His commentary on the *Sentences* in particular represents a solid, searching mind in an age of great philosophical challenge and confusion.

Richard of St Victor (d. 1173)

Richard is most famous for his contemplative doctrine, which is based on a biblical anthropology that involves a philosophical psychology and noetic theory. Richard's writings should be understood in the context of Hugh of St Victor's programme for a complete theological pedagogy, organized according to the threefold sense of Scripture (literal, allegorical, tropological). Richard's specifically exegetical works include an encyclopedic introduction to the methods of interpreting Scripture, the Liber exceptionum, and important commentaries on the Apocalypse and Ezekiel. Like Hugh, he stresses that the literal sense of Scripture is the foundation of its spiritual senses.

Richard of St Victor was a native of Scotland or Ireland. He became an Augustinian Canon Regular at the Abbey of St Victor in Paris, where he was a student of Hugh of St Victor. He later served as sub-prior and prior of the monastery and was the master of its famous school. He died in 1173.

Richard's most important speculative work is *De trinitate (On the Trinity)*. In the manner of Anselm of Canterbury, through a 'faith seeking understanding' he discovers 'necessary reasons' for God's existence, the divine attributes and the Trinity. Richard does not 'demonstrate' the Trinity, but through a conceptual logic of perfection considers the divine being as it is revealed in Scriptures. The reasons for the Trinity are intrinsic to God's 'necessary' being and attributes. God is love or Goodness itself, which by nature is wholly self-giving. God is also Glory itself and Felicity itself, which likewise communicate themselves wholly. This threefold communicative fullness requires that there be one who gives himself exhaustively, one who receives and gives back himself exhaustively and one who from both receives exhaustively. A further existential category of 'one who gives nothing and receives nothing' is inconceivable. Therefore the circle of self-giving and receiving is consummated in three 'persons', each of whom possesses divine existence incommunicably and independently. Richard's account of the Trinity had considerable influence on Alexander of Hales, Bonaventure and John Duns Scotus (see Trinity).

According to Richard's contemplative teaching, union with God is possible because the soul's rational 'force' is created in the 'image' of God, and its affective 'force' is made in the 'likeness' of God. Originally the human body also reflected the divine nature. By the Fall, human reason was corrupted by ignorance, the affections by concupiscence and the body by infirmity and death. The light of divine wisdom heals the soul's ignorance, divine charity heals its concupiscence and the virtues alleviate the body's infirmity, although they cannot prevent its death. Within this dynamic of sin and grace, Richard develops a philosophical psychology of contemplation and spiritual perfection (see Grace).

In *De duodecim patriarchis (The Twelve Patriarchs)*, or *Benjamin minor*, Richard interprets the affiliations among the wives and sons of Jacob tropologically (that is, morally and mystically), as signifying relations among powers and virtues of the soul. In *De arca mystica (The Mystical Ark)*, or *Benjamin major*, he tropologically interprets the features of the Ark revealed to Moses, as signifying cognitive powers of the soul. The soul's imaginative, reasonable and 'intelligent' powers apprehend, respectively, sensible, intelligible and transcendent 'intellectible' realities. These modes of apprehension diversify into six genera of contemplation. The first four are 'in the imagination according to imagination', or wonder at the order and form of sensible realities; 'in the imagination but according to reason', whereby the spirit discerns the principles underlying sensible realities; 'in reason according to imagination', whereby one discovers the similitudes of invisible realities in visible symbols; and 'in reason according to reason', whereby one contemplates purely spiritual created beings (for example, the human soul and its operations, angelic beings). These kinds of contemplation are attainable by human 'industry' aided by God, but the last two depend solely on the light of grace shining in the 'fine point of the intelligence'. The fifth kind, which contemplates the divine unity and attributes, is 'above reason but not without it'. The sixth 'is above and beyond reason' and seemingly against it, inasmuch as it regards mysteries (the Trinity, the Eucharist) that elude the priniciples of human thought.

Richard's philosophical psychology derives ultimately from Neoplatonic sources. The human soul is able to know itself immediately. Its rational and affective 'forces' are reciprocal and not really distinct, but are simply different modes of its operation. Hence love and desire motivate the search for wisdom, and understanding elicits love and desire. The soul's highest cognitive power, the 'intelligence', transcends discursive reasoning and penetrates

spiritual realities intuitively (see Platonism, medieval).

Richard of St Victor's contemplative writings profoundly influenced Bonaventure's *Journey of the Mind into God* and Dante's *Comedy* (see Alighieri, Dante). Bonaventure designates Richard (with Pseudo-Dionysius) as the exemplar of 'anagogic' or mystical theology. Accordingly, in the later Middle Ages Richard was a standard authority among mystical writers.

Richard Rufus of Cornwall (d. after 1259)

A thirteenth-century philosopher and theologian, Rufus was among the first Western medieval authors to study Aristotelian metaphysics, physics and epistemology; his lectures on Aristotle's Physics are the earliest known surviving Western medieval commentary. In 1238, after writing treatises against Averroes and lecturing on Aristotle - at greatest length on the Metaphysics - he joined the Franciscan Order, left Paris and became a theologian.

Rufus' lectures on Peter Lombard's Sentences were the first presented by an Oxford bachelor of theology. Greatly influenced by Robert Grosseteste, Rufus' Oxford lectures were devoted in part to a refutation of Richard Fishacre, the Dominican master who first lectured on the Sentences at Oxford. Though much more sophisticated philosophically than Fishacre, Rufus defended the more exclusively biblical theology recommended by Grosseteste against Fishacre's more modern scholasticism.

Rufus' Oxford lectures were employed as a source by Bonaventure, whose lectures on the Sentences were vastly influential. Returning to Paris shortly after Bonaventure lectured there, Rufus took Bonaventure's lectures as a model for his own Parisian Sentences commentary. Rufus' Paris lectures made him famous. According to his enemy Roger Bacon, when he returned to Oxford after 1256 as the Franciscan regent master, his influence increased steadily. It was at its height forty years later in the 1290s, when John Duns Scotus was a bachelor of theology. Early versions of many important positions developed by Duns Scotus can be found in Rufus' works.

1 Natural philosophy

As far as we know, the earliest work we have by Rufus is a set of lectures on Aristotle's *Physics*, presented at Paris shortly before the ban against teaching the *libri naturales* was formally lifted. A series of brief questions on issues raised by the Aristotelian text, they have never been published. The published works they most closely resemble are Roger Bacon's post-1237 question-commentaries.

Rufus' *Physics* commentary is important in part because of his unorthodox approach, often departing from Averroes' interpretation of Aristotle. Those departures Bacon consciously rejects. A case in point is the explanation of projectile motion. Rufus is the first Western scholastic to declare Aristotle's account of projectile motion inadequate. No explanation involving only the medium could be adequate because there can be projectile motion in opposite directions in a uniform medium, and because different projectiles move through the same medium at different speeds. To explain projectile motion, Rufus posits an imprint of violent motion in the projectile, but he does not completely reject Aristotle's account. Arguing that the projector affects the medium as well as the projectile, he explains projectile motion in terms of the effect of violent motion both on the projectile and on the medium. Postulating an imprint of violent motion on the projectile, he also accepts *antiperistasis* as an account of the effect of violent motion on the medium. By contrast, Bacon rejects imprint theory, arguing that there is constant substantial contact between mover and moved object; 'everything that moves is moved by another'. Other contemporaries rejected imprint theory on the grounds that Rufus could not precisely explain what was imprinted. However, Rufus' views had continued currency and were cited, accepted and given a fuller exposition in the fourteenth century by Franciscus de Marchia (see Natural philosophy, medieval).

Among the first medieval Western philosophers to encounter Aristotle's arguments for the eternity of the world, Rufus also presented some of the most cogent counter-arguments. One argument is based on a contradiction between the definitions of 'past' and 'infinity'. It is impossible to traverse an infinity, but it pertains to the nature of the past to have been traversed; therefore, past time cannot be infinite. Rufus presents the argument with characteristic brevity: 'Having been traversed' is incompatible with the definition of 'infinity', but 'having been traversed' belongs to the definition of the past. Therefore, being past is incompatible with the definition of infinity.

This argument, first presented in late antiquity by John Philoponus, is now associated with Immanuel Kant; in medieval philosophy, it is ordinarily ascribed to Bonaventure, who advanced it in 1250 or 1251. It occurs in different versions, some more persuasive than others. Grosseteste, for example, mistakenly seeks to apply it to the future as well as the past, claiming that the argument can be used to show that time could not be infinite *a parte post*. Rufus sees even more clearly than Philoponus that the direction of time is an important part of this argument.

He notices that the argument needs to be based on the fact that the *whole* of past time has been traversed, rather than on the claim that the whole of the past and the future will have been traversed. In his later work he seeks to force his opponents to see that they are committed to the claim that some past days are not now and never were present. By contrast, Philoponus sees this as an argument about the impossibility of completely counting an infinite series, with no particular focus on the direction of time.

Rufus' version of another of Philoponus' arguments is based on our concept of priority. If the number of days before today is infinite, and the number of days before tomorrow is infinite, then the number of days before today is not less than the number of days before tomorrow. Consequently, today does not arrive sooner than tomorrow, which is absurd. Rufus assumes here that unequal infinities are impossible. Following Georg Cantor, modern mathematicians reject this assumption. However, Rufus needs only the uncontroversial claim that mappable infinities are equal: if we postulate beginningless time, the number of days before today and the number of days before tomorrow are mappable infinite series. Rufus might still argue that if the world has no beginning, then we must give up the belief that less time elapses before earlier events than before later events.

Philoponus' original version of this argument is not based on the claim that more time transpires before later events than before earlier events. The absurdities he asks us to reject are mathematical: that it is possible to add to an infinity, or that one infinity can be multiplied by another, so that one infinity would be greater than another by a determinate proportion. By contrast, the absurd conclusion Rufus asks us to reject is that 'today does not come sooner than tomorrow'; he emphasizes the unique properties of time (see Eternity of the world, medieval views of).

2 Epistemology

The fullest statement of Rufus' epistemological views now known is a treatise entitled *Speculum animae (A Mirror of the Soul)*, probably written to explain problems in Aristotelian philosophy to his Franciscan confrères. In this ambitious treatise, Rufus attempts to explain what Aristotle means when he says that 'in some manner the soul is every thing'. Rufus asks in what sense the soul becomes an object when it understands or senses that object. He rejects the view his predecessors based on patristic authorities: the soul is everything because it shares being with rocks, life with animals and understanding with angels. He also rejects a literal interpretation of the dictum. This leaves Rufus in a difficult position, since he holds that species in the soul are really identical with the common natures exemplified in external objects. If the material in the sensory soul combines with the sensible species, why does not the soul become green when it perceives something green? There are two elements in Rufus' reply: one is to postulate a different kind of being for sensible and intelligible species. Sensible species are not natural beings, in the sense that they are not included in the Aristotelian categories; they are neither substances nor accidents. Because they are different kinds of entities, when they combine with the soul, what is produced is not the object itself but cognition. The second element of Rufus' reply is to argue that what is formally distinct may be really identical. Species have the same real nature, but are not formally identical with, or predicable of, the objects they represent in the soul. This safeguards the claim that what we perceive is really the same as external objects; in some sense the soul really is all things.

3 Metaphysics

Postulating a kind of identity which permits real but not formal predication is a conceptual tool which Rufus employs when discussing a variety of philosophical topics, for example, the problem of individuation. Like Duns Scotus in his *Metaphysics* commentary, Rufus postulates individual forms to explain individuation. Individual forms are really, but not formally, the same as specific forms. Specific forms are principles of shared identity; they pertain to common natures capable of instantiation (*multiplicabilis*). By contrast, individual forms pertain to the same individual natures as are actually instantiated (*actu multiplicata*).

Rufus' arguments against alternative theories were initially more influential than his own views. He holds that the cause of individuation cannot be an accident or an aggregation of accidents, since individual primary substances are ontologically prior to accidents. Though he allows a role for matter as an occasional cause of individuation, Rufus argues that even determinate matter could not by itself be the principle of individuation. Being an individual means being distinct and united, both of which are functions of form, the active principle of substance, not matter, the passive principle.

Holding that individual forms added to an aggregate of matter and specific form must be the principle of individuation, Rufus denies that the ultimate constituents of individuals are knowable. He is not sure whether what is added to the common nature can be located within an Aristotelian category. He suggests that, strictly speaking, the cause of individuation may be neither a substance nor an accident. Identifying individual forms as perfections of the specific form, he suggests that they may be substantial without being substances. Specific and individual forms provide different degrees of unity: specific unity is less than individual unity and greater than generic unity.

Like Rufus' views on individuation, his argument for the existence of God was accepted and modified by John Duns Scotus. Rufus rejected Anselm's famous ontological argument as sophistical (though subtle) (see Anselm of Canterbury). In its place he advanced a modal argument based on the concept of God as an independent being (*a se et non ab alio*). The existence of independent beings is either necessary or impossible. Therefore, if an independent being can exist, it does exist. Rufus employs logically sophisticated arguments to show that an independent being can exist.

4 Logic

Rufus' works are all characterized by rigour and logical subtlety, but whether he wrote any independent treatise in logic is not yet clear. One such treatise, called *Abstractiones*, has been plausibly attributed to him. It is a guide to the proper exposition of ambiguous propositions, often propositions including syncategorematic words such as 'only' and 'every' or modal operators such as 'possible' and 'necessary'. If this attribution is correct, Rufus was known to fourteenth century Franciscans such as William of Ockham as the 'Magister Abstractionum'.

5 Influence

Rufus' importance has long gone unrecognized, in part because he preferred not to take credit for his own work and in part because, unlike his contemporaries, he provided lengthy quotations of the positions he treated seriously. Since his own views were often stated briefly, historians who overlooked his critical bent saw him as a derivative figure. Now that Bonaventure's borrowing from Rufus has been discovered, and we are beginning to appreciate the significance of citations by Robert Grosseteste (Magister Richardus), John Duns Scotus (*Doctor antiquus*) and Franciscus de Marchia (Richardus), the question of Rufus' influence will have to be reconsidered. The first prerequisite is a critical edition of his works.

REGA WOOD

List of works

As noted, there is no critical edition of Richard Rufus' works, most of which survive only in a single manuscript. Extant works include commentaries on the *Physics* and *Metaphysics* of Aristotle; two treatises against Averroes (*De ideis (On Ideas)* and *De causa individuationis (On the Basis of Individuation)*; disputed questions; two commentaries on Peter Lombard's *Sentences*, lectures given at Oxford and Paris; and an epistemological treatise (*Speculum animae (A Mirror of the Soul)*). Lost or unidentified is a commentary on Aristotle's *Meteorology*, cited by Bartolomeus Anglicus.

Ricoeur, Paul (1913-)

Paul Ricoeur is one of the leading French philosophers of the second half of the twentieth century. Along with the German philosopher Hans-Georg Gadamer, Ricoeur is one of the main contemporary exponents of philosophical hermeneutics: that is, of a philosophical orientation which places particular emphasis on the nature and role of interpretation. While his early work was strongly influenced by Husserl's phenomenology, he became increasingly concerned with problems of interpretation and developed - partly through detailed inquiries into psychoanalysis and structuralism - a distinctive hermeneutical theory. In his later writings Ricoeur explores the nature of metaphor and narrative, which are viewed as ways of creating new meaning in language.

1 Early work

Born in Valence in 1913, Ricoeur began his philosophical career at a time when phenomenology and existentialism were influential in French intellectual circles. As a student in Paris in the late 1930s, and subsequently as a prisoner of war in Germany during the Second World War, Ricoeur read the work of Husserl, Heidegger, Jaspers and Marcel. Following the war, Ricoeur and Mikel Dufrenne published a lengthy study of Jaspers, *Karl Jaspers et la philosophie de l'existence* (1947); in the same year, Ricoeur published his own comparative study of Jaspers and Marcel. Ricoeur also translated Husserl's *Ideen I* into French, thereby establishing himself as a leading authority on phenomenology (see Phenomenological movement).

In 1948 Ricoeur was elected to a chair in the history of philosophy at the University of Strasbourg. During the following decade Ricoeur sought to develop an ambitious project on the 'philosophy of the will': that is, a systematic reflection on the affective and volitional aspects of human existence. In the first volume of this project, *Freedom and Nature* (1950), Ricoeur employed a phenomenological method to explore the interplay between the voluntary and the involuntary features of life, such as the way in which action is mediated by the organs of the body and by a range of factors which lie beyond the individual's control. The second volume of the philosophy of the will was published in 1960 as two separate books: *Fallible Man* and *The Symbolism of Evil*. In these books Ricoeur moved away from a strict phenomenological method and began to develop a more interpretative approach to symbols and myths, as a way of gaining access to problems of human fallibility and fault. Ricoeur sketched the plan for a third volume which would be concerned with the 'poetics of the will', but postponed this project while he turned his attention to other matters.

2 Psychoanalysis and structuralism

In 1957 Ricoeur was elected Professor of Philosophy at the Sorbonne where he remained until 1966, when he was appointed Dean at the University Paris X, Nanterre - a position he currently holds in conjunction with Professorships in the Department of Philosophy and the Divinity School at the University of Chicago. In the late 1950s and early 1960s, the intellectual climate in Paris was changing in significant ways: there was a growing interest in psychoanalysis, and structuralist ideas were beginning to have a significant impact. Ricoeur responded to this change by undertaking a detailed inquiry into the work of Freud and by engaging critically with some of the key texts underpinning the structuralist approach (see Psychoanalysis, methodological issues in; Structuralism).

Freud and Philosophy appeared in 1965 and is one of Ricoeur's best-known works. Ricoeur provides a thorough analysis of the development of Freud's work, with the aim of bringing out its philosophical relevance. Unlike philosophical orientations (like phenomenology) which take the contents of consciousness as a starting point, Freud begins by questioning the primacy of consciousness and looking elsewhere, at the level of the unconscious, for the key processes that shape psychic life. But, as Ricoeur shows, Freud's postulation of unconscious processes is inseparable from the activity of interpretation. Psychoanalysis is, on Ricoeur's account, a form of hermeneutics in which the analyst employs a specialized set of rules, assumptions and models in order to make sense of actions and utterances that are initially difficult to understand. Hence psychoanalysis should be regarded, not as a natural science like physics or chemistry, but rather as an interpretative discipline similar in character to history and literary criticism; it is a discipline concerned with deciphering symbols and signs in relation to the expression of desire.

Ricoeur's critical discussions of structuralism appeared in a series of essays which were brought together in a

volume entitled *The Conflict of Interpretations* (1969). There were many thinkers in France and elsewhere who argued that the principles of structural linguistics - especially as elaborated by the Swiss linguist Ferdinand de Saussure - provided a generalizable model that could be used for the analysis of social and cultural phenomena (see Structuralism in linguistics). Ricoeur had serious reservations about this line of argument. He wanted to show that, while structuralist methods of analysis could be useful for certain purposes, they were based on a number of assumptions which limited their validity. Hence structuralist methods could not provide a comprehensive and self-sufficient approach; they had to be integrated into a broader hermeneutical theory (see Hermeneutics).

Ricoeur developed this argument through a rigorous analysis of the work of some of the authors who were influential in the rise of structuralism. This included the work of structural linguists, such as Saussure, Jakobson and Hjelmslev, as well as the work of the anthropologist Claude Lévi-strauss - one of the few thinkers who explicitly and consistently described himself as a structuralist. Through a brilliant analysis of Lévi-Strauss's writings on myth, Ricoeur showed that Lévi-Strauss was constantly overstepping the limits of validity of the structuralist approach, ending up in what Ricoeur described as 'a Kantianism without a transcendental subject'. Ricoeur also argued that the structuralist analysis of myth was at best a partial account, since it neglected, among other things, the ways in which myths were embedded in historical traditions that were handed down from one generation to the next.

3 Text and interpretation

Ricoeur's critique of Lévi-Strauss and others remains one of the best accounts available of the strengths and weaknesses of the structuralist approach. It also formed the backcloth against which Ricoeur developed his own hermeneutical theory. In a short text called *Interpretation Theory* (1976) and in a series of essays reprinted in *Hermeneutics and the Human Sciences* (1981), Ricoeur worked out a systematic theory of interpretation based on a distinctive notion of the text. A text, according to Ricoeur, is an instance of written discourse; it involves four forms of 'distanciation' which differentiate it from the conditions of speech. First, in spoken discourse there is an interplay between the event of saying (the utterance) and the meaning of what is said; but in the case of written discourse, the event of saying is eclipsed by the meaning of what is said: it is the meaning which is inscribed in the text. Second, whereas in spoken discourse there is an overlap between the intention of the speaking subject and the meaning of what is said, in the case of written discourse these two dimensions of meaning drift apart: the meaning of the text does not coincide with what the author meant. Third, whereas spoken discourse is addressed to a specific recipient, written discourse is addressed to an unknown audience and potentially to anyone who can read. Fourth, whereas the shared circumstances of the speech situation provide some degree of referential specificity for spoken discourse, in the case of written discourse these shared circumstances no longer exist.

These various characteristics of the text provide the basis upon which Ricoeur elaborates his theory of interpretation. Like earlier thinkers within the tradition of hermeneutics, Ricoeur treats the text as a privileged object of interpretation. But unlike earlier thinkers, Ricoeur argues that the process of interpretation can be facilitated and enriched by the use of explanatory methods of analysis. Since a text is a structured totality of meaning which has been distanced from its conditions of production, it can be analysed fruitfully and legitimately by means of structuralist methods. But this type of analysis can never be an end in itself. It can only be a step along the path of interpretation - that is, a partial contribution to the broader hermeneutical task of unfolding the 'world' of the text and the significance it has for its readers.

While Ricoeur's theory of interpretation is formulated with regard to texts, he argues that it can be extended to non-textual phenomena like action (see *Hermeneutics and the Human Sciences* (1981) and *From Text to Action* (1986)). Ricoeur's argument is that action involves the four forms of distanciation characteristic of written discourse; and hence, for the purposes of analysis, action can be treated as a text. One advantage of this approach is that it enables Ricoeur to propose a novel solution to the problem of the relation between explanation and understanding in the social sciences. Just as the interpretation of texts can be facilitated by the structuralist analysis of their contents, so too the understanding of action can be enriched by an explanatory account. Hence explanation and understanding are not necessarily opposed to one another, as some philosophers of social science have suggested (see Social science, contemporary philosophy of). Rather, the explanation of action can be treated as an integral part of a process of understanding.

4 Metaphor and narrative

Throughout his writings Ricoeur has been interested in the phenomena of creativity and imagination, and in the 1970s and 1980s he pursued this interest through his extensive studies of metaphor and narrative. *The Rule of Metaphor* was published in 1975, and the three volumes of *Time and Narrative* appeared in 1983, 1984 and 1985. Metaphor and narrative are particularly interesting for Ricoeur because they are sites of creativity in language: they are works of displacement and synthesis in which the productive imagination is expressed.

On Ricoeur's account, the creative character of metaphor stems from the fact that a metaphorical utterance sets up a tension between two terms in a sentence through the violation of a linguistic code. The metaphor emerges through a creative semantic pertinence which reduces the tension established by the incongruous attribution. Metaphor thus operates not simply at the level of words, but rather at the level of the sentence. The emergent meaning can be grasped only through a constructive interpretation, an imaginative restructuring of semantic fields, which makes sense of the sentence as a whole. The creative character of metaphor does not destroy the referential dimension of language but rather endows metaphor with a new kind of referential power: the power to redescribe reality (see Metaphor).

In the case of narrative, the semantic innovation consists in the invention of a plot. By bringing together characters, goals, causes and chance, the plot of a narrative creates something new: a new pattern in the organization of events. To understand this pattern, one must use the imagination to grasp the diverse elements of the plot, integrating them into a complete and intelligible whole. Moreover, just as metaphor has the referential power to redescribe reality, so too narrative has what Ricoeur calls, following Aristotle, a 'mimetic function'. The invention of plots - or, more generally, the telling of stories - is the means by which we refashion the field of human action and refigure the temporality of human existence. In this respect, suggests Ricoeur, the difference between fictional narratives (such as novels) and historical narratives (that is, works of historical scholarship) is not as great as it might at first appear to be. Of course, historians generally assume that their narratives bear some relation to a past that is presumed to be 'real'. But, at a more general level, both historical narratives and works of fiction are concerned with the refiguration of the temporality of human existence.

As his writings on metaphor and narrative illustrate, Ricoeur addresses problems which are of interest not only to philosophers but also to individuals in other disciplines. His work has had a significant impact on debates in literary criticism, theology, sociology, anthropology and history. There is a consistent vision that animates Ricoeur's work, a vision that emphasizes creativity, interpretation and the social-historical embeddedness of human action and existence. But Ricoeur's work is also distinguished by its generous assessment of other thinkers and its openness to other disciplines and traditions of thought.

Right and good

'Right' and 'good' are the two basic terms of moral evaluation. In general, something is 'right' if it is morally obligatory, whereas it is morally 'good' if it is worth having or doing and enhances the life of those who possess it.

Acts are often held to be morally right or wrong in respect of the action performed, but morally good or bad in virtue of their motive: it is right to help a person in distress, but good to do so from a sense of duty or sympathy, since no one can supposedly be obliged to do something (such as acting with a certain motive) which cannot be done at will.

Henry Sidgwick distinguished between two basic conceptions of morality. The 'attractive' conception, favoured by the ancient Greeks, views the good as fundamental, and grounds the claims of morality in the self-perfection to which we naturally aspire. The 'imperative' conception, preferred in the modern era, views the right as fundamental, and holds that we are subject to certain obligations whatever our wants or desires.

1 Meaning of the terms

There are two different ideas of moral value, which the everyday usage of 'right' and 'good' comes close to matching (see Morality and ethics). The idea of right refers to what is obligatory, to a prescription to which we ought to conform (see Duty). The idea of good, by contrast, refers to what is desirable; it applies to whatever is worth having or doing and enhances the life of which it is a part. Clearly, the obligatory and the desirable are not the same. Pleasure at the sight of another's success may well be morally admirable without being obligatory; so, too, some duties are ours, it seems, whatever their performance may mean for the quality of our lives. Each of these fundamental notions plays an essential role in our moral thinking, and morality as a whole turns on the relations assumed to exist between them.

W.D. Ross' classic study, *The Right and the Good* (1930), explains the difference between moral right and good along these lines. But Ross wrongly supposed that it is as easy to determine which things are morally right and which things morally good as it is to distinguish conceptually between the obligatory and the desirable. What counts as obligatory and what as desirable are often controversial. Like Kant before him, Ross held that acts are morally right or wrong in respect of the action performed, but morally good or bad in virtue of their motive (see Kantian ethics §2). In Ross' view, it cannot be obligatory or morally right that I act with a certain motive - that I keep my promise, not out of fear for my reputation, but because I believe it the proper thing to do. For 'I ought' implies 'I can', whereas I cannot by choice produce a certain motive.

Though near-canonical, this analysis of moral action rests on shaky ground. True, it is often said that we cannot have an obligation to do what it is not in our power to do, and the feelings or convictions that may move us to act cannot be brought about at will. Yet there is also the common thought that it is right, not just to acknowledge our benefactors, but to do so with a sense of gratitude. In addition, the principle that 'ought' implies 'can' is not really so evident as sometimes believed. It does not even seem to fit every case of obligatory action. As Aristotle observed, people may pursue a life of injustice for so long that they become unable to do what justice still requires. No doubt, these conflicting commitments can be qualified so as to hang together with some coherence. But we should not suppose that reasonable people will agree upon the way to do it.

2 Ancient and modern ethics

Another question has to do with how the right and the good are themselves to be related at the foundations of ethics. Henry Sidgwick gave this problem a probing analysis in *The Methods of Ethics* (1874). The nature of moral value, he suggested, assumes two different forms, depending on whether the right or the good is considered the more basic notion. In the one case, he wrote, morality has an *imperative* form, in the other an *attractive* one. In addition, these two views were in his eyes historically distinct: the priority of the good was central to Greek ethics, whereas modern ethics has largely embraced the priority of the right. Sidgwick's remarks contain important insights, both philosophical and historical.

Sidgwick distinguished the imperative and attractive conceptions of morality in the following way. To suppose that the right is fundamental is to hold that there are principles of conduct which are binding or obligatory,

whatever our wants or desires may be. By contrast, to assume that the good is basic is to believe that proper conduct is what we would display if we were sufficiently informed about what at bottom we really desire. Of course, each conception makes use of the other moral notion as well, though in a subordinate position. If the right is fundamental, then, to be good, what the agent wants must conform to the demands of obligation; the good is the object of right desire. If the good is fundamental, then the right is what one ought to do in order to attain what one would want if adequately informed. Thus, the imperative view of morality makes the right prior to the good, whereas the attractive view makes the good prior to the right.

These two theoretical conceptions become clearer if we look at the evidence which led Sidgwick to correlate them with the different outlooks of ancient and modern ethics. The ethical thought of Plato and Aristotle drew upon an attractive notion of good, for they regarded the exercise of moral virtue as an intrinsic part of the 'happy' or fulfilled life that by nature each human being desires as the ultimate end (see Eudaimonia). For them, morality is the agent's interest well-understood. This does not mean that their ethical outlook was a species of egoism, at least as that position is usually defined (see Egoism and altruism). For they believed that the agent's self-fulfilment consists in the exercise of virtue (instead of being a condition instrumentally advanced by it), so that we achieve the fulfilled life we want only by being generous, courageous, and so on, for their own sakes. But the crucial point is that, though both philosophers indeed referred to what we 'ought' to do, they appealed nowhere to the idea that there are obligations binding on all agents unconditionally (or 'categorically', as Kant would say). Theirs was an ethics in which the good is prior to the right.

The priority of the right over the good is an expression that comes from Kant. But Sidgwick rightly maintained that the imperative conception is in reality a broad one, encompassing much of modern ethics. It seems to have first appeared among late medieval Franciscans such as Scotus and Ockham. Rejecting the idea of a perspicuous natural order in the name of God's inscrutable omnipotence, they shifted the source of moral principles from what human beings naturally desire to what God commands (see Duns Scotus, J. §14; William of Ockham §10). In fact, Scotus anticipated developments we associate with Kant, arguing that the Christian rule of loving others for their own sake and thus the idea of justice in its fullest sense cannot rest on the natural desire for self-perfection that underlies Aristotelian and Thomistic ethics, but only on a freedom of will that can suspend that desire (see Perfectionism; Autonomy, ethical §2). Christian theology, with its image of God as moral legislator and its ideal of disinterested love, played a decisive role in the rise of an ethics of the right (see Love §2).

Freed from a theological idiom, the imperative conception of morality has dominated modern moral philosophy. The utilitarian tradition, at least since Sidgwick himself, is no exception (see Utilitarianism). In *Ethics* (1963), William Frankena wrongly, but influentially, described the difference between deontological and utilitarian theories as lying in whether the right or the good is made the fundamental moral concept (see Deontological ethics). In reality, both sorts of theory turn on the priority of the right over the good. The essential principle of any 'consequentialist' theory (utilitarianism being the version that conceives of the good as subjective happiness) is that right action consists in bringing about the most good overall, for all those affected by the action, each 'counting for one and only one' (see Consequentialism). This principle does not subordinate the idea of right action to an independent notion of the good. For it defines the good to be maximized by reference to a categorical principle of right: the maximizand is determined by considering everyone's good impartially, as it is claimed we ought to do, so that the pursuit of the greatest good overall is a duty binding on us unconditionally, whatever the direction in which our own interests would lead us (see Impartiality).

Deontological theories generally hold that we are bound by certain obligations even if an alternative course of action is known to bring about more good overall. But it is not this principle that expresses the priority of the right characteristic of modern ethics. It is rather the view such theories share with consequentialism, namely, the view that moral duty is independent of the agent's own good. This common assumption is foreign to the spirit of ancient ethics, which is why the unending debate between deontological and consequentialist outlooks, so central to modern ethics, never engaged the Greek moralists and their successors.

3 Contemporary problems

Two important qualifications must be made to Sidgwick's account of the difference between ancient and modern ethics. First, even if we agree that we are subject to categorical duties and thus continue to understand ourselves as 'modern', we need not suppose that morality as a whole must fit the imperative conception. A more plausible view

would have a place, not just for a core morality unconditionally binding on all, but also for duties arising from friendship, the ties of place and culture, and membership of particular associations (see Friendship; Family, ethics and the; Solidarity). Such duties are ours only so long as we remain interested in maintaining these social relations. It would be a hollow idea of friendship that implied that we owe our friends the special concern they deserve whatever we may feel about them.

Second, we should note that some important modern philosophers have denied that ‘’right’ or ‘ought’ should play the fundamental role in moral theory. In *An Enquiry Concerning the Principles of Morals* (1751), Hume suggests that the idea of morality as a system of laws is an invention of Christian theology, which, focusing moral approval on what can be performed at will, misses the central importance of the virtues. Schopenhauer (1840) took Kant to task for assuming that ethics must have an imperative form (see Schopenauer, A. §6). That assumption makes sense, he insisted, only within a theological framework, so that the practical postulate of belief in God which Kant drew from his ethics was really its guiding premise all along. And in the twentieth century, G.E.M. Anscombe argued that the modern emphatic sense of ‘ought’ has its home only within the conception of a divine legislator (see Anscombe, G.E.M. §2). While we may feel unconditionally bound by certain obligations, without thinking of any theological framework, these convictions are in her view only ‘survivals’. Having lost all intelligible meaning, they urge themselves upon us with the authority of conscience only because we have been shaped by a tradition in which, however, we no longer believe.

These dissenting voices do not refute Sidgwick’s thesis about the difference between ancient and modern ethics. For all three philosophers understood themselves as protesting against what had become the dominant conception of ethics in modern times. Indeed, Hume and Anscombe urged a return to ancient models. Anscombe’s essay, ‘Modern Moral Philosophy’ (1958), is a charter document of recent neo-Aristotelianism or ’virtue ethics’, which seeks to conceive of the virtues as fundamentally forms of human flourishing (see Virtue ethics). Whether the good should thus be regarded as prior to the right, or whether the modern priority of the right should be maintained, is a cardinal debate of contemporary ethics.

Rights

There is widespread consensus that rights are ways of acting or of being treated that are beneficial to the rightholder. Controversy begins, however, when one attempts to specify the notion of rights further.

(1) It is sometimes said, perhaps too casually, that all rights carry with them correlated obligations - things that other persons are supposed to do or refrain from doing when some given person is said to have a right to something. The question is: how is it best to state this relationship between rights and correlated obligations?

(2) Most people think that rights are, in some sense, justified. But there is considerable controversy as to what, precisely, is the proper focus of justification. Some say that rights are practices (certain ways of acting or of being treated) that are established, typically socially established. Thus, the issue for them is whether the fact of social recognition and enforcement is justified (or could be). Others say that rights themselves are claims; hence a right is a justified claim or principle of some sort (whether the practice identified in that claim exists or not). This dispute, between rights as justified practices and rights as justified claims, needs to be explored and, if possible, resolved.

Other topics need addressing beyond the question of the initial characterization of rights. One of them is the question of the function of rights: what good are they anyway? what can one do with rights? Another is the question of how best to justify particular kinds of rights, such as human rights and basic constitutional rights. Is there a substantive theory of critical morality that can do the job? Many people are concerned, especially, with whether utilitarianism (one of the dominant ethical theories in the West today) is up to this task. Finally, mention should be made of one other issue much talked about of late: what kinds of beings can have rights, and under what conditions of possession and dispossession?

1 Initial characterization and some points of consensus

Rights are an important issue in contemporary social and political philosophy. For it is widely held that rights, by providing a significant protection of important interests of individuals against the state and against other persons (even a majority), give a person something to stand on. One may not want to go so far as to say that rights are ‘trumps’ (as some have), but it is none the less clear that rights are valuable things. So it seems natural to ask: ’what, then, is a right?’

Rights are socially established ways of acting or ways of being treated (or, alternatively, such ways as ought to be so established). More specifically, a right so understood is a right *to* something that is (1) fairly determinate and that (2) can be similarly distributed on an individual basis to each and all of those who are said to be rightholders. A right is always regarded as (3) a beneficial way of acting or of being treated both for the rightholder and, more generally, for society. Thus, (4) it is or should be something socially accepted - recognized and protected in given societies. Such acceptance would be (5) deemed reasonable, even by outsiders, in that it made explanatory sense. For the way of acting or of being treated in question could be exhibited, plausibly, as a means to or as a part of accomplishing some interest or perceived benefit or other good (or desirable) thing. Accordingly, (6) directives could be issued to others, to those who are not rightholders. And (7) further initiatives could be taken as a feature of any such successful claim to rights status.

This initial characterization constitutes common ground in the arguments people make about rights. Indeed, several of its features are not particularly controversial at all. Thus, there would today be widespread consensus on the idea that rights are ways of acting or ways of being treated that are (1) appropriately determinate, (2) equitably distributable on an individual basis and (3) beneficial. Even the central characterization, concerning social acceptability in (4), is not unduly contestable as stated; but dispute would break out as soon as we tried to determine what to emphasize - whether rights are *socially established* or merely *ought* to be. Finally, the idea (6) that rights always involve some sort of normative direction of the behaviour of others might also appear to be universally agreed upon; but there are problems with alleging consensus on this particular point.

2 Normative direction

The view in question in (6) is often put by saying that rights correlate with duties - meaning thereby that a right

always implies or has attached some distinctive and closely related duty of others. But serious difficulties arise for the thesis in this precise form.

The most interesting arguments against such correlations derive from Wesley Hohfeld's highly influential classification of rights (Hohfeld 1964) (see Hohfeld, W.N.). On his view a legal right could be constituted by any one of four elements: a claim; a liberty; a power; or an immunity. And each type of right has a unique second-party correlative. Thus, for a legal *claim right* to some thing the correlative element is a legal duty of some second party. Analogously, a person's *immunity right* from some thing is necessarily correlated with a lack of power - with a legal disability - on the part of others to do that thing (for example, the constitutional inability of the US Congress to 'abridge' free political speech). Hohfeld's point is simply that a legal duty and a no-power (a legal *in*ability) are significantly different. Accordingly, the existence of immunity rights tells against the view that the correlative of every right is always going to be a closely related second-party duty (see Duty).

Thus, the thesis that rights logically correlate with specific duties is not sound. A weaker but more defensible view is that any genuine right must involve some normative direction of the behaviour of persons other than the holder. Even this weaker thesis, however, seems to run up against the authority of Hobbes (in his account of rights in the state of nature) and of Hohfeld. We can see this most clearly by looking at the Hohfeldian liberty right.

Here the legal *liberty right* to do some thing - which consists in the absence of any duty on the agent's part to refrain from doing that thing - is matched with other people's lack of a claim that such a thing not be done by the agent. The point is, this is the *only* directive incumbent on the conduct of second parties in the case of a liberty. They can make no claim on the duties of a liberty-rightholder (to refrain); beyond that their own action is relatively unencumbered.

A liberty right, so conceived, is indeed an odd one. For it fails to capture the common-sense notion that when one has a liberty right to do a thing someone else is directed not to interfere with that doing. The problem is that literally *no* normative direction at all is involved for second parties (in Hobbes' case) and no *significant* normative direction against interference is involved (in Hohfeld's).

If the common-sense notion of a liberty right is correct, there ought always to be some sort of strong mandate for non-interference, either explicitly stated in our formulation of a given liberty or present at least in the context in which that liberty normally occurs. Thus, to take the latter case, certain standing duties of second parties (such as the duty not to assault or batter others or to trespass on their property), even though these are relatively independent of a given liberty (for example, the liberty to paint one's barn a shocking purple), would none the less afford the exercise of that liberty a considerable degree of protection. Without some such fairly robust mandates against interference (either closely connected to the liberty in question or permanently and independently in place on the 'perimeter' of its usual exercise), we would probably be inclined to call that liberty, not a right, but a *mere* liberty or a privilege.

The upshot, then, is that we should state our main contention so as to emphasize *significant* normative direction (on the conduct of second parties). This is the focal point of what appears to be an emerging consensus on the matter at issue.

3 Accreditation

No real consensus has emerged, however, on the point we now turn to: whether rights, in order to be rights, require social recognition (and beyond that, social maintenance). In considering this issue one school of thought - embracing both classical natural rights theorists and contemporary advocates of human rights - has tended to emphasize that individuals can have rights independently of organized society, of social institutions, and hence of social recognition and maintenance in any form. The rather common characterization that rights are essentially claims can be taken as a way of emphasizing that rights hold irrespective of whether they have been acknowledged, either in the society or, more specifically, by that person against whom the claim is made.

Against the view that rights are essentially claims are ranged a number of philosophers. Bentham (§5) comes most readily to mind, and his polemic on this very point against natural rights as 'nonsense' still adds relish to philosophical discussions. T.H. Green, in his insistence that rights require social recognition and that without it they are something less than rights, would be another. And, oddly enough, Lenin would be a third.

The problem we are examining arises, in part, because the procedure for deciding whether something is a right is not wholly settled. We find that the vocabulary of rights, in particular, of human rights, may actually be used at any of several steps: that of mere claim, that of entitlement (where only the claim-to element is really settled), that of fully validated claim (where we have the idea both of a justified claim *to* something and of a justified claim *against* someone for it) and, finally, that of satisfied or enforced claim (where the appropriate measures required to support or to fulfil the claim have been given effective embodiment as well). The presence of these possible stages has introduced a degree of ambiguity into assertions that a right exists.

Accordingly, we find a significant variety of contemporary opinion as to the point at which such assertions can most plausibly be thought to take hold. While some have said simply that rights are *claims* (Mayo 1965), others say they are *entitlements* (McCloskey 1965), and yet others (most notably, Feinberg 1973, 1980) say they are *valid claims*. Ranged against them have been those (such as Sumner 1987; Martin 1993) who emphasize that rights, even human rights, are basically established ways of acting or being treated. And, last of all, some (for example, Rawls 1971; Melden 1988) have treated rights as legitimate expectations and, hence, have landed more or less in the middle (see Rawls, J.).

The main backdrop to the view that rights are (valid) claims is, I think, the common opinion (emphasized by Dworkin (1978), Raz (1986), MacCormick (1977) and Held (1984) among others) that to have a right is to have a justification for acting in a certain way, or a justification for being treated in a certain way (see Dworkin, R.). Now, suppose that a candidate for rights status had all the rights-making features (mentioned in §1) but one. Although accredited (in the sense of justified), it was not established; it lacked the *social* recognition which it ought to have.

Why should the lack of such recognition deprive it of rights status? For, clearly, if we modelled the rights-making features on what was justified (what was accredited in *that* sense), the thing was already a right even before it was recognized, even before it became a practice. And when it was recognized it would be recognized as a *right* (as something that was fully justified) and would not simply *become* a right in being recognized.

The opposing view, that rights are socially recognized practices, rests on three main contentions. The first of these is the contention that the notions of authoritative recognition (if not explicit, then at least implicit, as evidenced by conduct) and of governmental promotion and maintenance (usually on a wide variety of occasions) are themselves part of the standard notion of a *legal* right, that is, when we are concerned with rights that are more than merely nominal ones.

Thus, on the social recognition view, the fatal flaw in the theory of rights as valid claims (in any of its formulations) is the suggestion that practices of governmental recognition and enforcement in law can be dispensed with in the case of legal rights. Indeed, this is the very point at which both Dworkin and Raz, who might otherwise be taken to be supporters of some form of the valid claims thesis, desert that thesis for one that emphasizes the necessity of institutionally establishing ways of acting/being treated, if these are to count as *legal* rights (see Dworkin 1978; Raz 1984).

The second point put forward by the social recognition view is that it is desirable to have, if possible, a single, unequivocal sense of ’rights’: one that is capable of capturing both legal rights and human (and other moral) rights under a single generic heading. Now, if the argument just sketched is to be credited, then the view of rights as valid claims does not provide an adequate generalized notion of rights, one that can comfortably include both legal and human rights. For we have already seen that legal rights cannot be satisfactorily accounted for under the heading of valid claims.

This brings us to the third point urged by the social recognition view. Here the argument is that *all* moral rights can, indeed must, be construed as involving established practices of recognition and maintenance. Since human rights (as a special case of moral rights) are thought to be addressed to governments in particular, we must regard practices of governmental recognition and promotion as being the form for such recognition and maintenance to take for these rights. Here we have, in brief compass, then, the social recognition view that opposes the contention that rights are essentially justified or valid claims.

4 Functions of rights

Rights have many functions. Two in particular are emphasized in the contemporary literature: the conferring of liberty or autonomy (on rightholders) and the protection of their interests, especially their basic interests.

Rights in the seventeenth and eighteenth centuries were largely discussed as if they were simply liberties and, hence, ways of acting on the part of the rightholder. Indeed, this tendency is deeply rooted in the tradition of rights discourse. It is hard to say when 'a right' was first spoken of in a way continuous with current usage, but many careful expositors locate that first recognizable use with William of Ockham (§11), when he talked of a right (*ius* or *jus*) as a power or capacity (*potestas*) to act in accordance with 'right reason' or, in the special case of a legal right (*ius fori*), with an agreement. Such a usage was well established by the seventeenth century (with Hobbes and, some would say, with Locke) and has been widespread ever since.

It constitutes, none the less, a drastic oversimplification - even if the rights referred to are, as they often are, the classic rights of the eighteenth-century declarations. For these rights include important rights to ways of being treated and such rights are *not* things the rightholder does or can do. Even so, the oversimplification continues to prevail in philosophical literature (for example, Hart 1973; Rawls 1971, 1993). Thus, Rawls' 'equal basic liberties' (enshrined in his first principle of justice) include both liberties of action and ways of being treated, typically ways of not being injured by the actions of others (see Freedom and Liberty §3).

It is clearly possible to have both important functions (the conferring of liberty on rightholders and the protection of their interests) as functions of rights, often of a single right. Thus it seems arbitrary, where both functions are normally served by almost all rights, to single out just one of these functions (typically the function of conferring autonomy) and to give it *definitional* weight (see Sumner 1987).

In fact, in line with the contemporary understanding of rights (as expressed, for example, in the UN's *Universal Declaration of Human Rights* of 1948), it might be best to stress three main functions of rights. Thus, the central content of some rights will be a way of acting (for example, a liberty of conduct of some sort). But at the core of other rights will be a way of being treated: a non-injury of some sort or, alternatively, the provision of a service.

Corresponding to each main heading or class of rights (as determined by these central cores), there is an appropriate or characteristic normative response enjoined for the conduct of others. But the essential character of this normative direction of the conduct of second parties shifts from main case to main case. Allowing or even encouraging a piece of conduct is what these parties are normatively directed to do in the case of a liberty; prohibiting their doing of an injury to the rightholder or requiring of them a service, again to the rightholder, is the incumbent directive in the other two cases.

5 Critical justification

Rights are eminently plausible candidates for justification, an idea that I tried to capture in §1 with the notion that rights are *accredited* ways of acting or of being treated. This section will consider some of the main full-blown theories offered to justify rights. One proviso is that the most important rights are universal rights - in particular, human rights and constitutional rights, which are fundamental or basic civil rights of all persons (or all citizens) within a given politically organized society. My account is limited to theories that attempt to justify such universal rights.

All civil rights are important rights and all reflect a high level of social commitment. But not all can be justified as representing individuated and practicable and universal moral claims which serve as proper conclusions to sound arguments from objective principles of critical morality (or at least from principles widely regarded as reasonable).

Some can be, however. Indeed, in the social recognition view (described in §3), human rights would be, simply, constitutional rights that embodied precisely such morally valid claims. These claims, then, when on their own, could be described (relatively noncontroversially and giving due weight to both the opposing views canvassed in §3) as human rights *norms*.

We can ask: what might be involved, then, in the justification of human rights - or human rights norms - and of those constitutional rights susceptible of the same sort of justification? One thing seems clear: the norms which constitute or back up human rights are moral norms. Thus human rights can exist only if substantive moral norms in some sense exist (or, at least, can be objectively described and argued for). Now, it is possible for moral, and hence human, rights to exist even if moral norms are conventional or are relative to culture. But if human rights -

or human rights norms - are to serve their role as international standards of political criticism then such a conventional morality would have to include some norms that are accepted worldwide. More important, if such norms are to have weight and bearing for future human beings in societies not yet existing (and this much would seem to be involved if we are to call these norms *universal* in any significant sense), then these norms cannot be merely conventional (see Universalism, ethical).

Thus, in classifying human rights as moral rights one may wish to distinguish between actual and critical moralities. What seems especially crucial to human rights, then, is the belief that there are objectively correct, or objectively reasonable, critical moral principles. Often, human rights - or human rights norms - are traced back to such foundational ideas as human dignity or moral personality or moral agency or moral community (for example, Melden 1988). But the exploration of such possibilities has failed to gain widespread support, perhaps because such notions as moral agency do not themselves seem sufficiently distinct from the very norms or rights they are being called upon to justify. Or perhaps because such notions seem, in the end, to stand in need of a more basic sort of justification themselves. Thus, we might do well to consider other grounding principles, principles that could be regarded as rock bottom and, arguably, as objectively reasonable.

One appropriate way to narrow the field among these is to consider first those substantive theories of critical justification that have grown up in proximity to serious talk about human and constitutional rights. Three important contemporary theories fit this description: utilitarianism (in particular, the theory developed by J.S. Mill (§10) and advocated recently under the name of ’indirect’ utilitarianism), the theory of John Rawls, and rational-choice ethical theory, especially that of David Gauthier (1986) (see Contractarianism §3). I will confine the discussion to one example.

Rawls’ theory (like Dworkin’s) emphasizes the standing priority of basic liberties and other constitutional rights over such things as the common good or perfectionist values (for example, the value of holiness, as religiously conceived, or the values of Nietzschean elitism). In his 1993 book Rawls sketches a complex theory of justification; it has two main parts. He starts with what he calls a ’freestanding’ justification of the political conception of justice, drawing here on certain fundamental ideas which he finds ’implicit’ in the contemporary democratic tradition. Next he claims that this political conception will also be endorsed and supported as the focus of an ’overlapping consensus’ among the proponents of various comprehensive religious and moral doctrines that exist in the Western world today. Historic utilitarianism is prominently mentioned as one of these doctrines.

But it is doubtful that the utilitarian principle of general happiness could support the assignment of basic rights - constitutionally guaranteed benefits - to individuals if such rights prevented the utilitarian politician from allowing policies favourable to corporate or aggregate interests to override or supersede constitutional rights when those interests could be seen to conduce to greater benefit. In that sense, then, philosophical utilitarianism is incompatible with the notion of basic rights developed by Rawls, Dworkin and others. For utilitarianism cannot possibly accept a critical justification of a scheme of basic institutions in which constitutional civil rights have a standing priority over policies favouring corporate goods or aggregate welfare.

Much hinges, it would seem, then, on how discussion of the critical justification of rights is set up and conducted. And if questions regarding the distribution of rights are best taken up *after* successful or at least plausible attempts at justification, then such issues as what kinds of beings can have rights are seen to hang in the balance as well.

Currently, we find highly agitated discussions about whether foetuses have rights or whether animals can have them or about limits to the right to life (in cases of mercy killing, for example, or in requests for assisted suicide). But a serious attempt to give answers to questions such as these, questions of distribution and of scope and of defeasibility, cannot be clearly addressed until they can be considered in the light of adequate accounts of the function of rights and with one or more substantive theories of critical justification in hand (see Animals and ethics; Reproduction and ethics).

Sumner, L.W. (1987) *The Moral Foundation of Rights*, Oxford: Oxford University Press.(Referred to in §§3 and 4. This well-written book also represents one of the most important attempts to provide a critical justification of rights on a utilitarian basis.)
Tuck, R. (1979) *Natural Rights Theories: Their Origins and Development*, Cambridge: Cambridge University Press.(A major study - provides a brief early history of rights and an indispensable background to seventeenth-century thought, in particular Hobbes.)
Waldron, J. (ed.) (1987) *Nonsense Upon Stilts: Bentham, Burke and Marx on the Rights of Man*, New York and London: Methuen.(This book consists mainly of excerpts from the three theorists named plus introductions to each by Waldron and, also, a lengthy general introduction and a lengthy concluding essay by him. Valuable for background to discussions on rights in the eighteenth and nineteenth centuries - although weak on Rousseau and on the US contribution. Includes a very useful bibliographical essay.)

Risk

Every day persons face threats from natural disasters such as hurricanes and from technological hazards such as exposure to more than 60,000 different chemicals. The increase of pervasive, human-caused hazards raises a number of philosophical issues, most notably in the areas of ethics and epistemology. There are three main classes of ethical issue associated with risk. (1) Who should define risk, and how should it be defined? (2) Who should evaluate risk, and according to which rules? (3) What are the conditions under which it is ethically acceptable to impose societal risk? Societal risks (such as those from liquefied natural gas facilities) tend to be involuntarily imposed, whereas individual risks (such as those from dietary consumption of saturated fats) are more voluntarily chosen. This discussion addresses societal, rather than individual, risks because they involve less individual choice and hence more ethical controversy.

1 Ethics and risk definition

Moral philosophers use the term ‘risk’ in at least five distinct ways. In the context of ordinary language analysis and normative ethics, a ‘risk’ is the possibility that some harm will occur. In the (second) context of Bayesian decision theory, a ‘risk’ is the probability of an undesirable outcome (see Decision and game theory). Risks are thus distinguished from certain outcomes (having probability 1) and from uncertain outcomes (to which no probabilities can be assigned). In the (third) context of quantitative risk assessment (QRA), a ‘risk’ is the probability that some consequence will occur. Typically a risk is expressed in QRA as the average annual probability of fatality that a particular situation imposes on an individual, such as a coal miner (see Risk assessment). In the (fourth) context of risk-benefit analysis (RBA), a ‘risk’ is the monetary value assigned to some probable negative outcome such as loss of life. A variant of cost-benefit analysis, RBA is used commonly to evaluate whether some risk (such as the use of a pesticide) is worth the benefits. In the (fifth) context of insurance, a ‘risk’ is the chance of loss, often financial loss.

One of the most basic ethical issues associated with risk is how and by whom it is to be defined. Scientists and engineers who study societal risks - such as those associated with toxic waste dumps - typically define ‘risk’ in the third way just mentioned, as the probability that some harm, like death, will occur (National Research Council 1983). Social scientists and philosophers often argue that risk cannot be reduced to a mathematical expression, as in the third definition, because it also is a function of qualitative components (captured by the first definition) such as citizen consent and trust in government risk managers (MacLean 1986). Some moral philosophers also argue that typical definitions of risk exhibit a ‘naturalistic fallacy’ in the sense that they attempt to reduce ethical to purely scientific concepts (Shrader-Frechette 1985).

Much ethical debate focuses on whether societal risk ought to be defined (as in the second, third and fourth senses) by members of the scientific community, or by laypersons (as in the first sense) who are most likely to be its victims. Scientists tend to treat risk definition as the paternalistic prerogative of experts, in part because they claim that the definitions of irrational, ignorant, or risk-averse laypersons could impede social progress (Douglas and Wildavsky 1982) (see Paternalism). Many moral philosophers argue, in return, that rationality is a matter not merely of scientifically defensible outcomes but - because risk affects public welfare - also of just procedures for defining and evaluating risk (Cranor 1992; Shrader-Frechette 1991). Ethicists also claim that because there are no established hazard frequency records for new risks and because scientists have well-known heuristic biases in defining and estimating risks - such as the overconfidence biases in estimates of nuclear risk (Cooke 1993; Kahneman *et al*. (eds) 1982) - it is important to shape risk definitions through participatory democracy as well as by scientific fiat.

2 Ethics and risk evaluation

Still other ethical controversies concern how one ought to evaluate risks. A major issue is whether one ought to judge risk acceptability according to Bayesian or maximin rules. Should one maximize average expected utility (where ‘utility’ is the ability to satisfy some human want and where ‘expected utility’ is the subjective probability of some state multiplied by its ability to satisfy some human want)? Or should one minimize the likelihood of the worst outcome (consequences)? Utilitarians like Harsanyi (1975) argue for the Bayesian position on the grounds that ‘worst cases’ of technological risk occur rarely. They say that maximin decisions are overly conservative,

impede social progress, and overemphasize small probabilities of harm. Egalitarians, many influenced by Rawls (1971), argue for maximin on the ground that the subjective risk probabilities are both uncertain and dwarfed by potentially catastrophic consequences, such as global warming, toxic leaks, or nuclear core melts. They also point out that a small (close to zero) probability of catastrophe does not outweigh infinitely serious risk consequences (see rationality, practical §§6-7).

Other ethical controversies regarding risk evaluation concern whether, in cases of uncertainty where both cannot be avoided, one ought to minimize false positives (false assertions of harm) or false negatives (false assertions of no harm). Following traditional norms, many scientists argue for minimizing false positives on grounds that this stance is conservative, avoids positing an effect where there may be none, and places the burden of proof on those attempting to confirm some harm. Many moral philosophers, however, claim that traditional, pure-science norms for dealing with uncertainty are inapplicable to societal risk decisions because they affect human welfare. They argue for minimizing false negatives because doing so gives greater protection to public health and places the burden of proof on risk imposers rather than risk victims (Shrader-Frechette 1991). More generally, ethicists have challenged the traditional legal dictum that a potentially hazardous substance (such as a carcinogen) is 'innocent until proved guilty'. In cases involving 'toxic torts', they argue that fairness and equal treatment require risk evaluators and decision-makers to reverse the burden of proof, in part because causal chains of harm are difficult to prove and in part because risk victims are less able than risk imposers to bear the costs of faulty risk evaluations (Cranor 1992).

3 Ethics and risk imposition

Apart from the quantitative and scientific rules (such as expected utility) for evaluating risk, the most significant set of ethical issues regarding risk concerns the qualitative criteria under which it is acceptable to impose some hazard (such as chemical effluents) on workers or the public. One important criterion is the equity of distribution of the risks and benefits associated with some activity. Parfit (1983), for example, argues that temporal differences among persons/generations are not a relevant basis for discriminating against them with respect to risk. He and others maintain that a risk imposition is less acceptable to the degree that it imposes costs on future persons but awards benefits to present persons. Commercial nuclear fission, for example, benefits mainly present generations, whereas its risks and costs will be borne by members of future generations (see Future generations, obligations to). Many economists, however, question notions of distributive equity and continue to discount future costs such as deaths caused by hazardous technologies. They also question whether 'geographical equity' (Shrader-Frechette 1993) or 'environmental justice' (Bullard 1993) requires risks to be distributed equally across generations, regions and nations. Proponents of siting hazardous facilities - for example, toxic dumps - in economically and socially disenfranchised areas argue that such risks have been accepted voluntarily and that they provide employment as well as tax benefits. They say that a bloody loaf of bread is better than no loaf at all. Opponents of such risk impositions argue that life-threatening risks rarely bring substantial benefits. They maintain that economically and socially disenfranchised persons typically bear larger burdens of societal and workplace risk.

Economically, educationally, or socially disfranchised persons also are less likely than others to be able to give genuine free informed consent to public and workplace risk (MacLean 1986; Rescher 1983) (see Consent). Some utilitarian ethicists have argued, however, that no instances of consent are perfect, that workers and members of the public have the moral right to trade bodily security for higher wages or economic benefits, and that the greater good is achieved by risk-for-money trade-offs (see Utilitarianism). Ethical debate over such trade-offs focuses on opposed views about rights, paternalism, human dignity, equal treatment, and adequate compensation for risk. On the one hand, many utilitarians and traditional economists believe that the 'compensating wage differential', for example, gives workers in riskier occupations fair or equitable treatment. They also argue that overall economic prosperity justifies the imposition of industry-generated risks and that allowing companies to buy and sell legal rights to pollute leads to the greater good of all. Moreover, they claim that the contemporary federalist economy requires a 'politics of sacrifice' within which guaranteeing free informed consent to all societal and workplace risks is unrealistic and unattainable. On the other hand, MacLean (1986) and others claim that some things (like bodily health and environmental security) ought not be traded for compensation. Gewirth (1982), for example, argues that persons have a moral and legal right not to be caused to have cancer. Philosophers who argue for the ethical justifiability of the economics-safety trade-off tend to be utilitarians, to have more lenient conceptions of free informed consent, to underemphasize sociological differences among those who accept risky jobs and living

conditions, and to believe that pursuing neoclassical economics leads overall to social and ethical benefits. Philosophers who argue against the economics-safety trade-off tend to be egalitarians or social-contract theorists, to have more stringent conceptions of free informed consent, to overemphasize the sociological differences among persons allegedly choosing different levels of societal risks, and to be more critical of the ethical assumptions underlying neoclassical economics.

Another aspect of the consent and compensation debate over risk imposition concerns liability for societal risks. Current US laws, for example, excuse nuclear power plant licensees from full liability for accidents on grounds of economic efficiency and the greater good. Many ethicists argue that such exclusions violate rights such as due process (Shrader-Frechette 1993), legal rights to full administration of the law and to redress under the law.

Apart from the question whether risk victims deserve due process, a related ethical issue is the magnitude of societal risks that ought to be subject to regulation. How far do legal or moral rights to bodily security extend? Ought government or industry be allowed to impose even a minimal risk on persons without their consent (MacLean 1986)? The Delaney Clause to the US food additive amendments, for example, demands a zero-risk level and prohibits the direct addition of any amount of carcinogens to food. For US hazards not related to food, the maximum level of societal risk that can be imposed on the public, without any government regulation, is 10^{-6} (the risk imposes on each person an average annual chance of death of 1 in 1 million). The comparable level for workplace risks is approximately 10^{-3}. Proponents of uniform standards argue that zero risk is unachievable and unrealistic and that economic efficiency and fairness require such standards. Opponents of uniform standards argue that because the public is more averse to some risks, like cancer, different standards (including zero risk) are necessary for different risks. They also argue that all societal and workplace risks should be kept as low as possible, perhaps below the 10^{-6} level, and that uniform standards are too lenient in protecting only ‘average’ persons rather than especially sensitive individuals such as children (Shrader-Frechette 1991).

Apart from the particular norms one accepts for societal risk definition, evaluation and imposition, there is consensus on several general conclusions. Not all societal risks can be reduced by a technological ‘fix’. Not all can be resolved by a legislative ‘fix’ that imposes a hazardous facility on a group without its consent. Not all societal risks can be ameliorated by a public-relations ‘fix’. Most risk problems can be solved only by ethical analysis and democratic process: the most important aspect of risk is not scientific but ethical.

Risk assessment

Probabilistic or quantitative risk assessment (QRA) aims to identify, estimate and evaluate a variety of threats to human health and safety. These threats arise primarily from particular technologies (such as commercial nuclear fission) or from environmental impacts (such as deforestation). Defined in terms of the probability that some consequence will occur, 'risk' typically is expressed as the average annual probability of fatality that a particular activity imposes on one individual. For example, because of normal lifetime exposure to dichloromethane (DCM), a multipurpose solvent, the average member of the public has an annual probability of dying from cancer of 0.0000041 *or (* 4.1×10^{-6} *). Or, for every million persons exposed to DCM throughout their lifetimes, on average the chemical will cause four cancer deaths each year.*

Although risks may be individual *(such as those from consuming saturated fats) or* societal *(such as those from liquified natural gas facilities), government typically regulates only societal risks. By definition, they are largely involuntarily imposed, whereas individual risks affect only the persons voluntarily choosing them. Most QRAs address societal risks, either because a government seeks a scientific basis for particular risk regulations, because some industry wishes to determine possible liability for its processes or products, or because actual or potential victims want to protect themselves or to allocate risks by means other than market mechanisms.*

Philosophical contributions to QRA are of three main types: assessments of particular risks, criticisms of existing assessments, and clarifications of important QRA concepts, methods or theories. Such contributions usually focus on either epistemology (including philosophy of science) or ethics. Epistemological analyses address, for example, the adequacy and appropriateness of some scientific, probabilistic or policy technique used in QRA; the status of a specific causal hypothesis about risk; or the rationality of alternative decision rules for evaluating risks. Ethical analyses investigate, for instance, the equity of the risk distributions presupposed in a specific QRA or by general QRA methodology; the degree to which a particular method of risk evaluation accounts for crucial social values, such as free informed consent and due process; and the extent to which a given QRA technique, such as discounting the future (see Parfit 1983), begs important ethical questions such as rights of future generations.

1 The need for risk assessment

Agricultural, military and industrial technologies typically cause occupational and public fatalities. The World Health Organization estimates, for instance, that normal use of pesticides kills $40,000$ persons every year in developing countries. Even in developed nations like the USA, approximately $100,000$ workers die annually from accidents or exposure to compounds such as toluene or chromium. Members of the public also are at risk, as shown by catastrophes in Bhopal (India), Seveso (Italy) and Chernobyl (Ukraine). For example, experts predict that the 1986 Chernobyl nuclear-reactor accident will cause between $25,000$ and $475,000$ premature deaths from cancer worldwide.

Recognizing the enormity of societal hazards, and spurred by environmental legislation, in the 1960s many governments intensified their efforts in quantitative risk assessment (QRA). By the early 1980s, most regulatory agencies, industries and environmental groups - at least in developed nations - employed decision theorists, economists, engineers, epidemiologists, mathematicians, philosophers, various physical and social scientists, and toxicologists to assess risks associated with many technological activities and environmental impacts. In the USA during the 1980s committees of the National Academy of Sciences and the National Science Foundation developed both methodological standards and research priorities for QRA. Their goals were assisting society in determining which societal risks, relative to others, are likely to be most dangerous or most in need of regulation; protecting public health and safety; distributing societal risks and benefits equitably; and providing a framework for efficient and wise risk management.

2 Three tasks of assessment

Most QRAs include three tasks: risk identification, risk estimation and risk evaluation (National Research Council 1983, 1993; National Academy of Engineering 1986). Assessors perform *risk identification* by looking for clusters of harm associated with some environmental impact or technological activity. In the 1970s, for example, risk assessors identified vinyl chloride as hazardous by noticing the liver cancers occurring among rubber workers

exposed to the chemical. To identify vinyl chloride or other substances as hazardous, assessors need to be able to make a number of causal inferences and to show that particular clusters of disease or death are neither random occurrences nor the result of hidden variables (see Causation).

At the step of *risk estimation* scientists employ sensitive toxicological, biostatistical and epidemiological methods to estimate the population at risk (from a particular hazard), its level of exposure and the associated dose-response curve. By gathering data among affected persons, risk assessors were able to determine, for example, the average vinyl-chloride exposure for rubber-industry workers. Using exposure data, assessors develop a dose-response curve by determining which of many possible curves best explains and predicts the numbers of cases of disease, injury or death as a function of a particular dose of (or exposure to) a substance like vinyl chloride. Because data on humans frequently are not available, assessors usually interpolate and extrapolate from animal data to arrive at a dose-response curve. Particular curves are controversial because data are almost always incomplete and because different curves have different consequences for human health, for government regulations and for industry expenditures to control hazards.

Performing *risk evaluation*, assessors analyse whether a given societal activity - for example, use of commercial nuclear fission - is socially and ethically acceptable, relative to other risks associated with similar benefits. To determine risk acceptability, assessors generally employ economic methods (such as risk-cost-benefit analysis), psychometric techniques (such as expressed preferences or revealed preferences), and ethical analyses (such as weighting risk parameters on the basis of Paretian or Rawlsian rules (Kneese, Ben-David and Schulze 1982)) (see Applied ethics). A major problem with risk-evaluation conclusions, however, is their sensitivity to specific assumptions about measuring preferences, determining social choices, or quantifying risks, costs and benefits. For example, when risk assessors include the value of government subsidies for radioactive waste storage/disposal in their calculations of the costs of nuclear-generated electricity, it is virtually impossible to show a favourable benefit-cost ratio for this technology. Studies that assert the cost-effectiveness of commercial nuclear energy, however, typically ignore the effects of government subsidies - on the grounds that they are external to normal market processes. As this nuclear example illustrates, reliably assessing a particular risk-evaluation conclusion requires one to know both the methodological assumptions and the factual parameters to which the conclusion is most sensitive.

3 Epistemological issues in risk assessment

Because of its emphasis on methodological assumptions, QRA provides a new and important context for investigating traditional questions in epistemology and philosophy of science. Some of these questions, for example, address the realist-versus-antirealist debate over the status of scientific knowledge (see Scientific realism and antirealism). A central controversy in QRA concerns the degree to which both general and particular risk estimates are realistic. Natural scientists, more traditionally oriented philosophers of science, and proponents of normative epistemology tend to be more realist. They argue that although all risk estimates are assumption-laden, they are based on actual characteristics of phenomena that can, in principle, be analysed by mathematicians and scientists. Risk assessors in more realist camps also defend their claims by arguing that obtaining new data (such as accident frequencies) forces analysts to modify their risk estimates and illustrates that their assessments are not purely subjective (National Research Council 1983). Social scientists, more sociologically oriented philosophers of science, and proponents of naturalized epistemology tend to be more conventionalist. Arguing that all risk estimates are socially constructed and that no risk knowledge is unbiased, they claim that all risks are assessed on the basis of social, cultural and methodological values. More conventionalist assessors also maintain that, even if risk estimation were objective, risk evaluation would nevertheless be determined by our perceptions and constructs (Johnson and Covello 1987; Douglas and Wildavsky 1982).

Other epistemological debates over risk assessment mirror continuing metascientific controversies concerning the nature of rationality and the reliability of inductive inferences (see Induction, epistemic issues; Inductive inference). Does Bayesian rationality adequately characterize successful risk evaluation? Are given data adequate to estimate a particular risk? Do expert or lay opinions provide better evaluations of risk acceptability (as opposed to risk magnitude)? Some assessors argue that they, not members of the public, have more reliable knowledge of various risk probabilities and therefore are able to make more rational decisions about risk acceptability (Douglas and Wildavsky 1982). More populist assessors respond that, although laypersons may have inaccurate knowledge

of risk probabilities, lay ignorance in this regard is beside the point. They claim that members of the public have ‘the right to be wrong’ because rational decisions about risk acceptability are less a function of *knowledge* of risk *probabilities* than a function of the *value* they attach to avoiding potentially catastrophic *consequences* and to obtaining benefits from taking some risk (Shrader-Frechette 1985, 1991; MacLean 1986).

Philosophical debates over subjective probabilities and the role of expert judgment are central to QRA because risk controversies typically arise as a result of new technologies and activities. For example, roughly $60,000$ different chemicals are used annually in developed nations. For the $10,000$ new chemicals introduced each year, there are no established frequency records regarding potential hazards. Without such records, there are numerous debates over which estimates and models accurately represent particular risks. It is often not easy to settle these conflicts because of the many inferences, extrapolations and interpolations associated with QRA methods; because ethical sanctions against human experimentation limit available data; because of the expenses associated with long-term epidemiological testing and the large sample sizes or time periods needed to detect small effects, for example, of low-level exposures to toxic substances. In response to conflicts over the estimation of risk probabilities, philosophers of science have proposed new techniques for calibrating the subjective estimates of different assessors (Cooke 1992).

In addition to problems with risk estimation, empirical underdetermination in QRA also causes many metascientific and philosophical controversies over risk evaluation. One conflict, for example, concerns which decision-theoretic rules, are more appropriate to risk evaluation - those based on average expected utility, on maximin, or on some other rule (Giere 1991)? Proponents of expected utility would maximize average welfare in making risk decisions because any other procedure assigns too much weight to small risk probabilities. Proponents of maximin rules argue, in response, that in cases involving probabilistic uncertainty and potentially catastrophic risks, it is more rational to avoid the worst possible outcomes. Defending maximin rules, they claim that rational persons would accept neither potentially catastrophic consequences, even if their probability were low, nor risks with uncertain probabilities (Slovic 1987). Other risk debates focus on whether, in a situation of uncertainty, one ought to make the ‘equiprobability assumption’ that all unknown probabilities have the same value. What is appropriate risk/scientific behaviour in a situation of uncertainty?

Some of the most basic questions raised by philosophers of science interested in risk assessment concern the adequacy of particular causal inferences or predictions. What causal accounts explain a given number of fatalities? When should a scientist claim that the evidence of harm is adequate and therefore abandon the search for confounders (Cranor 1992)? When are analogies between animal models and human models close enough to infer that similar causal processes create similar risks? Or, which scientific accounts (such as hydrogeological models for groundwater flow at hazardous waste sites) adequately explain and predict phenomena relevant to risk estimation and risk evaluation (Shrader-Frechette 1993)? When is a particular scientific model too idealized to be useful in the practical work of risk estimation and evaluation? Why does one risk-estimation curve fit the dose-response data better than another? Is predictive power a necessary condition for explaining risk phenomena? Are assessors justified, especially in cases of potential catastrophe, in making an inference to the best explanation (see Idealizations; Inference to the best explanation; Statistics and social science)?

As the disputes over causal inferences reveal, epistemological controversies regarding QRA frequently concern the methodological adequacy of various techniques of risk assessment. These controversies are likely to persist, so long as we continue to purchase societal progress at the price of increasing particular risks and costs.

Ritual

Ritual, present throughout human affairs and central to many religious and cultural traditions, presents perplexities. One important question concerns the worth of such repetition and fixety - for example, in prayer, in human interaction, sometimes even in eating and drinking. To consider prayer, why not encourage the direct expression of religious thought and affect - from the heart, as it were, rather than in prescribed ways? It is sometimes suggested, and tempting to suppose, that to regularize such expression is to constrict it, ultimately to demean it. It is difficult to locate value in such apparently unnecessary regulation of human affairs.

In the context of philosophy the question becomes striking. None of the prevailing approaches to ethics makes it easy to see how ritual might possess ethical value or figure crucially in the ethical life. Yet this is precisely how ritualized ways are often seen within communities of practitioners.

1 The ethical import of ritual and traditional Judaism

Ethical theory, as we have it, seems unfriendly to ritual. For the Kantian, what distinguishes moral norms is their applicability to all rational agents. Rituals, however, are owned by communities, in whose highly particular and idiosyncratic idioms they speak. Indeed, rituals are sometimes optional even within the community. Nor does ritual come to mind when utilitarians reflect on behaviour that contributes to human betterment. Finally, engagement with ritual does not suggest itself to us, nor did it to Aristotle, as a trait that figures crucially in flourishing.

It will be helpful to examine a tradition or cultural setting in which ritual is taken seriously, in which it has a weighty, even a central, role. The present entry will focus upon traditional Judaism, a highly ritualized, comprehensive system of practice, indeed an inclusive legal system in which ritual permeates areas such as torts, contracts and divorce law. Ritual is pervasive, and since communal customs attain something of the status of law, the domain of ritual increases over time. How are we to think about the ethical status of ritual in the Jewish context?

A striking and suggestive feature of Jewish ritual is its essential role in the tradition's distinctive approach to human flourishing. Flourishing, of course, is the pivotal ethical notion, at least according to Aristotle and his followers.

Aristotle himself did not see ritual as essential to flourishing. Different cultural settings and traditions, however, may yield different ideas about human flourishing. And while not just anything should count as flourishing, a broadly Aristotelian view will want to allow for some latitude. The Aristotelian project as understood here - the empirical study of flourishing, and of the traits of character that contribute to and partly constitute human flourishing - thus becomes applicable to a wide range of cultural settings. Carried out in connection with traditional Judaism, the project yields the conclusion that ritual observance is ethically of the first importance. It is noteworthy that Mencius, in the Confucian tradition, counted *li* - often translated as 'propriety', a trait that centrally involved engagement with ritual - among the virtues.

What is the distinctive approach of traditional Judaism to human flourishing, and how is it that ritual is essential? At the heart of that approach is the conception of developed religious character. Ritual plays an essential role in the growth and sustenance of religious character.

2 Developed religious character: the role of awe

We are apt to think of a deeply religious person as a 'true believer'. However, there is no expression in biblical Hebrew that corresponds to our term, 'believer'. The phrase that comes closest is *Y'rei Adonai*, which means 'one who stands in awe of the Lord'. (The Hebrew expression *yirah*, translated here as 'awe', also means 'fear'. As A.J. Heschel notes, the term and its cognates are used in the Bible primarily in the sense of awe.) This suggests an emphasis on affect, orientation and responsiveness, rather than on the doxastic. Specifically, this Hebrew expression suggests that awe plays a central role. 'Awe rather than faith is the cardinal attitude of the religious Jew', writes A.J. Heschel (*1959*: 77).

One can see why awe might be of special interest by an examination even of quite ordinary - not religiously charged - experiences. Particularly important is a curious duality. In the grip of awe, one feels humbled; in the

extreme case, overwhelmed. At the same time, remarkably, one does not feel crushed or diminished, but rather elevated, exhilarated. This duality - humbled yet elevated - is of great importance for the religious orientation at which Judaism aims. (Needless to say, the features of awe experiences highlighted here and below vary in intensity and relative prominence from experience to experience.)

Awe experiences, perhaps as a consequence of the elevation-cum-humility, characteristically engender generosity of spirit, lack of pettiness, and increased ability to forgive and to contain anger and disappointment. The tradition notably associates just such affect and behaviour with God. Turning to the cognitive, awe experiences engender a Godlike perspective, the ability to see things, or almost see things, under the aspect of eternity, as Spinoza put it. One often also feels a powerful sense of gratitude.

Reflection on awe provides an entry point into the concept of holiness, a concept that is as important to Judaeo-Christian (as opposed to Greek) thinking about flourishing as it is difficult. In the grip of powerful awe, one often feels oneself to be in the presence of something sacred. To destroy the object of such an experience - the Grand Canyon, say - or to allow it to be destroyed, would be sacrilege. If ‘holy’ and ‘sacred’ have any natural application for non-theists, it is in connection with such moments. It is sometimes suggested that such reactions on the part of non-theists reflect the lingering presence of a religious upbringing, or an earlier time in our history. Instead, such reactions might be taken at face value, and as shedding light on the concept of holiness by providing a beginning point for reflection: awe seems to engender a sense of the holy.

These considerations provide a sense of what we might call the religious content of awe, and thus provide motivation for Heschel’s making awe pivotal. At the same time, powerful awe experiences are relatively rare and transitory. How can such uncommon and fleeting experiences bear so great a weight?

It is here that the concept of the *y’re Adonai*, one who stands in awe of God, comes to the fore. What is distinctive about such a religiously developed person is not only the object of awe. Perhaps even more important is the habitual quality, the steadiness, of awe. The *y’re Adonai* is one who has made awe a regular, albeit not a constant, companion. And with awe comes its concomitants: the sense of being humbled and yet elevated, the Godlike tendencies of thought, feeling and behaviour, the perspective *sub specie aeternitatis*, the gratitude, the sense of being confronted by the holy in all sorts of unlikely places. ‘Ordinary’ experiences, interactions with other human beings, for example, or with nature, become encounters with the holy. It has been said that close to the core of the Jewish religious attitude - and this perhaps represents an important contribution of Judaism to culture - is the idea of the sanctification of the ordinary.

To say that awe goes to the heart of the religious attitude is not to say that there are no other important aspects. A more complete treatment than is possible here would need to explore other such features, for example, the love of God, an aspect of the religious attitude that seems related, but not reducible to, awe.

3 Developed religious character: the role of ritual

To attain the heightened responsiveness of the *y’re Adonai* is quite an achievement. What is called for is a substantial change of orientation, a heightened responsiveness, and a deepening of wonder, of appreciation and of one’s character. Effecting such change is intrinsically difficult, and external factors often make it more so. The frailties and limitations of one’s fellows often inhibit their support for such development. And the distractions, discouragements, frustrations and sufferings of the human situation only increase the difficulty.

How then is such character development and sustenance possible? What are the tools by which the tradition means to effect its exceedingly ambitious plan? One often said to be the most fundamental is study of the tradition. Indeed, ‘study’ is not adequate, for it fails to convey the intensity of intellectual engagement. Jewish liturgy highlights an adaptation of Deuteronomy 30: 20, ‘For they [the words and teachings of the Torah] are our lives and the length of our days, and with them we are engaged [or we meditate] day and night’. Saintly personalities throughout post-biblical Jewish history are paradigmatically giants of scholarship, those who quite literally are engaged day and night.

Ritual plays a major role in effecting and sustaining the transformation. Consider the practice of saying blessings: on eating and drinking, on smelling fragrant spices, herbs, plants, on seeing lightning, shooting stars, vast deserts, high mountains, a sunrise, the ocean, on seeing trees blossoming for the first time in the year, on seeing natural

objects (including creatures) of striking beauty, on meeting a religious scholar, on meeting a secular scholar, on seeing a head of state, on hearing good news, on hearing bad news.

Heschel suggests that the practice of saying blessings is training in awe. One develops the habit, before so much as sipping water, to reflect and appreciate. In addition to the blessings' training function, blessings also function as reminders. Ordinary experience is distracting, and the tradition has assembled reminders to assist in maintaining focus.

In addition to occasion-related blessings, Jewish practice includes thrice-daily fixed prayer. Whatever one thinks of the practice of saying occasion-related blessings, the thrice-daily fixed prayer is likely to appear highly constricting. The blessings, at least, are appropriate to one's current experience.

We should remember, however, the magnitude and ambition of the tradition's project. While fixed prayer can degenerate into mechanical, unthinking, unfeeling performance, it offers great opportunities. Some of the usual translations notwithstanding, Jewish liturgy is a compilation of passages of literary magnificence. That such literature, the Psalms, for example, has survived the ages is a tribute to its expressive power, its ability to articulate and illuminate religious experience. To engage regularly with such literature - not merely to read the words but to declare them, to wrestle with them - is to occupy oneself with the tradition's project. The encounter with literature of such power encourages regularization of the attitudes to which it so ably gives voice. Indeed, ritualization turns out to be a great virtue: the agent need not wait until the appropriate experiences present themselves.

Ritualized prayer has another distinct advantage over spontaneous prayer. Spontaneous expressions - for example, of awe - are limited by the expressive capacities of the agent. How many among us are capable of summoning words adequate to powerful experiences and their concomitant thoughts and emotions?

Ritualized prayer does indeed present challenges of its own. The challenge is presented not by the repetition, but rather by the difficulty, the sheer hard work, involved in summoning up the thoughts and feelings appropriate to such literary magnificence. The founder of Hasidism, the Ba'al Shem Tov, is reputed to have said that it would be easier to deliver two advanced Talmudic lectures than to offer a single *amidah*, a fixed prayer of a few pages.

4 Rituals: linguistic and nonlinguistic

The examples of ritual we have been exploring all involve ritualized speech. Rituals need not involve linguistic performance, however, even in the highly word-oriented context of Judaism. Some may involve nonlinguistic behaviour that accompanies speech, as in bowing at appropriate times during prayer. Some may involve pure behaviour, that is behaviour not accompanying a linguistic performance - for example, the donning of a prayer shawl, or of phylacteries, or the burning of the leaven before Passover. These performances are accompanied by blessings (expressive, *inter alia*, of appreciation for the opportunity to perform the ritual), but the blessing accompanies them (and not vice versa). These are distinct from examples in which the action is a mere adjunct to the linguistic performance, for example, in bowing during prayer. Still other nonlinguistic rituals may involve no overt behaviour, as in the practice of hearing the searing call of the ram's horn every day during a month of the year devoted to reflection on the direction of one's life.

Ritualized prayer is ritualized engagement with dramatic and literary representation. It might seem that nonlinguistic ritual is distinctive in that it involves the actual performance of a dramatic representation, as opposed to merely engaging with one, as in prayer. There is, no doubt, something to this. Dramatic representations of ideas, for example, have a power beyond mere discursive articulations of the ideas themselves. It would be difficult to find a verbal equivalent of, say, wrapping oneself in a prayer shawl (where part of what this may mean to the agent is the wrapping of oneself in the tradition). Similarly, the call of the ram's horn is simply not to be equalled by any discursive substitute. Still, we should not forget that to engage in the prayer of Jewish tradition is not simply to read the text. It is rather to declare it, to make it one's own in speech and thought.

For the stranger to ritual, ritual will seem like rote performance, constricting rather than expansive, mechanical rather than expressive. One of the things lacking in such an attitude, according to the advocate of ritual, is a healthy respect for repetition. One who regularly engages with prayer, for example, can come not only to take comfort in the familiar, but also to see, in the repeated sentences, new depths. Since we are speaking of great literature, it will inevitably be the case that different sentences, or different turns of phrase, leap off the page, as

will different emphases, and different meanings and levels of meaning. And what is true of prayer is also true for the nonlinguistic rituals.

For the stranger to ritual, multiplication of ritual forms will seem like a burden. But for one's day to be sprinkled with such dramatic representations is for one's day to be sprinkled with powerful expressions of the attitudes and ethical motifs in question. It is also to be in possession of a multiplicity of reminders, mechanisms by means of which one may retain one's focus.

5 Conclusion

Our look at traditional Judaism suggests that in the right cultural setting, ritual can figure importantly in human flourishing. Having come this far, we can extend the point: whether ritual is ethically relevant for the utilitarian depends upon what counts as well-being. A different sense of what counts as flourishing may indeed yield a different sense of well-being. Even for Kantians, community-based ritual might well come to be seen as ethically relevant, as conducing, say, to an increased respect for persons.

The foregoing suggests that ethical relevance is not a purely formal matter, but depends upon the particulars of the culture or tradition. One might conclude that although ritual may indeed be ethically relevant, it is not so in our cultural setting. One may wonder, however, whether ritualized ways of acquiring, sustaining and celebrating values might play a more useful role than we have allowed.

Rohault, Jacques (1617-72)

Rohault belongs (with Régis and de Cordemoy) to a generation which did much to consolidate the position of Cartesian physics in France. He is particularly famous for his experimental attitude. He contributed to the debate over the physical interpretation of the Eucharist.

Jacques Rohault was born in France at Amiens. Although he obtained a degree at Paris University, he seems to have been an autodidact in philosophy. He was a friend of Cyrano de Bergerac, of Molière and Clerselier (the best-known Cartesian philosopher of his time often cited in conjunction with the editor of Descartes' works), whose daughter Geneviève he married in 1664. Rohault was most famous for his public lectures on Cartesian philosophy, which from 1665 he held in his own house every Wednesday. In 1670 Rohault published *Traité de physique (Treatise on Physics)*, probably based on these lectures, followed by *Entretiens sur la philosophie (Conversations on Philosophy)* (1671). This book is essentially a defence of Descartes, dealing with controversial topics such as the relation between Descartes and Aristotle, Descartes' interpretation of the Eucharist and Descartes' ideas on the animal soul. Both of these works remained influential until the second quarter of the eighteenth century. Other works by Rohault, mostly on mathematics, were published posthumously by Clerselier in 1682.

According to Rohault, traditional natural philosophy is too 'metaphysical'. His own physics, on the other hand, is experimental. Indeed, the experiments and demonstrations were the great attraction of his Wednesday lectures. His concepts, however, are unmistakably Cartesian, although he does believe that Aristotelian concepts like 'matter' and 'form' can be made more precise: matter is extended matter, and forms are the various ways in which matter is modified into particular things. Apart from the fact that Rohault's physics is more complete (at least in terms of contemporary notions) than Descartes' (the *Treatise on Physics* also contains a part on animated bodies), it is also more overtly experimental (he even has a theory of experimentation) and therefore more attractive for students. Moreover, Rohault never claims more than probability for his theories. Physical explanations have the status of scientific hypotheses. They are true not because they are metaphysically warranted but because they provide the best account of experience.

One of the classical objections to Cartesian philosophy in Catholic countries was that Descartes' rejection of 'real accidents' makes it impossible to account for the fact that in the Eucharist the accidents belonging to the bread and the wine continue to exist independently from the original substance (which was changed into the body and blood of Christ). Also the definition of matter as extension (which implies that wherever there is any extension there is matter) would be contrary to the idea that Christ is really present under the dimensions of bread and wine. Rohault's general answer, to which he devoted his first 'Entretien' is that his theory is not contrary to that of Aristotle, so that, given that the traditional theory was based on Aristotle, there is nothing to worry about. Further, that theology and philosophy are mutually independent, so that no philosophical theory can ever be dangerous for theology. His specific reply is twofold. First he maintains that, since 'real accidents' cannot exist independently from a mind that perceives them, there is nothing strange in the fact that after the Consecration, God continues to give us the sensations connected with the bread and wine, although their substance is no longer there. Next he repeats what Descartes himself had said in the Fourth Set of Replies, namely, that the body of Christ affects the senses in the same way as the bread and the wine did because, in replacing them, its physical limits are formed by the same surface. This surface however is not part of the substance as such. Accordingly, the substance can change (the bread can change into the body of Christ), while the impression its surface makes on the senses remains the same.

Roman law

Law was Rome's greatest gift to the intellect of modern Europe. Even today the Roman law library, and the achievements of the jurists who built it up, live on in the law of the Continental jurisdictions and of other countries farther afield. It is true that over the past two centuries codification has largely interrupted the long tradition of direct recourse to the Roman materials, but the concepts applied in civilian jurisdictions and the categories of legal thought which they use are still in large measure those of the Roman jurists. In England, perhaps for no better reason than that from the late thirteenth century the judges of the King's Bench and Common Pleas happened to come from a background which cut them off from the clerical education which had given their predecessors access to the Roman library, there was no reception of Roman law. Post-Norman England thus became the second Western society to set about building up a mature law library from scratch. The common law (being the law common to the whole realm of England) and the civil law (being the ius civile*, the law pertaining to the* civis*, the citizen, initially of course the Roman citizen) thus became the two principal families within the Western legal tradition. It is wrong, however, to suppose that the development of the common law was constantly isolated. There have on the contrary been important points of contact at almost all periods. One result is that the categories of English legal thought are not in fact dissimilar to those of the jurisdictions of continental Europe. The study of Roman law has contributed immeasurably to the idea of a rational normative order, an idea fundamental to legal philosophy as indeed to all practical philosophy.*

1 Markers in time

The first life of Roman law, when it was the law of the Romans themselves, is conventionally allotted to the millennium which is almost exactly divided by the change of era, five hundred years before and five hundred years after Christ. There are convenient markers. Emerging from its prehistory, the tough agricultural society which had recently expelled the last of its kings enacted a crude code, the Twelve Tables, in 451 BC. Nearly a thousand years later, and no longer in Rome but in the predominantly Greek capital of the eastern Roman empire, the Emperor Justinian and his chief minister, Tribonian, carried through a task which to lesser men would have seemed intellectually and administratively impossible. They set up Commissions to read the whole law library and to compact it. The result was two huge volumes and one small one, the *Digest*, the *Codex* and the *Institutes*. These came out in the early 530s AD. Private collections of the emperor's subsequent pronouncements later added a fourth volume, the *Novels*. The four make up what we call the whole body of the civil law, the *Corpus iuris civilis*.

Within this thousand years, the focus of most modern scholarship has been the age of the greatest names, from the reign of Hadrian to that of Alexander Severus, roughly the century from AD 125 to 225. It is sometimes said that the strongest court that ever sat in England sat in York in AD 211, the year that the Emperor Septimius Severus died there, on campaign against the Scots. Papinian was certainly there, possibly also both Paul and Ulpian. One cannot but wish that the three greatest Roman jurists were there. The end of the golden age, the classical period of Roman law, is usually marked by the murder of Ulpian in the summer of AD 223. At the time of the assassination he was the first man in the empire below only the Emperor Alexander Severus himself.

Hardly less interest attaches to the preceding periods, since it is of them that the question has to be asked why Rome, and no other ancient society, managed to develop a mature law library. The end of the beginning was the work of Servius Sulpicius Rufus, who died in AD 43, in the tense months which followed the murder of Julius Caesar, on a mission to Marcus Antonius in Mutina. Pomponius' account of the history of Roman jurisprudence shows that Servius, both a prolific writer and an innovator in methods, more than doubled the number of law books which had been written before his time. He and his distinguished pupils prepared the way for the exponential improvement and expansion of the law library in the pre-classical or, as some would prefer, early classical first century AD, from Augustus to Hadrian.

After the assassination of Ulpian, the great names soon dry up, and in terms of military and political history the empire runs into deeply troubled times, from which it was saved, albeit at the cost of sowing the seeds of later division, by the Diocletianic settlement at the end of the third century. Whether the post-classical period was a time of steep and absolute decline in legal science is now doubtful. The form certainly changed. The responsibility for the interpretive development of the law shifted decisively to the emperor and the imperial bureaucracy, whose

characteristic utterance was the rescript, the written reply to a request for a ruling on the problems arising from a given fact-situation. The jurists who in earlier times would have been the great names achieving personal immortality through their books were now civil servants working in the anonymity of the imperial chancery. Decline and vulgarization cannot be denied, especially in the collapsing West, but the phenomena are more complex than was previously supposed. Although the *Codex Theodosianus*, a collection of imperial pronouncements put together and published in the early fifth century, does evidence a failing grip on the precise use of language, it is broadly true that the centre held. In the sixth century Justinian's Commissions are themselves evidence of complete recovery, based largely on the great law schools of the East at Beirut and Constantinople. Professors of law from those schools were leading members of the Commissions and had without doubt been vigorous advocates of the seemingly superhuman task of renewing the law library.

The western empire is taken to have ended with the abdication of an emperor whose name seems with specious elegance to close a great cycle of history, Romulus Augustulus (475-6). The second life of the Roman law, when its library was taken back into the foundations of western Europe, began about five hundred years after that collapse. From the embers of the western empire there ultimately sprang the European unity of the middle ages, that pre-Reformation Catholic civilization which is now most obviously attested by the great cathedrals and universities. The secular learning of that civilization was law, the law of Justinian's *Corpus iuris civilis*. The University of Oxford owes its existence in large measure to the fact that the Church happened to make Oxford a centre of jurisdiction and administration. By 1150 Roman law was being studied there, if not from the great Bolognese jurist Vacarius then at least from his writings. Oxford was not unique. In the twelfth century law was the study of the age. The appetite of both spiritual and secular powers for competent administrators meant that there were careers to be made by those who knew their law, and this in turn drew jurists out across Europe to spread the learning which was so much in demand. The centre from which this learning radiated was northern Italy. In the universities there a legal renaissance had begun. The study of the *Corpus iuris*, in particular of the *Digest*, had not merely been restarted but had quickly been raised to a remarkably high scholarly level. This legal renaissance is usually dated from the work of Irnerius in the University of Bologna. He died about 1125.

By 1100 the authors whose works contributed to the *Digest* had mostly been dead for upwards of eight hundred years. The generations of medieval professors of law, first the glossators and then the commentators, did not expound their texts as historians, revealing the law of a lost society which had itself changed as it developed through the centuries of its first life. On the contrary, they used the texts for their own time, as though they had all been written yesterday or outside time, and with scriptural authority. With brilliant ingenuity they explained away contradictions which we would recognize as due to juristic disagreement or to historical development. In some areas, though in remarkably few, no intellectual somersaults would suffice, and the Roman materials then had to be supplemented from more recent materials. Feudal land-tenure is one such case. The Romans knew nothing of feudalism.

In short the medieval expositors treated the Roman texts as a law library ready made for themselves and their own conditions of life, supplementing where absolutely necessary. In the sixteenth century humanist scholars reacted both against the scriptural authority of the Roman texts, with its tendency to stifle thought and undervalue contemporary experience, and against the intellectual dishonesty implicit in an unhistorical approach to the texts. Scholars such as Cujas (1522-90) and Hotman (1524-90) advocated and pursued a more critical and historical approach, more in the style of modern Roman lawyers who, relieved of the burden of adapting and applying the Roman law library to contemporary conditions, aim chiefly to rediscover the Roman law as it was and as it differed between, say, Sabinus in the first century, Julian in the second and Ulpian in the early third. Since the dissident humanists were mostly French, their critical historicism became known as 'the French way' (*mos Gallicus*) as opposed to 'the Italian way' (*mos Italicus*).

2 The *Corpus iuris civilis*

The work of Justinian's Commissions is the fulcrum upon which the story turns. The *Corpus iuris* sums up the first life of Roman law, and its rebirth in the West begins the second. Certain aspects of the work come as a surprise. The *Digest*, twice the size of the Bible, has 432 titles. One, for example, is 'Marriage', another 'Formation of the Contract of Sale' and another 'Theft'. Under those and the other headings the law was stated, not in the words of the Commissioners, but by their choice of extracts from the works written by the classical and pre-classical

authors. The book is thus a classified anthology of excerpts, each one carefully attributed.

The excerpts from the jurists as we see them have to a certain extent been managed. Many have been abbreviated, or doctored so as to be able to stand alone. Some routine modernizations have been introduced. Some imperfections and impurities in the manuscript tradition have survived. But, while these species of interpolation or disfigurement are not to be denied, few scholars now believe in the wholesale rewriting by the Commissioners that was suspected by many Romanists earlier in this century.

The *Codex* is somewhat less huge than the *Digest*. It is also a classified collection of material, but the matter collected, and once again managed by abbreviation and so on, is different. The *Codex* collects the pronouncements of the emperors, chiefly rescripts. The relationship between the two great books is chronological. The *Digest* compacts the library of the classical and pre-classical periods, while the *Codex* is the book of the post-classical period, when the imperial chancery monopolized all forms of authoritative utterance. Because in reality there was no abrupt transition from classical to post-classical or from private to nationalized utterance, there is some chronological overlap between the two volumes. The word ‘codex’ has nothing to do with codes and codification. It means ‘book’ and, in particular, the kind of book with pages and a spine. The transition from scrolls to that kind of book, the greatest revolution in information storage before printing and the computer, was complex but is generally located in the third century. The codex was thus the medium of the age which is represented in Justinian’s ‘Book’.

The *Institutes* was by comparison tiny. In size it is to the *Digest* much as St Matthew to the Bible. The genre can be traced back to Gaius in the second half of the second century. Indeed Justinian’s *Institutes* is essentially a new edition of the work of Gaius and actually re-uses substantial parts of the original. Gaius himself was long denied the full credit, because through the whole second life of Roman law no copy of his *Institutes* was known to have survived until in Verona in 1816 one was miraculously discovered, overwritten, by Niebuhr. Of Gaius himself we know only what can be wrung from his writings. It seems likely that he was a teacher of law. He certainly had a strong interest in legal history and believed that full understanding of an area of law could only be achieved by trying to go back to the beginning.

The function of the Institutes was to provide a coherent map of the whole law. It had a fixed place in Justinian’s scheme of legal education. Most of the first year was to be spent studying this overview of the whole law. Even deep in the jungle of the *Digest* and *Codex*, the mind thus formed would never be lost. This is an educational lesson that the contemporary study of law, throughout the civilized word, had taken to neglecting. However, in that the mind cannot dispense with categories, least of all the legal mind, jurisprudence cannot safely continue to neglect the fundamental categories of legal thought and their relation one with another (see Legal concepts).

3 Intellectual achievements

There are many negatives. The jurists were not interested in jurisprudence in the narrow modern sense, meaning legal philosophy. Cicero (§2) engaged in some discussion of the nature of law and its relation with the state and political theory, but Cicero, a contemporary of Servius Sulpicius, lived in the period before the law library had put on any weight; and he was, anyhow, not a jurist. Roman law produced no Austins, Kelsens, Harts or Dworkins. Next, from the standpoint of social justice there was little to admire. Slavery was an unchallenged feature of the Roman legal landscape. Again, access to justice was not obviously of much concern. It was a rich man’s system. Politically, the picture is equally grim. Though lawyers could fairly claim to have been a moderating and a stablizing influence, the constitutional structure within which they worked had no democratic aspirations. Indeed as time went on its tendency was to ever more absolute autocracy.

What can there be left? The question needs to be answered against an awareness of two facts. First, the requirement of justice that like cases be treated alike requires that legal science achieve stable analyses and solutions of a multitude of problems of responsibility, problems over which moral philosophers have the luxury of continual debate and uncertainty. The requirement of stability, not, be it noted, morbid rigidity, adds a dimension of intellectual difficulty to law which is absent from ethics and goes some way to explain why Blackstone presented law as the highest branch of ethics. Second, there is the not unrelated fact, perhaps naïve-seeming but none the less true, that there is a vast amount of law which is to a large extent politically neutral. For example, unless the very concept of private property is rejected, it is necessary to know what interests in land and material

goods can be held by individuals and how they are acquired, transferred and inherited. Again, raising the level of magnification, a mature legal system must be able to say exactly how a sale works, how the contract is formed, how it differs from neighbouring transactions such as hire and exchange, what obligations as to quality and title the seller undertakes, when the risk of damage passes to the buyer, at what moment and by virtue of what acts the buyer becomes owner. These and many other questions need stable answers applicable or adaptable to all imaginable versions of the facts. The analyses and their implications for litigation are likely to be more or less immune to politico-moral upheavals in the larger structures of society. If this were not so, it would be difficult to explain how it could be possible for medieval and early modern Europe to borrow the law library of an ancient and largely alien society.

The intellectual achievement of Roman law has to be seen at two levels. One is represented by the *Digest* and the *Codex*, the other by the *Institutes*. In large matters these great volumes are thoroughly disordered, rather as the English common law of the nineteenth century was, and today largely remains, in structural disarray. Nevertheless, when focused on matters of detail - when is legacy invalid, what if a neighbour's activities threaten damage or if he refuses you access to the aqueduct which brings your water across his land, what if a buyer is mistaken as to the thing bought, can an owner ever steal his own property, is it possible for a person to own a wild animal? - the jurists achieved a level of stable analysis unsurpassed by modern legal science. The acid test is whether, and how often, the intellect of the law is defeated by novel or unusual facts and driven back to abstract appeals to justice and good sense, alias gut reaction or mere personal prejudice. Although there were of course disagreements and uncertainties, some of them long unresolved, the ordered intellect of jurists such as Papinian, Paul and Ulpian was rarely defeated in matters of detail. Their concepts and methods set a standard of legal rationality which both challenges modern law and legal philosophy and explains the continuing importance of these practical and untheoretical jurists.

The second great intellectual achievement is represented by the *Institutes*. When he wrote his book, or delivered his lectures, Gaius developed a way of looking at the whole law in such a way that all the parts related intelligibly to each other. Mediated through Justinian's *Institutes* with some minor modifications, Gaius' scheme has dominated legal thinking ever since, and, though there have been bold attempts to escape it or improve it, it has by and large survived. Like many great intellectual advances it has about it a simplicity which almost defies attempts to recreate the pre-existing situation in which people had to do without it. Common lawyers, no strangers to serious disorder, can probably do it better than civilians (see Common law).

One kind of disorder, of which English law is overfond, is the alphabetical list of topics, but that was not quite how Roman law was before Gaius. It should rather be conceived as a historically determined list of actions (that is, of claims claimable), each having attracted its own packet of juristic interpretation. Thus the action of debt, called the *condictio*, was, only slightly simplified, 'I say you ought to give me 1000'. Generations of juristic tradition then built up a detailed commentary on that claim, showing who could make it, against whom, and, especially, what facts would as a matter of law substantiate it. Models of all the claims were set out and publicly displayed in the edict of the minister responsible for litigation, called the Urban Praetor. And if you knew all that the law library had to say about each one you knew virtually the whole law, albeit thrown together in a heap.

The institutional scheme put that heap in order. In Justinian's version, only minutely different from that of Gaius, it affirmed that the law was either public or private. Public law had the barest toe-hold in the *Institutes*, represented by the pages on the constitutional sources of law at the very beginning and the single chapter on crime at the end. Private law, the meat of the book, was first divided into three: all private law was about persons, things or actions - persons who make and defend claims, things claimed, and claiming. The law of things, essentially the law relating to assets of all kinds, was the largest of the three divisions of private law: assets were either corporeal, like land or a ship, or incorporeal. Incorporeal things were different kinds of right, rights over other people's property, such as a right of way or water, the right of inheritance, and rights to compel another person to make a performance, called (from the other end of the relationship) obligations. Obligations in turn arose from contracts or from wrongs or as though from a contract or as though from a wrong. Of course the *Institutes* is not just a diagrammatic representation of the law, like a family tree. At every level of classification it introduces the reader to the substance, so that it both reveals how the different areas of the law fit together and introduces the reader to the general nature of each one.

In the early modern period jurists who considered themselves emancipated from dependence on the Roman texts and wanted to write in their own language and of the contemporary law of their own country still used the scheme of the *Institutes* to provide their structure. In the seventeenth century Grotius did so in his *Introduction to the Jurisprudence of Holland*; and in Scotland Mackenzie did the same, as in the next century did Erskine. Scotland also provides a particularly fine example of a jurist who wrestled with the Roman scheme and hoped to improve it. Viscount Stair, a contemporary of Mackenzie, argued that the law of persons should be eliminated and, since the different conditions of persons were reflected in the different incidence of obligations, absorbed into the law of obligations.

Just as the *Institutes* either provided the structure of law books or the structure against which the author reacted, so also, when from the late eighteenth century the movement for codification gathered momentum on the continent of Europe, the codifiers either followed the institutional scheme, as in France, or sought to improve upon it, as in Germany. In fact, however, even the improvers, whether codifiers or authors, always left a good deal of the Roman scheme intact. It thus remains true that one who knows the *Institutes* is instantly at home in any of the civil codes, as also in the legal bookshops of the Continent. More remarkably, but rarely noticed, the categories of English legal thought and the curricula of English law schools reflect the same enduring influence. It is not by fortuitous parallelism that English law students read books and attend courses on contract and tort (or, as is becoming fashionable, on obligations), on property and on succession, and, on the public law side, on criminal law and constitutional law.

Classification lies at the foundation of legal rationality. The best evidence of the Roman genius for law is that the lawyers of Europe still use their scheme. It is a tribute both to Gaius and to the power of the teacher of law that if today we want to understand the categories of modern legal thought, or to improve them, we still have to follow generations of earlier lawyers in making ourselves thoroughly conversant with the *Institutes*.

(1990) *The Law of Obligations: Roman Foundations of the Civilian Tradition*, Cape Town: Juta.(This is a great work of comparative legal history which, confining itself to the law of obligations, shows how the Roman law was developed into the *ius commune* of Europe and then fixed in different forms by Continental fashion for codification. The author makes constant reference to parallels in the development of the common law. Though long and detailed, the book is extremely accessible even to the reader from the Anglo-American tradition.)

Romanticism, German

Because Romanticism has many meanings which vary according to time and place, it is best to examine the movement in a specific culture and period. Of all the phases of Romanticism, early German Romanticism is of special importance in the history of Western philosophy. The early German Romantics - Friedrich Schlegel, Friedrich von Hardenberg, Schleiermacher and Schelling - developed influential ideas in the fields of metaphysics, ethics, aesthetics and politics. The aim of their movement was essentially social and political: to overcome the alienation and disenchantment created by modernity, and to restore unity with oneself, others and nature. In accord with this aim, the Romantics advocated an ethics of love and self-realization, in opposition to hedonism and the Kantian ethic of duty. They championed an ideal of community against the competitive egoism of modern society; and, finally, they developed an organic concept of nature against the mechanistic worldview of Cartesian physics. Romantic ethics, politics and aesthetics should all be seen in the light of their essential cultural goal: to cure humanity of homesickness and to make people feel at home in the world again.

1 Intellectual geography

Romanticism was a European-wide literary and artistic movement, appearing chiefly in Germany, England, Italy and France, but also in virtually every other country. It began in the late eighteenth century, fully blossomed by the 1830s and began to dissipate by mid-century; some currents continued until the late nineteenth century. Although Romanticism is usually understood as an artistic or literary movement, it also has an important place in the history of philosophy. While rarely systematic, the Romantics developed original and influential ideas in epistemology, metaphysics, ethics and politics.

Considered in all its breadth, it is impossible to generalize about Romanticism. The movement differed from country to country and underwent many changes, one stage often contradicting another. To make any generalization about Romanticism, therefore, it is necessary to limit oneself to a specific time and place. It is best to begin with German Romanticism, partly because its ideas were deeply influential elsewhere, and partly because, in many respects, it marks the beginning of the movement as a whole.

German Romanticism is often divided into three phases: *Frühromantik* (early Romanticism) from 1797 to 1802; *Hochromantik* (high Romanticism) from 1803 to 1815; and *Spätromantik* (late Romanticism) from 1816 to 1830. From a philosophical viewpoint, the most important phase was *Frühromantik*, which flourished chiefly in the literary salons of Berlin and Jena. The leading figures of the early Romantic circle were August Wilhelm Schlegel (1767-1845), his brother Friedrich Schlegel (1772-1829), Ludwig Tieck (1773-1853), Wilhelm Heinrich Wackenroder (1773-1801), Friedrich Schleiermacher (1768-1834), and Friedrich von Hardenberg (1772-1801), chiefly known by his pseudonym ‘Novalis’. Other important thinkers on the fringes of this circle and connected with it in various ways and from time to time include Wilhelm von Humboldt (1767-1835), Friedrich Hölderlin (1770-1843) and August Ludwig Hülsen (1765-1810). The most important philosophers of the circle were Friedrich Schlegel, Schelling, Schleiermacher and Novalis. It is chiefly their views that are summarized below.

2 The early Romantic agenda

Early German Romanticism grew out of a disillusionment with some of the fundamental tendencies of modernity, more specifically the growth of science and technology, the division of labour, and a competitive market economy. For the Romantics, these tendencies had created the fundamental malaise of modern culture: alienation or disenchantment. There were three facets to this alienation: that people had become divided from themselves, from others and from nature. Each facet was the result of one of the tendencies of modernity. People became divided from themselves because of the increasing division of labour, which forced them to ignore their inner selves for the demands of productive labour, and which made them neglect the diverse sides of their humanity to specialize in one activity. They became divided from others because they had to compete in the market place rather than cooperate with them in a community. And they became divided from nature because the sciences treated it as an object to be dominated and controlled instead of a realm of beauty, mystery and magic (see Alienation).

The Romantics’ reaction to modernity has to be placed within the context of their general philosophy of history. They see history, along the lines of the Biblical myth, as a drama of innocence, fall and redemption. Kant and

Schiller had shown how this myth could be rationalized and secularized in explaining moral development; the Romantics duly followed this lead, applying the myth to all history. Innocence consists in unity with oneself, others and nature; the fall starts with division and alienation; and redemption consists in re-achieving unity after division. The present modern epoch is the depth of the fall. The task of the modern human is to achieve redemption by recovering unity with the self, others and nature.

The Romantics saw the rise of modernity as tragic, as the inevitable product not just of capitalism but of civilization. They looked back with nostalgia to earlier cultures, such as those of ancient Greece and the High Middle Ages, which enjoyed much greater unity. But their pessimism was also tempered by the optimism of their utopian belief that it was still possible for modern humans to approach redemption, even if they could not achieve it. If people directed their energies in the right direction, they would be able to recreate through reason that unity with the self, nature and society given to earlier humans through nature.

Hence the Romantic agenda sought to heal the wounds of modernity: to restore unity with the self, with others and with nature. They wanted everybody to become a whole person again, so that each realizes their unique individuality and all their distinctively human characteristics. They championed a community based on love and cooperation, rather than a society torn by self-interest and competition. And, finally, they hoped to restore the beauty, magic and mystery of nature in the aftermath of the ravages of science and technology.

3 Aestheticism

Early German Romanticism has often been understood as an aesthetic or literary movement. The Romantics indeed saw art as the highest form of human experience and self-expression, making it their instrument for the education and redemption of humanity. Romantic art had a definite objective, set by the Romantics' social and political agenda to restore the unity with the self, society and nature that had been destroyed by modernity. In this regard, the Romantics were deeply influenced by Schiller's programme for the aesthetic education of humankind, which gives primacy to art as the means to restore humanity to wholeness.

The early Romantic aesthetic, especially as defined by Friedrich Schlegel, has its origins in Schiller's reflections on naïve and sentimental poetry. According to Schiller, the poetry of the ancients was naïve because it simply and directly imitated nature; naïve poetry thus reflected the ancients' harmony with the world around them. The poetry of the moderns, however, is sentimental because it expresses a sentiment or feeling: the *longing* to return to that unity with nature that had once been given to the ancients.

Schlegel believed that Romantic poetry should adopt some of the characteristics which Schiller had attributed to sentimental poetry. It should be free of all the constraints of classicism, allowing the poet to express the freedom characteristic of modernity; but it should above all express the feeling and longing of the poet, the striving to return to unity with the self, society and nature.

Novalis' definition of Romantic art should also be understood in the same context. The aim of the artist, Novalis wrote, is *to romanticize* the world, to see the infinite in the finite, the extraordinary in the common place, the wonderful in the banal. Here again the mission of Romantic art was to restore unity: its purpose was to restore the magic, mystery and beauty of nature that had been lost with the growth of science and technology.

Romantic aestheticism has often been dismissed as quixotic, because it seems to exaggerate the power of art to motivate human action and to reform morals. But the Romantic faith in art should not be understood simply as a claim about the influence of the arts, and still less as a claim about their autonomy. Rather, Romantic aestheticism is based on the classical equation of the good with the beautiful. The Romantics believe that beauty should have a central role in culture because they think that beauty is involved in all forms of perfection, whether individual, social or political. The Romantic ideal of a self-realized person, of the ideal society and of the perfect state is that they should be aesthetic wholes. Hence the aim of the Romantic was not only to produce good poems, plays and novels, but first and foremost to make the individual, society and the state into works of art.

4 Ethics

The Romantic ethic is best understood in terms of a response to the classical question of the highest good, to the problem of the supreme value of life. The Romantics saw the highest good as *Bildung*, loosely translatable as

education or personal development. Theirs was an ethic of self-realization, which stressed the development not only of one's individuality but also of all one's characteristic human traits. This view of the highest good should be seen as a reaction against the two prevalent views in the late eighteenth century: hedonism and the Kantian-Fichtean ethic. According to the hedonists, the highest good is pleasure, while according to Kant and Fichte it is happiness in accord with virtue.

The Romantics rejected pleasure as the highest good because it would not develop those powers characteristic of our humanity and individuality. Their critique of hedonism is most apparent in their indictment of the philistines, those who devote themselves to a life of comfort and security at the expense of the real self.

The Romantics saw two fundamental difficulties for the Kantian ethic. First, Kant and Fichte had stressed reason at the expense of sensibility, ignoring how our senses are just as much a part of our humanity and just as in need of cultivation and development. It is not simply a purely rational being who acts morally but the whole individual who does their duty not contrary to but from their inclination. Second, by emphasizing action according to universal laws, Kant and Fichte had failed to see the importance of individuality.

The fundamental ethical value for the Romantics was love, which they believed should be the basis of social life and the heart of personal development. They pitted their ethic of love against the egoism of modern society, and the abstract and artificial commands of the Kantian-Fichtean ethic. They saw no conflict between the demands of love and individualism: the individual could become a unique whole only in virtue of love, which is the source of all personal development. Love rather than law was the chief social bond, holding that the state could become secure only through ties of affection and brotherhood.

5 Politics

The early Romantics came of age in the 1790s, a decade dominated by the French Revolution. Not surprisingly, their social and political ideals were formed in the crucible of that epochal event. At first they celebrated the Revolution as the dawn of a new age, embracing the ideals of liberty, equality and fraternity. As moderate republicans they believed that an ideal constitution should be a mixture of democracy, aristocracy and monarchy. They became progressively disillusioned with the Revolution, however, when they fully realized its cultural implications, and were horrified by the egoism, materialism and anomie of modern French civil society, which seemed to leave no place for community and spiritual values.

Because of its reaction against modernity, it would seem that Romanticism was, or at least became, an essentially conservative movement. Some of the Romantics were indeed eager to preserve some traditional aspects of European society, such as guilds and monarchy, because they saw these as a source of community and as a bulwark against materialism. Some looked back with nostalgia upon the society of the Middle Ages, which was more devoted to communal and spiritual values.

It is necessary, however, to place the Romantics' traditionalism in the context of their general social and political values. What they especially wished to maintain in traditional society was its pluralistic structure, its autonomous guilds and local corporations. They valued such a pluralistic structure chiefly because they saw it as a safeguard of liberty and a bulwark against tyranny. They were critical of all forms of political centralization and absolutism, whether it came from a revolutionary dictator or an absolute prince. In this regard they were moderates, as critical of the *ancien régime* as of the Revolution in France.

For all their disillusionment with modernity, the early Romantics endorsed one of its fundamental values: freedom of the individual. They never ceased to embrace this ideal, seeking to liberate the individual from all forms of oppression, whether political, social or cultural, so that people could fully realize and develop their individuality. Friedrich Schlegel, Humboldt and Schleiermacher were early champions of sexual liberation, of the right to divorce and to love without marriage. The main political problem for the young Romantics was how to square the freedom of individuality with the need for community. Their solution was a pluralistic society, whose autonomous groups would provide for community while serving as a defence of liberty.

6 *Naturphilosophie*

One of the characteristic products of early Romanticism was *Naturphilosophie*, which flourished in the first decade

of the nineteenth century (see Naturphilosophie). Its chief representative was Schelling, but it is important to see that he was only one figure in a much wider movement. Other important *Naturphilosophen* include Carl August Eschenmeyer (1771-1852), Lorenz Oken (1779-1851), Franz von Baader (1765-1841), Johann Wilhelm Ritter (1776-1810) and Gotthilf Schubert (1780-1860). It would be wrong to see all these thinkers as forming a single school, for they usually worked independently and were often critical of one another. Nevertheless, they did have some common characteristics: the vision of humans and nature as a unity, the attempt to see all the various phenomena of nature (magnetism, gravity and electricity) as manifestations of a single fundamental force, and a rejection of the old mechanical physics. The impetus for *Naturphilosophie* came from several sources: Kant's dynamic concept of nature, Herder's vitalistic pantheism, Goethe's natural investigations, and the vital materialist tradition of the English freethinkers and French *philosophes* (see Herder, J.G.; Goethe, J.W.).

Naturphilosophie developed from the Romantic concern to overcome the alienation between humans and nature. It saw the fundamental expression for this alienation in the Cartesian mental-physical dualism. The ultimate source of this dualism lay with the concept of matter and the mechanical model of explanation of Cartesian physics. According to Descartes, the essence of matter consists in inert extension; and we explain matter only if we show how the motion of one body is caused by the motion of another body upon it. This concept of matter and paradigm of explanation seemed to make the explanation of the mind impossible according to natural laws. Consciousness is not within space, and hence we cannot explain its changes by the impact of other bodies on it. If we follow Descartes' paradigm of explanation, the only options then seem to be dualism or materialism (see Descartes, R. §8).

Responding to this dilemma, Schelling developed a dynamic concept of matter, according to which the essence of matter consists in living force or power. The advantage of this concept of nature is that it seemed to surmount the dualism between the mental and the physical: they are now simply differing degrees of organization and development of living force. Mind is the highest degree of organization and development of the living forces of matter, while matter is simply the lowest degree of organization and development of the living forces of the mind (see Panpsychism).

For Schelling, the fundamental category of *Naturphilosophie* is that of an organism. He extends this metaphor to all nature, so that we should regard all nature as one vast organism, and mechanism itself as only an appearance of it. In his 1798 *Von der Weltseele (Of the world-soul)* Schelling explicitly revived the ancient Stoic doctrine of a single soul pervading all of nature. His general vision of nature could be described as a vitalistic monism or as a monistic vitalism.

Rorty, Richard McKay (1931-)

Richard Rorty is a leading US philosopher and public intellectual, and the best-known contemporary advocate of pragmatism. Trained in both analytic and traditional philosophy, he has followed Dewey in attacking the views of knowledge, mind, language and culture that have made both approaches attractive, drawing on arguments and views of the history of philosophy from sources ranging from Heidegger and Derrida to Quine and Wilfrid Sellars. He takes pragmatism to have moved beyond Dewey by learning from analytical philosophy to make 'the linguistic turn', and from Thomas Kuhn that there is no such thing as 'scientific method'. Language and thought are tools for coping, not representations mirroring reality. Rorty's characteristic philosophical positions are what might be called 'anti-isms', positions defined primarily by what they deny. In epistemology he endorses anti-foundationalism, in philosophy of language anti-representationalism, in metaphysics anti-essentialism and anti- both realism and *antirealism, in meta-ethics ironism. He extols pragmatism as the philosophy that can best clear the road for new ways of thinking which can be used to diminish suffering and to help us find out what we want and how to get it. In the public arena, he is a leading exponent of liberalism and critic of both left and right.*

1 Life

Rorty's philosophical training at the University of Chicago and Yale University grounded him in the history of philosophy and the main currents of pragmatism and traditional philosophy dominant in the USA in the first half of the twentieth century, as well as the techniques and goals of the analytical philosophy then winning the allegiance of younger philosophers. Starting in the 1960s, he published articles and reviews addressing a wide range of philosophical subjects, the philosophies of thinkers as disparate as Whitehead, Dewey, Royce, Austin and Wilfrid Sellars, and, always, the metaphilosophical issues that arise from the multiplicity of conceptions of philosophy and its methods. He surveyed these metaphilosophical issues from a pragmatist point of view in the introduction to his anthology *The Linguistic Turn: Recent Essays in Philosophical Method* (1967). During the later 1960s and the 1970s he won wide recognition as a leading contributor to debates in the philosophy of mind, metaphysics, epistemology and the philosophy of language, staking out radical positions in each of these fields and drawing on the attacks on the philosophical tradition in Heidegger, Derrida, the later Wittgenstein and especially Dewey. He reached the first rank of US philosophers and won international attention outside philosophical circles with the publication of his major work *Philosophy and the Mirror of Nature* (1979). This book brought together all his lines of thought in an attempt to get philosophers, and those who look to philosophy to lend authority to their own cultural activity, to abandon the views of knowledge, mind, language and culture which give appeal to movements like analytic philosophy that claim to put philosophy on the true path of a science. Since then he has, in many articles, reviews and lectures, extended his attack on that philosophical tradition. He has defended his version of pragmatism as the best way of thinking about those things philosophers should still be thinking about; he has sought to place his thought in relation to an ever-widening range of other twentieth-century writers both within and outside philosophy (for example, Castoriadis, Davidson, Dennett, Foucault, Freud, Habermas, Lyotard, Nabokov, Orwell, Putnam and Roberto Unger) and to make pragmatism useful to workers in other areas (for example, feminism, education, jurisprudence and literary criticism). And he has taken up the role, well-established in Europe but rare among philosophers in the United States after Dewey's death, of a public intellectual, commenting in articles and interviews in journals of general circulation on affairs of common interest in democratic societies. Rorty's wide command of modern philosophy is remarkable, as is his dialogue with a broad spectrum of philosophical movements, and he is unusual also in giving credit to a number of other thinkers (Dewey, Heidegger, Davidson, Freud, Kuhn, Dennett, Quine, Sellars, Derrida, Nietzsche) for most of the key ideas in his writings. (Dennett, however, has enunciated the *Rorty Factor*: 'Take whatever Rorty says about anyone's views and multiply it by .742' to derive what they actually said.) Many of his most important papers and lectures have been collected in four volumes (listed below). Having urged a break with the traditional project of philosophy, he left the philosophy department at Princeton University to become a professor of humanities at the University of Virginia in 1982.

2 Metaphilosophy

Rorty takes the three models of philosophy most attractive to contemporary philosophers to be the scientistic (Carnap), the poetic (Heidegger) and the political (Dewey); he endorses the last as most congenial to pragmatism.

Philosophers should emulate the moral virtues which scientific communities have exemplified, but give up belief in ‘scientific method’ as well as philosophical method. They should foster the invention of new metaphors that is the work of poets and prophets, creating new vocabularies and social hopes; but philosophers have no special mission to be either poets or prophets. Philosophy should be hermeneutic, helping different areas of culture to make contact with each other and to sort out conflicts, just as liberal politics tries to find a working relationship among the different and conflicting desires and hopes at play in the world (see Hermeneutics). Its most important task now is to clear away past bad philosophy and bad ideas that are getting in the way of thinking usefully about, and doing, what can be done to make people happier.

As his metaphilosophy suggests, Rorty’s characteristic philosophical positions are what might be called ‘anti-isms’, positions defined primarily by what they deny. In epistemology he endorses anti-foundationalism, in philosophy of language anti-representationalism, in metaphysics anti-essentialism and anti- both realism *and* antirealism, in meta-ethics ironism (see Foundationalism; Essentialism; Realism and antirealism). None of these is a theory but, rather, a collection of considerations for the rejection of theorizing in these areas.

3 Knowledge and truth

Rorty’s anti-foundationalism, drawing on arguments of Quine and Wilfrid Sellars, denies that the justification of our knowledge claims must or can terminate in beliefs or statements that provide a foundation for knowledge. Nor does Rorty think that knowledge has any other overall structure. On his view (epistemological behaviourism), one justifies a belief or statement by adducing other beliefs or statements that do not require justification in that context, so as to satisfy the standards implicit in our social practice of justification (see Contextualism, epistemological). He consequently denies both that scepticism is a problem for philosophy and the theories whose appeal is that they purport to solve the problem of scepticism (see Scepticism). Rorty’s anti-foundationalism also denies that there is some particular discipline or part of culture that has the job of providing justification for, or making sense of, all the rest. In particular, he insists that it is a mistake to try to justify practices and institutions like liberal democracy, academic freedom and scientific research by appeal to philosophical theories that show them to correspond to or be in touch with the ultimate nature of reality or the human self or the will of God or something else bigger or deeper than our actual practices. This is not the view that such practices do not need any justification, which some critics have accused Rorty of holding, but rather that appropriate justifications will always be piecemeal and local (see Justification, epistemic §7).

Epistemological behaviourism is an account of justification but not a theory of truth. Rorty denies that there is any interesting theory of truth, that is, any general account of what makes beliefs and sentences true. He endorses James’ dictum that the true is just the good in the realm of belief; there is no general account of why beliefs are true any more than there is a general account of why things are good. He rejects correspondence theories and coherence theories of truth alike. His anti-representationalism denies that the essence of language is to represent or picture reality in such a way that bits of language match up with bits of reality; languages - the noises, gestures and marks we humans make - and thoughts - the brain states we get into - are part of the repertory of devices we have accumulated for coping with the world (including ourselves). While some stretches of language or thought might work by such matching-up techniques, these stretches have no special privilege or philosophical importance. Rorty rejects both realism and antirealism (or idealism) as products of a misguided representational view of language. No class of truths has foundational status with respect to the rest of the truths. While we usually call beliefs true when they are better justified than their competitors, ‘true’ does not *mean* ‘justified’ or ‘warranted’; it is indefinable and ineliminable.

Since there is no foundation for truth or knowledge, there is nothing outside our social practices to ground them, according to Rorty. Hence, he has sometimes rejected objectivity as a goal of inquiry (and objective-subjective as a relevant dimension of appraisal in the cognitive realm) in favour of solidarity with our community of inquirers; less provocatively, he urges that objectivity be understood as intersubjectivity or taken as shorthand for practices, like not taking bribes, that we have found very helpful in most kinds of inquiry.

Rorty is often accused of relativism and as often rejects the accusation. He claims that relativism about truth is easily refutable. The alternative to relativism about justification that he espouses is ‘ethnocentrism’, the view that justification is relative to *our* practices. The defence of our beliefs against challenges by other communities (Nazis, religious fundamentalists, the Nuer) must always be question-begging, but this does not vitiate the defence, since

no other kind of defence is better or even as good, and appraisal must always be against relevant alternatives (see Cognitive pluralism).

Opponents with epistemological and political concerns have regarded Rorty's ethnocentrism and epistemological behaviourism as viciously circular and conservative, making existing practices and institutions self-justifying and impervious to rational criticism, an objection also brought against other epistemological behaviourists such as Wittgenstein. Rorty's response has been to appeal to Kuhn and Davidson. According to Kuhn's account of scientific revolutions, relatively large-scale changes in the standards and practices of rhetorical communities are not justifiable by criteria available to those in the community before the change, but one result of the change is that new criteria become available to the reconstituted community after the revolution. Rational justification of the new beliefs and vocabulary, and rational criticism of the old beliefs and old vocabulary are available, but only when the new vocabulary and its attendant standards are established. According to Davidson's account of metaphor, metaphorical uses of old words to make new judgments that are false and even irrational by existing practices of justification, can change people's practices so that, as dead metaphors, the sentences are true and justified. Our accounts of the development of thought to its present (or future) achievements are always 'Whiggish'. The recognition that our most important values and practices are without foundation or non-question-begging justification is *ironism*.

4 Mind and society

As a social philosopher, Rorty advances two different lines of thought: on the one hand, he is a bourgeois liberal democrat celebrating 'the end of ideology' and advocating an incremental meliorism; on the other hand, he tries to keep the field open for, and even to cheer on, radically imaginative utopianism (for example, by feminists), however uncongenial to the stodginess of his first line of thought, provided it does not actually clash with either his liberalism or his anti-foundationalism. This has made him a target for political thinkers from all points on the political spectrum, who accuse him, even when he agrees with them, of giving comfort to the enemy.

In philosophy of mind, Rorty, following Ryle and Dennett, takes our talk of beliefs, desires and so on to be a way of talking which we find useful for predicting, controlling, imagining and making sense of some of the things that we and some other things do, just as physics and neurology give us ways of talking which are useful for predicting, and so on, other things that we and some other things do. No one of these is primary or needs to be reduced to the others, though we need not suppose that when we mention someone's beliefs and desires we are talking about something other than what we are talking about when we mention their neural processes (non-reductive physicalism). The mind as a philosophical subject Rorty takes to be a monstrous fiction cobbled together by Descartes out of thoughts and sensations; philosophers should drop talk of the mind, as it is confusing and unhelpful (eliminative physicalism).

Many strands in Rorty's thought have been neglected in the preceding sketch - his continuing skirmishes with philosophy as a profession, his ideas on the historiography of philosophy and his attacks on socialism, for example. Rorty has exhibited the virtues of modesty and willingness to learn from sympathetic criticism, and he has modified and extended his thought considerably throughout his career. He will undoubtedly have added new twists by the time you read this.

MICHAEL DAVID ROHR

List of works

Rorty's output runs to hundreds of articles and grows by a dozen or more items each year, often published in out-of-the-way places. A nearly complete list up to 1994 may be found in Saatkamp's 1995 work. I have listed his books and a few of the most influential or representative articles that have not, at the time of publication, yet appeared in his books.

Rorty, R. (1965) 'Mind-Body Identity, Privacy and Categories', *Review of Metaphysics* 19 (1): 24-54.(Much anthologized early defence of eliminative materialism with metaphilosophical corollaries.)

Rorty, R. (ed.) (1967) *The Linguistic Turn: Recent Essays in Philosophical Method*, Chicago, IL, and London: The University of Chicago Press, 2nd edn, 1992. (Anthology of metaphilosophical essays by ordinary language and ideal language analytic philosophers; long introduction by Rorty.)

Rorty, R. (1979) *Philosophy and the Mirror of Nature*, Princeton, NJ: Princeton University Press.(His major work; see §1 above.)

Rorty, R. (1982a) *Consequences of Pragmatism (Essays: 1972-1980)*, Minneapolis, MN: University of Minnesota Press.('Essays which might have some interest for readers outside of philosophy'.)

Rorty, R. (1982b) 'Contemporary Philosophy of Mind', *Synthese* 53 (2): 323-48. (Places his views in the context of views of contemporary analytic philosophers.)

Rorty, R. (1984) 'Diskussion/Discussion: A Reply to Six Critics', *Analyse & Kritik* 6: 78-98.(A good example of Rorty's responses to criticisms.)

Rorty, R. (1987) 'Thugs and theorists: A Reply to Bernstein', *Political Theory* 15 (4): 564-80.(Defence of Rorty's anti-Marxist social democratic liberalism.)

Rorty, R. (1989) *Contingency, Irony, and Solidarity*, Cambridge: Cambridge University Press.(Lectures on language, selfhood and politics plus interpretations of other writers.)

Rorty, R. (1991a) *Objectivity, Relativism, and Truth: Philosophical Papers*, vol. 1, Cambridge: Cambridge University Press. (Papers, 1980-89, dealing with issues and figures within analytic philosophy, especially Davidson.)

Rorty, R. (1991b) *Essays on Heidegger and Others: Philosophical Papers*, vol. 2, Cambridge: Cambridge University Press.(Papers, 1980-89, dealing with Heidegger, Derrida and Foucault.)

Rorty, R. (1993a) 'Feminism, ideology, and deconstruction: a pragmatist view', *Hypatia* 8 (Spring): 96-103.(What Rorty thinks pragmatism can contribute to feminism.)

Rorty, R. (1993b) 'Putnam and the relativist menace', *Journal of Philosophy* 90 (9): 443-61.(An attempt to settle some differences with Putnam.)

Rorty, R. (1994) 'Does Academic Freedom Have Philosophical Presuppositions?', *Academe* 80 (6): 52-63. (Consequences of anti-foundationalism for academic freedom.)

Rorty, R. (1996) 'Who are we? Moral Universalism and Economic Triage', *Diogenes* 44 (1): 5-15.(Consequences of ethnocentrism for the politics of rich and poor.)

Roscelin of Compiègne (c.1050-after 1120)

Roscelin of Compiègne was one of a group of logicians in late eleventh and early twelfth-century Europe who, in defiance of most of their predecessors in the field, treated logic as dealing with the concrete physical things that serve as verbal signs of realities rather than the realities those signs signified. This meant that although the things logic talks about are part of the physical world, it talks about them not as things referred to by language but as parts of language itself. All the technical notions of Aristotelian logic, for example 'universal', 'individual', 'category', 'genus' and 'species', apply only to those linguistic signs themselves qua *signs.*

Very little is known of Roscelin's life beyond the facts that he was born in Brittany around 1050, taught in France, was forced in 1092 to renounce certain positions he had taken on the doctrine of the Holy Trinity, and died after 1120. Of his work, only a letter to Peter Abelard is known to have survived. Consequently, what knowledge we have of his views comes to us second-hand, and in this case from the witness of two thinkers, Abelard and Anselm of Canterbury, known to be unsympathetic to his positions. Anselm tells us that Roscelin thought of universals, such as genera and species, as mere 'puffs of air', by which was meant the air expelled in uttering a word such as 'animal' or 'donkey' (see Universals). Also according to Anselm, Roscelin denied that qualities such as colours are anything over and above the subjects that possess them.

Roscelin's view of universals as concrete physical things used as verbal signs goes along with his apparent refusal to allow that anything could be common to many things independently of being a signifier of many. Abelard reports that Roscelin was 'insane' enough to draw from this view that wholes should not be thought of as divided into parts. This opposition to commonness is probably what led him to a form of tritheism in which there is no room for a divine essence that is genuinely common to all three divine Persons. He characterized the doctrine that the three Persons have but one substance as 'a manner of speaking', and such remarks were sufficient to bring down on him the charge of heresy.

What we know of Roscelin's views in logic entirely coincides with some positions adopted in a work entitled *Dialectica* dating from the mid or late eleventh century and ascribed to a certain 'Garland'. Professor L.M. de Rijk (1959) in his edition of this work has made a case for the work being by Garland 'the Computist', the author of an astronomical work called *Compotus*, probably a native of Lorraine and eventually a master at Besançon in 1084; but the authorship of the *Dialectica* is still very much in doubt. On the assumption that 'Garland' is the author's name, we can note that his overall approach to logic is probably very close to what Roscelin accepted. For example, when discussing the Aristotelian categories (see Categories), Garland equates a given category, such as substance, with the physical thing that serves as the category-word, for example, 'substance', plus all the words which are its species and individuals, such as 'body', 'human' and 'Socrates'. Any word 'signifies' the items it is true of, that is, those we would now say are in its extension. 'Animal', for example, signifies each and every animal. As for the intensional side of meaning, Garland speaks of 'modes of signifying' rather than anything signified. Thus both 'human' and 'wise' signify Socrates, but they do so in different modes. On this basis Garland draws the conclusion that of the category-words, that is, the ten highest genera serving to name the ten Aristotelian categories, each signifies everything, but in different modes. 'Substance', 'quantity', 'quality' and so on all signify the individual things named by the proper names in the category of substance; in other words, their extensions entirely coincide. It is very likely that something close to this was Roscelin's position as well. This relegation of the intensional side of signification to mere 'modes' removes from logic the temptation to posit real entities common to many individuals prior to any signification, the real universals we know Roscelin abhorred. Although Roscelin agreed that universals were things - that is, uttered puffs of air - their universality resulted from the use of those things as signs, and in that sense he was an anti-realist on the question of universals (see Realism and anti-realism).

This anti-realism doubtless had an effect on Roscelin's pupil, Peter Abelard, who in the early twelfth century conducted a sustained polemic against the various forms of realism which were current in his day. However, Abelard never credits his former teacher with having been right about anything, perhaps because he wished to distance himself as much as possible from a suspected heretic. Nevertheless, Roscelin's position that universals were only words and that commonness is a result, not a presupposition, of signification remained an important

option on this question throughout the medieval period, indeed throughout all subsequent philosophy in the West.

List of works

Of Roscelin's works, only a letter to Abelard is still extant; the text of this can be found in the appendix of F. Picavet *Roscelin philosophe et theologien d'après la légende et d'après l'histoire; sa place dans l'histoire generale et comparée des philosophies medievales*, Paris: Alcan, 1911. The further readings suggested for this entry offer further sources for Roscelin's thought.

Rosenzweig, Franz (1886-1929)

*An outstanding Hegel scholar - his Hegel und der Staat (Hegel and the State) (1920) remains a standard work on Hegel's political philosophy - Franz Rosenzweig elaborated, in Der Stern der Erlösung (The Star of Redemption) (1921) and several articles - notably, his 1925 article 'Das neue Denken' ('The New Thinking') - a philosophy of revelation that breaks with the systematic and rationalistic premises of German Idealism. The nisus of Rosenzweig's New Thinking was formulated as early as 1917, in a letter containing the germ (*Urzelle*) of Der Stern: 'after reason, ''philosophical reason'', has absorbed everything in itself', Rosenzweig writes, 'after it has proclaimed its sole existence, man suddenly discovers that he is still here, although he was digested long ago…. I am still here, I - plain, private subject, with first and last name, I - dust and ashes….* Individuum ineffabile triumphans*'. How can this be? The human being, Rosenzweig explains, can acquire personal identity as an individual only through the call, that is, the revelation of the Other: God - but also, some other human being. Dialogue, communication in language, comes to the fore in this philosophy, developed around the same time as Martin Buber's* Ich und Du (I and Thou) *(1923). Often treated as a common ground and basis for understanding between Jews and Christians, Der Stern der Erlösung is a major source of inspiration for such contemporary philosophers as Lévinas and is widely regarded as a masterpiece of Jewish philosophy.*

1 Life

Born in Cassel, Germany, Rosenzweig studied history (under Friedrich Meinecke) and philosophy (under Heinrich Rickert) at Freiburg and Berlin. His dissertation on Hegel's political philosophy became the first part of *Hegel und der Staat (Hegel and the State)* (1920). While in Berlin Rosenzweig discovered a manuscript in Hegel's hand, *Das älteste Systemprogramm des deutschen Idealismus (The Earliest Programmatic System of German Idealism)*, which he thought to be Hegel's copy of an original sent to Hegel by Schelling. The manuscript and Rosenzweig's analysis of it are still at the core of many discussions of German Idealism. But Rosenzweig himself turned in another direction. In July 1913, after intense discussions with friends and relatives who had converted from Judaism to Christianity, Rosenzweig resolved to become a convert himself. Determined to enter Christianity as a Jew and not 'a pagan', he attended the worship services of Rosh ha-Shanah and Yom Kippur and found there a spirituality he had not expected to find in his ancestral faith. Abandoning his planned conversion, he committed himself to the Jewish religious tradition. Drawing nearer to the Jewish Neo-Kantian philosopher Hermann Cohen, Rosenzweig wrote *Der Stern der Erlösung (The Star of Redemption)* (1921), most of it in the trenches during his years of military service in the First World War, completing the book in 1918. He settled in Frankfurt in 1920, where he founded the *Freies Jüdisches Lehrhaus* (Independent House of Judaic Studies). From 1922 until his death he battled with a severe illness which progressively paralysed him, but he continued to write on the New Thinking, Jewish thought, Jewish life in Germany, and the problems of translating the Hebrew Bible into German, a project which he undertook in collaboration with Martin Buber.

2 German Idealism

Rosenzweig's *Hegel und der Staat* shows the influence of his teacher, Meinecke. But it also breaks with Meinecke's widely influential reading of Hegel and evinces a pioneering independence of mind. In *Weltbürgertum und Nationalstaat (Cosmopolitanism and the National State)* (1907), Meinecke had made Hegel an early advocate of the Machtstaat, or power-state, a Machiavellian entity grounded in *Realpolitik* and exempt from all moral obligations towards the individual. In *Hegel und der Staat*, Rosenzweig breaks with this reading of Hegel's political philosophy. He offers a meticulously documented and still authoritative analysis of Hegel's intellectual development. Adopting a stance that has been enlarged and deepened but broadly confirmed by later research, Volume II interprets Hegel's mature idea of the state as a counter to both revolutionist and royalist/legitimist claims, owing much more to British parliamentary models than to prevailing Prussian traditions (see Hegel, G.W.F. §8).

Rosenzweig's reading of Hegel still holds to many of Meinecke's ideas (see Bienenstock 1992a). For example, it takes over Meinecke's definition of *Macht*, power, in terms of *Gewalt*, violence. Hegel in fact identified *Macht* with *Geist* (spirit). Rosenzweig notes that fact but never elucidates the true sense that Hegel gives the idea of Geist. Rather, he interprets Hegel's assertion of a link between the *Volksgeist* and the state in terms of a distinction

borrowed, once again, from Meinecke: between *Staatsnationen* and *Kulturnationen*; that is, nations, founded on the unifying force of a common political history and constitution, and those founded on some common cultural experience - linguistic, literary, or religious. To Rosenzweig it seemed clear that Hegel, who claimed that there can be no universal history without the state - that is, without a common *political* history - would have been able to account for the nation state but not for the *Kulturnation*, in which a common language or religion grounds a common history.

The idea of culture that Rosenzweig used here is again heavily indebted to Meinecke and tinged with a non-Hegelian, romantic conception of culture as the irrational source of a people's life. The manuscript that Rosenzweig had found in Berlin contains sharp criticism of the very idea of the state, this 'mechanical thing', and ends with a call for the foundation of a 'new mythology' among the people. It was because he saw these ideas as more in keeping with Schelling's project than with Hegel's that Rosenzweig ascribed the work to Schelling, but he felt deep affinities with the Programme. In a letter to his mother (3 July 1918) he remarks with approbation that the Jewish people is now 'the only people with a national myth' - and, for this reason, the only people beyond the state and beyond history. The remark sheds light on Rosenzweig's attitude toward German idealism in the *Der Stern der Erlösung*. Reacting there against Hegel's logocentrism, Rosenzweig draws upon Schelling's late, 'positive' philosophy. It was Schelling's *Philosophie der Offenbarung (Philosophy of Revelation)* (1856-8) and *Die Weltalter (The Ages of the World)* (1811-15) (read by Rosenzweig in the 1913 version) that helped him find his way back to a Jewish reading of the Bible.

3 The New Thinking

Rosenzweig's New Thinking originates in his rejection of Hegel's philosophy, which he sees as the climax of the philosophical enterprise at large, 'from Ionia to Jena'. This tradition, which endeavours to grasp the All, Rosenzweig argues, always reduces reality, in the end, to a single element, whether world (in ancient Greek philosophy), God (in the medieval period), or human spirit (in the modern). The New Thinking sets in with a broken totality. It speaks for the irreducibility of each element: God, world, the human being. Drawing on Kierkegaard, but also on Schopenhauer and Nietzsche, Rosenzweig writes at the very beginning of *Der Stern* that when I, as a human being, am confronted with death, my own personal death, I experience the impossibility of reducing it to nought (*Nichts*), and the corresponding impossibility of reducing the world to some rationally comprehensible 'being' (see Kierkegaard, S.A.).

Being, Rosenzweig insists, is not identical with thought or, for that matter, with God conceived as *logos*. Setting himself against the opening verse of John's Gospel, 'In the beginning was the Word', he contends that the Word (*logos*) comes second: 'The beginning is: *God Created*'. Here Rosenzweig returns not just to Genesis but to one of the great issues tackled in Jena around 1800 by Hölderlin, the young Schelling and Hegel: the problem of the nexus of myth and language. To ascribe the creation of all things to the Word, he argues, confines us to myth, to a world produced by a 'creative' activity like that of the poet or artist. Such an activity, he insists, involves no real language. For, instead of using words as symbols denoting things and thus different from those things, it presumes the identity of words with things; that is, it relies upon myth. To account for language, one must break with myth and so with the logos-philosophy grounded on the identification of word and thing, thought and being. For Rosenzweig this requires us to acknowledge the reality of Creation, and the main part of *Der Stern* - its 'heart' in Rosenzweig's words (Book II) - thus begins with Creation. Here Rosenzweig describes Creation - like Schelling in the *Philosophie der Offenbarung* - as a 'birth from the ground' (*Geburt aus dem Grunde*), manifesting itself through the 'alternation' (*Wechsel*) of two 'primal Words' (*Urworte*), irreducible to one another: Yes and No, 'Being' (*Sein*) and 'Nought' (*Nichts*), one principle through which God's 'essence' will assert itself, and another through which it will negate or restrain itself.

These Words, Rosenzweig insists, constitute no real language. The close affinity some have seen in Rosenzweig's conception of a *creatio ex nihilo* (*Schöpfung aus Nichts*) to Kabbalistic ideas is open to question (see Scholem 1930; Idel 1988). But its conceptual roots in Schelling should not be overlooked. Like Schelling, Rosenzweig aims at exposing the failure of any kind of idealistic dialectic that would arrogate to itself the power of explaining Creation - the emanationist doctrines elaborated in the Middle Ages and their culmination in the more recent, idealistic attempts of philosophers to produce the Many from the One. Against Hegel's 'pantheism', Rosenzweig builds upon Schelling's understanding of the relationship between myth and language and argues in

Der Stern that myth, which is typical of paganism, remains alive in us all. To a mythical consciousness, he writes, the world appears endowed with life, animated by forces perceived as both natural and divine. Such a consciousness resists distinctions between nature and culture, but also between past and present. To it, past events are still here, still living, permanently present in consciousness (see Schelling, F.W.J.).

For consciousness to distinguish between past, present and future, it must break loose from the mythical world in which it first lives. This, Rosenzweig claims, is what Revelation achieves. It replaces the mythic past, in which neither past nor present exist, with a past comprehended as such, thus making possible both a present and a future. Here Rosenzweig draws on the opening sentences of Schelling's *Weltalter*: 'the past is known (*gewußt*), the present is understood (*erkannt*), the future is foreseen (*geahndet*). That which is known is narrated (*erzählt*), that which is understood is described (*dargestellt*), that which is foreseen is prophesied (*geweissagt*)'. Building on these distinctions, Rosenzweig makes the past the age of Creation, the present the age of Revelation, and the future the age of Redemption (the three parts of the 'heart' of *Der Stern*). Creation is *narrated*, in the Bible; the present is *described*, and Redemption is *prophesied*.

In *'Das neue Denken' ('The New Thinking')* (1925), Rosenzweig urges that the human experience of past, present and future, is existential; it grows out of the inner life of consciousness; and its temporality, therefore, cannot be erased by thought. Thus the error of all philosophical systems in which thought is made timeless. Rosenzweig's insistence on temporality (*Zeitlichkeit*) anticipates Heidegger's *Sein und Zeit (Being and Time)* (published six years after *Der Stern*; see Löwith 1942). But where Heidegger acknowledges only 'existential' (temporal) truths, Rosenzweig discovers a truth beyond time, eternal, revealed truth. Revelation, he argues in *Der Stern*, enables us to apprehend Creation as an event belonging to the past, but is not itself an event in the past. Rather, revelation takes the form of a command issued to us in the present: the command to love God and, through God, our fellow human beings. To explain why this command dawns upon us as a revelation, Rosenzweig goes back beyond the Revelation at Mount Sinai, to God's call to Adam in Genesis (1: 9): 'Where are you?'. God's original Revelation occurs through this call. For Revelation is made to all human beings, not only to Israelites; and it dawns upon us from the outside. It is the revelation of a 'Thou', of an Other issuing a command. There is at first no 'I' to answer. Adam does not answer God's call. He tries to escape his responsibility - to evade the summons made to him personally, to him as an individual, who has a 'private name' - by hiding behind a pronoun: 'it', 'she' or 'he' (did it). An answer to God's call becomes audible in Abraham's 'Here am I' (Genesis 22: 1) - then, louder, in Israel's acceptance, renewed each day, of God's command. Only so does the revelation of a 'Thou' issue in a true dialogue with an 'I'.

Rosenzweig elaborates here, almost simultaneously with the Catholic teacher Ferdinand Ebner in *Das Wort und die geistigen Realitäten (The Word and the Spiritual Realities)* (1921) and with Martin Buber in *Ich und Du* (1923), what may be considered the first systematic presentation of the philosophy of dialogue (see Buber, M.). Rosenzweig, who knew both works, also criticized them. According to him, both Ebner and Buber so narrowed the 'I-Thou' relation that they lost sight of the 'We' and of nature.

Rosenzweig himself drew on the work of his friend Eugen Rosenstock-Huessy, a historian and sociologist of Jewish origin who had converted to Christianity and who was then teaching at the University of Leipzig. In his *Angewandte Seelenkunde (Practical Knowledge of the Soul)* (1924), a text Rosenstock-Huessy sent to Rosenzweig as early as 1916, the former had argued that the Cartesian *cogito ergo sum* should be replaced with a so-called 'grammatical' proposition: 'God called me, therefore I am. I am given a private name, therefore I exist'. He had made the human being 'a being that is spoken to' (*ein angeredtes Wesen*). He had sought to establish on this basis a true 'science of the soul' (*Seelenkunde*), a discipline that would do justice to the soul, instead of just giving up the word, as William James had done in his *Psychology*. According to Rosenstock, those who reduce the science of the soul to a 'science of the mind' (*Geisteswissenschaft*), turn language to logic and cannot understand what a 'community' (*Gemeinschaft*) is. They reduce it either to a mere collection of individuals moved by private interests, or to an entity understandable only as an 'it'. Such reductions are politically dangerous.

Rosenzweig fully agreed with his friend's diagnosis. He saw in the Jewish people a true community in Rosenstock's sense. Making much use of the Song of Songs, where 'strong as death is love' (8: 6), he contends in *Der Stern* that the dialogue of the 'lover' (God) with the 'beloved' (Israel) announces a Redemption already lived by the Jewish people in the present, although it is pregnant with the future. The eternal people are 'beyond

history' - always and already 'with God'. In this sense, Israel is the true incarnation of Eternity in time. Other peoples, particularly Christian ones, are 'on the way to God', that is, invested with the responsibility to realize the divine mission in history.

In keeping with this model, Rosenzweig opposed Zionism, thinking that Judaism can be lived only in Exile, at least as long as the history of the peoples of the earth has not ended. This conviction of his, much criticized for its seeming acceptance of the notion and the myth of the Wandering Jew, may also be seen as a variant of Hegel's idea that eternity itself is in time. Despite all his criticism of German Idealism, Rosenzweig remained enmeshed in it.

Rosmini-Serbati, Antonio (1797-1855)

In the reactionary, anti-Enlightenment, spiritualistic climate of Italy and Europe in the first decades of the nineteenth century, the Italian philosopher Rosmini set out to elaborate a Christian, Catholic system of philosophy which drew elements from Platonic, Augustinian and Thomist thought, while also taking account of recent philosophical developments, especially Kantian ones, as well as of the new liberal political trends in the culture of the time. His aim was to restore the principle of objectivity in the field of gnoseology, as well as in ethics, law and political thought.

Rosmini studied at Padua and was ordained in 1821. In 1826 he settled in Milan and two years later founded a religious congregation, the Istituto della Carità (Institute of Charity). In 1830 he published his first and most important philosophical work, the *Nuovo saggio sull'origine delle idee (New Essay on the Origins of Ideas)*, in which he distanced himself from empiricism and sensism, on the one hand, and idealism and rationalism, on the other. Empiricism and sensism, for Rosmini, offer less than what is needed, in that they attempt to derive knowledge and spirituality exclusively from experience. Idealism and rationalism, by contrast, offer more than is necessary, claiming, as Kant did, the innateness of all ideas as formal elements of knowledge. Both positions are characterized by subjectivism and thus lead to scepticism.

To get beyond subjectivism and scepticism, Rosmini argues, it is necessary to proceed from the proposition that the human intellect contains an original, essential idea, which does not derive from experience but is innate and thus imprinted by God, and which can be sensed through intuition. This idea is the idea of being in general: of indeterminate, possible being, in the sense that it can take on any determination and that it is the presupposition of all ideas and all judgments. It is this idea of being, this light of reason, that guarantees the objectivity of knowledge. This owes a great deal to the doctrines of Plato, Augustine and Aquinas, especially where the elements of 'innatism' and the illumination of reason are concerned. In the part of his system that deals with the processes of knowledge, however,Rosmini accepts certain fundamental aspects ofKant's critical philosophy.

One notion he derives from Kant is the distinction between material and formal elements and the need for a synthesis between them in the act of knowing (which, forRosmini, as for Kant, is essentially the act of judging) (see Kant, I. §6). He departs sharply from Kantian tradition, however, regarding Kant's a priori synthesis - what Rosmini calls '*percezione intellettiva*' ('intellective perception'). For Rosmini, the formal element is represented not by a mere transcendental category, but by the idea of being. Although this idea guarantees the objective validity of knowledge, it is not sufficient in itself to form the basis for determinate knowledge, to allow us to apprehend the reality of things. A direct encounter between the intellect and the sensible world is needed. This 'intellective perception' is the product of the synthesis between form, given by the idea of being and intuited by the intellect, and matter, which derives from sensations and from the '*sentimento fondamentale*': the underlying sense that all human beings have of their own life in its entirety and of which sensations are merely modifications.

The above notion of being or ideal being was particularly central to Rosmini's thought, supplying a philosophical foundation for his reconstruction of a spiritualistic metaphysics in his posthumously published *Teosofia (Theosophy)* (1859-74). In particular, it provided a grounding for the essential principle of that metaphysics, the existence of God. ForRosmini, ideal being is in fact merely one divine element of a personal Being, God. Ideal being thus postulates the real and absolute Being of God. In addition, Rosmini sees general ideas, such as identity, non-contradiction, and substance and cause, as deriving from the same notion of being through a process of abstraction and universalization. In this way, he constructs a comprehensive philosophical system, spanning the 'ideological' sciences, whose object is ideal being; the metaphysical sciences; and the deontological sciences, which concern themselves with ethics, law and politics.

In ethics, as in metaphysics, with such works as *Antropologia in servizio della scienza morale (Anthropology at the Service of Ethics)* (1838), Rosmini aims to restore the principle of objectivity, which he regards as having been abandoned in favour of subjectivism by both utilitarians and hedonists and by Kant. From the notion of being, which for him was the premise of gnoseological truth, there also stemmed the notion of the Good, which is the end of morality and the object towards which our love should be directed, according to a scale of values that has God at its summit, but which also has a place for persons, who have the status of ends in themselves, as they do in Kant.

The Good, which translates into moral law, not only can be known by the intellect, but should also be pursued by the will. The achievement of this objective can be impeded by the senses and by our instincts, as well as by individuals' free choice.

Rosmini's contributions to jurisprudence and political philosophy are closely bound up with his moral thought. It is moral law, in fact, which justifies personal rights - the ends to which society and state are the means. Civil society should under all circumstances adhere to the model provided by ecclesiastical society, which aims at a happiness lying beyond this world. In other words, it should look to the Church, which Rosmini considered was in need of reform, as he argues in his *Delle cinque piaghe della santa Chiesa (The Five Wounds of the Holy Church)* (1848a). From 1836, Rosmini lived in Piedmont, where, under the influence of liberal trends in political thought, he underwent an intellectual evolution that took him as far as a moderate constitutionalism and support for the notion of a federation of Italian states against Austria, expressed in his *Costituzione secondo la giustizia sociale (The Constitution According to Principles of Social Justice)* (1848b).

Rosmini was accused of psychologism (that is, subjectivism) by Vincenzo Gioberti, and he came under attack from Catholic critics (in 1888, the *Congregazione del Saint'Uffizio* condemned forty propositions drawn from his works). Idealists, however, considered him an Italian and Catholic version of Kant, and a point of transition to Neapolitan neo-Hegelianism. His attempt at a modern synthesis of Catholic philosophy has influenced modern Christian spiritualism.

List of works

Rosmini-Serbati, A. (1934-) *Opere edite e inedite di Antonio Rosmini (Complete Works)*, ed. E. Castelli and M.F. Sciacca.(The National Edition of Rosmini's works is published with the collaboration of the Istituto di studi filosofici, Rome and the Centro di studi rosminiani, Stresa.)

Rosmini-Serbati, A. (1830) *Nuovo saggio sull'origine delle idee (New Essay On The Origin Of Ideas)*, ed. F. Orestano, Rome: Anonima Romana Editoriale, 1934.(Rosmini's central work, this forms the basis for his entire theoretic, metaphysical, moral and legal-political system of philosophy. Vols 3-4 of the *Complete Works*.)

Rosmini-Serbati, A. (1831, 1837) *Principi della scienza morale e storia comparativa e critica dei sistemi intorno al principio della morale (Principles of Ethics, with a Comparative Critical History of Systems Concerned with the Principle of Morality)*, ed. D. Morando, Milan: Fratelli Bocca, 1941; trans. D. Cleary and T. Watson, *Principles of Ethics*, Durham, Rosmini House, 2nd edn, 1989.(The first work in which Rosmini uses the foundations laid by the philosopher di Rovereto to re-establish, on an objective basis, a universally valid moral science. Vol. 21 of the *Complete Works*.)

Rosmini-Serbati, A. (1838) *Antropologia in servizio della scienza morale (Anthropology at the Service of Ethics)*, ed. C. Riva, Roma and Milan: Fratelli Bocca, 1954.(Complements and enlarges on his principles of moral science. Vol. 25 of the *Complete Works*.)

Rosmini-Serbati, A. (1841-5) *Filosofia del diritto*, ed. R. Orecchia, Rome: Città nuova, 1967-8, 2 vols; vol. 1, trans. D. Cleary and T. Watson, *The Philosophy of Right*, Durham, Rosmini House, 1993.(In this work Rosmini illustrates the essential human rights - rights to truth and justice, rights regarding ones body and life, and property rights - which cannot be postponed, even for the sake of public welfare. Vols 35 and 36 of the *Complete Works*.)

Rosmini-Serbati, A. (1848a) *Delle cinque piaghe della Santa Chiesa (The Five Wounds of the Holy Church)*, ed. A. Valle, Rome: Città nuova, 1981.(In perhaps his best-known work, Rosmini illustrates what he perceived as the worst evils of the Church at the time and proposes remedies, from a liberal-catholic viewpoint.)

Rosmini-Serbati, A. (1848b) *Progetti di Costituzione. La Costituzione secondo la giustizia sociale (Constitutional Projects. The Constitution According to Principles of Social Justice)*, ed. C. Gray, Milan: Fratelli Bocca, 1952. (These reflect the constitutional phase of Rosmini's political thought, in which he forces himself to accept as fully as possible, with limitations of a confessional catholic nature, the aspirations of the moderate liberal movement. Vol. 24 of the *Complete Works*.)

Rosmini-Serbati, A. (1859-74) *Teosofia (Theosophy)*, ed. C. Gray, Rome: Edizioni Rome and Milan, Fratelli Bocca, 1938-9, 1940-1.(A posthumous work in which Rosmini brings out the first and most important consequence of the construction of his philosophical system, namely the restoration of a spiritualistic

metaphysics. Vols 7-14 of the *Complete Works*.)

Ross, Alf (1899-1979)

Famous for his contribution to Scandinavian legal realism, Alf Niels Christian Ross was among the major philosophers of the latter half of the twentieth century. He was Kelsen's ideal successor and on a par with H.L.A. Hart in terms of notoriety and international influence.

Ross opposed equally natural law theories and formalistic legal positivism and, following Hans Kelsen whose Vienna seminars he attended in 1924-5, he insisted that the central questions of law were epistemological (what is law? what is legal knowledge?) yet rejected the 'two-world' dichotomy of *Sein* and *Sollen* ('is' and 'ought') with their separate methods of investigation. The rejection of dualism and dilemmas on how to characterize the interplay of law's normative and factual character condition his entire life's work (see Legal positivism §5; Natural law).

Under the influence of Axel Hägerström (§4) Ross found the philosophical basis on which to ground his need for realism. Ross embraced the theory that a concept of reality is not logically conceivable outside the context of space and time, the emotivistic concept of values and the noncognitive notion of value judgments, and the rejection of voluntarism as a theory of positive law. Ross claimed that 'legal phenomena' rather than 'positive law' must be investigated. These comprise mental impulses and attitudes of impartial behaviour, rationalized in the use of normative and evaluative linguistic expressions (validity), as well as attitudes of biased behaviour, construed as the subjectivization of coercion. Although formally distinguishing them, Ross equates legal and moral validity, both understood as psychological phenomena of rationalization. Naturally he now abandoned his previous view that specific normative knowledge is possible. Legal science, including legal dogmatics, was to be subsumed in the wider sphere of psychological and sociological sciences which study human behaviour. Yet the concern did not abandon the need to explain at least the feeling of obligation, being bound by law.

In the final and most famous phase of his work, Ross turned to logical positivism. In the preface to the English edition of *On Law and Justice*, Ross coupled Anglo-American jurisprudence from John Austin to Oliver Wendell Holmes with the Scandinavian tradition from Anders Sandoe Orsted to Hägerström. Ross declared that his aim was to trace empiricist principles to their ultimate conclusions in the field of law. The principle of verifiability provided the means to do this: any statement has a meaning in so far as it implies that, following certain procedures, certain results can be obtained, the set of results representing the 'real content' of the statement. Hence legal statements of the type 'Directive D is a valid law' signifies that 'by applying the system of norms as a scheme of interpretation, we are enabled to comprehend the actions of the courts as meaningful responses to given conditions' (Ross 1958: 39). The procedure of verifying such propositions will be the behaviour of the courts which settle legal disputes (see Meaning and verification).

In *Directives and Norms* (1968) Ross adopts and modifies R.M. Hare's distinction between phrastic and neustic in order to ascribe to norms a semantic meaning denied earlier. Legal dogmatics none the less remains an empirical science, no longer a branch of sociology since this discipline is concerned with law in action while legal dogmatics studies the abstract ideal content of legal norms. Now too the biased and impartial attitudes are separated out, no longer construed as part of the reality of law, but rather, part of the phenomenon of reasons that induce people to obey the law.

Ross, William David (1877-1971)

W.D. Ross was a British ancient and moral philosopher. In terms of his moral thinking, he was a pluralist, who held that there are several distinct moral considerations which bear on the rightness of an action. Among the things we need to take into account are promises we have made, the need to avoid harming others, gratitude to benefactors, and the amount of good our action will produce. That these considerations are morally relevant is something we can know, but which action is the right one is a matter of fallible judgment, because that will depend upon how these considerations are to be weighed against each other in the particular case. Ross' contributions to the study of ancient philosophy mainly concerned Aristotle. He is now best known, however, for his moral philosophy.

W.D. Ross was a Fellow of Merton College, Oxford, before moving to Oriel College, where he became Provost. He was knighted in 1938. Ross made contributions to the study of ancient philosophy and in particular Aristotle, though he also published a book on the Platonic Forms (1951). He edited the Oxford Translation of Aristotle, wrote an influential book on Aristotle, and published several important editions of Aristotelian texts, with commentaries. Now, though, he is best known for his moral philosophy.

In his two major ethical works, *The Right and the Good* (1930) and *The Foundations of Ethics* (1939), Ross offers the clearest and most ably defended account of a pluralist deontology in the twentieth century (see Deontological ethics; Moral pluralism). One of Ross' main targets is the consequentialism of G.E. Moore (1903), which held that, in determining whether an action is right, there is just one consideration that is relevant, namely the amount of good that will result from doing that action (see Consequentialism; Moore, G.E.). Ross held, by contrast, that a number of features of actions are morally significant, and that which action is right will depend on which of these features carries the most weight in a particular case.

Deontology thus distinguishes itself from consequentialism in claiming that the right is independent of the good (see Right and good); the right action is not necessarily the one that produces the most good. Ross defends this claim by arguing that being productive of the most good is neither what it *is* for an action to be right, nor what *makes* an action right. The right action is also distinct from the morally good action; the latter depends on the agent's motives, whereas the former does not. His method throughout is to appeal to our ordinary reflective consciousness, which for Ross is the final arbiter on all ethical issues. He is confident that reflection on attempts to define 'right' will reveal that it is an irreducible notion. It cannot be analysed, but it can be elucidated: Ross suggests that rightness is a species of the relational property of fittingness or suitability. Just as a telling word or phrase may be called for at a particular juncture in a poem, so a particular moral response may be called for by various features of a situation, and the right action will be the act which constitutes the most suitable response to all the factors in that situation, taken as a whole.

Which features of an action are relevant to its rightness? Ross offers a list of what he terms '*prima facie* duties', each of which may have a bearing on the rightness of an action. These are duties of fidelity (promise-keeping), reparation, gratitude, justice, beneficence, self-improvement and nonmaleficence (not injuring others). Ross thus agrees with the consequentialist that we have a duty to do as much good as possible (beneficence) but he maintains that this is merely one duty among several, and one or more of the others might outweigh the duty of beneficence on some particular occasion (see Help and beneficence).

Despite having passed into common philosophical parlance, the phrase '*prima facie* duty' is, as Ross is quick to point out, doubly misleading. First, this is not strictly a list of duties, of things I ought to do, since, for example, it may precisely be my duty not to act in the way which will do the most good if I have promised to do something else. In here allowing considerations of fidelity to override those of beneficence I am not failing to carry out any sort of duty. Second, the term '*prima facie*' might suggest that we are speaking only of an appearance which a moral situation presents at first sight and which might turn out to be illusory. But even where some morally significant consideration is overridden by others, it does not cease to be relevant. (For this reason, some writers now prefer to use the term '*pro tanto*' duty.) It is perhaps best to think of Ross' list of *prima facie* duties as a list of fundamental moral considerations, or right-making characteristics, which always count in favour of an action (see Duty §2).

Ross' list is not an arbitrary one. He offers it as a list of the most basic morally relevant features. He does not claim that it is final - he is perfectly prepared to consider the possibility, for example, that one of the general features on the list might turn out not to be basic, or to be genuinely distinct from the others - but he does hold that what should be on the list is a subject for reasoned debate, drawing again on careful reflection on our moral beliefs.

That certain features of actions are right-making features is self-evident, according to Ross, in much the way that a mathematical axiom or the validity of a form of inference is self-evident. It is not that they are immediately obvious, but that, since they are basic, we cannot appeal to anything more fundamental to justify them. What we ought to do in any particular case is, by contrast, something of which we can never be certain, according to Ross, but only have a better or worse founded opinion. This pessimism about the possibility of moral knowledge in the particular case is perhaps over-stated, but it rests on a structural difference between knowledge of a general moral principle and appreciation of the particular case. Ross holds that, in all but the most trivial cases, whether an action is right will depend on the way that conflicting moral considerations bear on the particular case. There is no mechanical method, no algorithm, for calculating which of these considerations is the weightiest in some specific case. In most cases, there will be just one action that is the right one, but deciding which that is calls for judgment and practical wisdom (see Moral judgment §4).

Rousseau, Jean-Jacques (1712-78)

Rousseau was born in Geneva, the second son of Isaac Rousseau, watchmaker. His mother died a few days after his birth. From this obscure beginning he rose to become one of the best known intellectual figures of the eighteenth-century French Enlightenment, taking his place alongside Diderot, Voltaire and others as one of the emblematic figures of this period, for all that he came to differ violently in view from them. He died in 1778 and in 1794 his body was transferred to the Panthéon *in Paris.*

Rousseau always maintained that he regretted taking up a career of letters. His first love was music and he composed a number of operas in the 1740s with some success. The turning point in his life occurred in July 1749. He was on his way to see his then friend Diderot who was imprisoned at Vincennes. He read in the newspaper a prize essay question, asking whether advances in the sciences and arts had improved morals. So overcome was he by the flood of ideas that this question aroused in him the realization that he had to break his journey. The rest of his life's work was, he claimed, determined for him at that moment. Rousseau's primary claim to fame depends on his ideas about morals, politics and society. Perhaps his best-known remark is 'Man is born free; and everywhere he is in chains'; this reveals his preoccupation with issues of freedom in the state.

In answer to the prize essay question Rousseau argued that men and morals were corrupted and debilitated by advances in higher learning. The goal of prestigious distinction is substituted for that of doing useful work for the good of all. This theme, of people seeking invidious ascendancy by doing others down - the effect of exacerbated amour-propre *- pervades Rousseau's social theorizing generally. His essay,* Discourse on the Sciences and Arts *(1750), won the prize; related concerns shape the more profound* Discourse on the Origin of Inequality *of 1755. In his most famous work of political theory,* The Social Contract *(1762), Rousseau presents an alternative approach to how we might achieve a just and legitimate civil order. All members of society should take an equal place as members of the sovereign authority and societal laws should come from the general will by which a people gives rules to itself. Only under such a system, Rousseau argues, will humankind live on equal terms bound by fraternal ties, enjoying as much freedom and rights of self-determination as is possible in a stable community. Speaking up in this way for the equal political standing of all, regardless of birth or wealth, Rousseau points the way towards the dissolution of the* ancien régime *and the emergence of more democratically based polities. Precisely what influence his ideas had on the French Revolution is impossible to determine, although his name was often invoked.*

Rousseau also wrote extensively on education. In his Émile *(subtitled* On Education*, 1762) he tries to show how a child could be brought up free of the aggressive desire to dominate others. Instead that child can be caused to want to cooperate with others on a footing of mutual respect. He hopes by this to show that his social proposals are not an unrealizable dream. In this work there are also criticisms of religious dogma and church practices which brought severe condemnation onto Rousseau. He had to flee Paris in 1762 to avoid imprisonment. This, and other related experiences, plunged him into a protracted period of mental distress in which he feared he was the object of the plotting of others. These others came to include David Hume, with whom Rousseau had hoped to find refuge in England in 1766.*

Still troubled in mind, Rousseau returned to France the next year, and during the last decade of his life he wrote several works of self-explanation and self-justification. The greatest of these is his autobiography, Confessions *(written between 1764 and 1775, published posthumously), but there are other more prolix writings. After an accident in 1776, the worst of Rousseau's mental disturbance seems to have cleared and his last substantive work, an album of miscellaneous reflections on his life, ideas and experiences (*Reveries of the Solitary Walker*, written 1776-8), has a clarity and balance which had been absent for so long.*

1 Life and writings

Brought up by his father for the first ten years of his life after the death of his mother, Rousseau traced his love of republican Rome to the reading of Plutarch that he and his father used to do. This love, along with the idolization of his native Geneva, provided the inspiration for many of his political ideas. After being involved in a fight, Rousseau's father fled Geneva in 1722 and Rousseau was sent to live with his cousin not far from Geneva for a couple of years. This period in his youth is exquisitely evoked by Rousseau in Book One of *Confessions* (1764-75). When he returned to Geneva his more lowly social station became apparent and he was indentured to

an engraver, Abel Ducommun, a brutal and ill-educated man.

Restless and dissatisfied, Rousseau was more than glad to take advantage of the mischance of being locked out of the city on a Sunday in 1728. He walked away from that life, seeking the help of a Catholic priest who sent him to see Françoise-Louise de la Tour, Baronne de Warens, who was in receipt of money to secure more Catholic converts. She sent him, in turn, to Turin for instruction and Rousseau was admitted to the Church in April 1728. It is doubtful that Rousseau had any deep spiritual involvement in this process; he was more anxious to retain others' interest in him. He had a number of shortlived jobs in Turin. In one of these, he lied about stealing a ribbon and put the blame on a servant girl. This wicked deed preyed on his mind for the rest of his life.

The next year, he made his way back to Madame de Warens. He learned the rudiments of music and his passion for music was a dominant force in his life at this time. By the Autumn of 1731 he had moved in permanently with Madame de Warens. They lived a life of innocent delight for some years, she calling him *petit* and he calling her *maman*. He became her lover in 1733, although he appears never to have enjoyed this almost incestuous relationship. He read avidly during this time, laying a foundation for many of his later writings.

This idyll did not endure, however. Rousseau was displaced in Madame de Warens's affections in 1738. Considerably aggrieved, he took up the post of tutor to the two sons of Jean Bonnot de Mably in Lyons in 1740. Not an adept teacher, he gave up the post after a year determined to make his way in the larger world of Paris where he moved in 1742 (two short essays on education date from this time).

Once there, he presented a paper on musical notation to the Academy of Sciences; this was published in 1743 as *Dissertation on Modern Music*. In that year, Rousseau went to Venice as secretary to the French Ambassador. They quarrelled and Rousseau returned to Paris to resume his musical compositions. About this time he set up home with his mistress, Thérèse Levasseur, who was to be his lifelong companion. He had a number of children by her, whom he abandoned to his later shame. Rousseau had also begun to keep the company of the rising Parisian intelligensia. Diderot was a personal friend and it was while on the way to visit him during one of his periodic bouts of imprisonment that Rousseau had the experience that fixed the course of the rest of his life. The Academy at Dijon had advertised a prize essay question asking whether the advancements in the sciences and arts had improved morals. Rousseau saw this and was so overwhelmed by a flood of insights evoked by it that (he said) he spent the rest of his life trying to put into words what he had seen in one hour. Rousseau, answering the question with a firm 'No', won the prize and his essay was published in 1750 under the title *Discourse on the Sciences and Arts*. He was poised to begin a new career as social critic, moralist and philosopher, but his last triumphs as a composer and musical theoretician also occur about this time. His opera *Le Devin du Village* was performed before the King at Fontainebleau in 1752 and his *Letter on French Music* (1753) created an enormous stir as part of a large-scale argument over the relative merits of the French and Italian styles.

Rousseau was soon to turn his back on Parisian society. He wrote a further, very original, essay on social questions, *Discourse on the Origin of Inequality* (1755) but then withdrew to the countryside the better to meditate and write about his new concerns, attracting the scorn of many of his erstwhile friends. Around this time he returned to the protestant faith of his childhood, and reclaimed his citizenship of Geneva. The *Discourse on the Origin of Inequality* has a passionate dedication to Geneva.

During the next six years, Rousseau wrote the bulk of his greatest work: his masterpiece of educational theory, *Émile* (1762); of political theory, *The Social Contract* (1762); but also a best-selling novel, *La Nouvelle Héloïse* (1761) and a host of smaller pieces: the *Letter to M. d'Alembert on the Theatre* (1758); the *Letter to Voltaire on Providence* (1756), the *Moral Letters* (1757-8), written to Sophie d'Houdetot with whom Rousseau was then desperately in love.

Catastrophe befell Rousseau in 1762 after the publication of *Émile*. A section of it, the so-called *Creed of a Savoyard Vicar*, was judged unacceptable by the religious authorities and out of fear of being imprisoned Rousseau fled Paris in June 1762. Unsettled years followed, mostly spent in different parts of Switzerland. Rousseau wrote extensively in defence of himself and his work during this time, including his *Letter to Christophe de Beaumont, Archbishop of Paris* (1763) written in reply to the condemnation of the *Creed of a Savoyard Vicar*; and his *Lettres Écrites de la Montagne (Letters Written from the Mountain)* (1764), a response to criticism of him made by Geneva's attorney-general. From January 1766 Rousseau spent just over a year in England at the

invitation and in the company of David Hume. Rousseau, almost always a touchy and suspicious person, was at that time in the grip of a severe paranoiac breakdown and he became convinced Hume was plotting to humiliate him. An account of this sorry episode was given by Hume (*A Concise Account*, 1766). Exhausted and ill, Rousseau returned to France in early 1767 and sought refuge well away from the public gaze near Grenoble where he married Thérèse.

The tide of public opinion was slowly turning, and in 1770 he returned to Paris very much a celebrated figure and object of curiosity, even though he was banned from writing and speaking on controversial matters. Despite his grave mental distress, Rousseau had, from around 1764, been working on his great autobiography, *Confessions*. He completed part one by 1770. He gave some private readings of parts of the text; these also were banned. Other personal works occupied the bulk of the last decade of his life. There is an extensive essay in self-justification and defence, *Rousseau Judge of Jean-Jacques: Dialogues* (1772-6). Its completion was marked by another episode of desperate mental anguish as Rousseau attempted to place the manuscript on the altar at Nôtre Dame. Later in 1776, returning home from a walk, Rousseau was knocked down by a dog. This accident seems, miraculously, to have cleared his mind and his last work, *Reveries of the Solitary Walker* (1776-8) has a simplicity and clarity of manner missing from the writings of the preceding years.

Not all his work was in self-vindication however. He wrote at length on the political problems of Poland (*Considerations on the Government of Poland* (1769-70); he prepared a *Dictionary of Music* (1767) and he botanized extensively, also writing some short works on botany (*Elementary Letters on Botany and Dictionary of Botanical Terms*, uncompleted). He died at Ermenonville in June 1778, outlived by Thérèse for twenty-two years.

It is useful to give more information about Rousseau's life than is usual for most philosophers or political theorists, since so much of his work arises from events in his life or is directly about himself. This is, however, not so true of his principal works of social and political theory, just because they are works more purely of theory. They provide the most solid basis for Rousseau's reputation, and an account of these follows.

2 Works leading up to *The Social Contract*

From 1750 onwards, Rousseau developed increasingly deeper and more sophisticated ideas about the origin and nature of the condition of man in society and about what could and should be done to ameliorate that condition. His discussion of these themes in his first serious work, *Discourse on the Sciences and Arts*, is fairly shallow. He argues that increasing scientific knowledge and refinement of arts and letters does not at all produce an improvement of morals either in individuals or in society at large. On the contrary, such sophistication is the offshoot of luxury and idleness and it has developed principally to feed people's vanity and desire for ostentatious and aggressive self-display. All these features work against the moral virtues of loyalty to one's country, courage in its defence and dedication to useful callings. Rousseau allows for the fact that there are a few people of genius who genuinely enrich humanity by their ideas. But the majority of us are not improved, but harmed, by exposure to the 'higher learning'.

This essay attracted considerable notice and a number of replies, to which Rousseau responded with care. But he did not continue immediately with his works of social criticism. His musical interests intervened, although with some of these his social and moral ideas became entwined. In his *Letter on French Music* (1753), Rousseau criticizes French music as monotonous, thin and without colour because the spoken language (in which all music is rooted) is thus also. This is because, as Rousseau explains in his *Essay on the Origin of Languages* (1755-60, but never completed), the French language has been shaped by the imperatives of calling for help and controlling other people, which require harshness and clarity above all else. In warmer southern climes it is the sweet accents of love and passion which colour the language and hence the supremacy of Italian opera. Thus social and political demands shape even the nature of music, according to Rousseau. Effective government also requires sharp, impressive utterance, he maintains, and it is to the origin and function of government that Rousseau turns in his so-called second *Discourse*, the *Discourse on the Origin and Foundations of Inequality*, to give it its full title. This is a very substantial essay and one of Rousseau's most important works.

In *Discourse on the Origin and Foundations of Inequality* Rousseau gives an account of the 'fall' of natural humankind, its degeneration and corruption as it joins together with others to make up tribes, societies and eventually states. Natural man (the 'noble savage') left alone in his natural environment is self-sufficient, largely

absorbed in present feeling without foresight or recollection, solitary, peaceable and, in fact, most often asleep. (Rousseau may well have had the orang-utan in view here.) Inclement circumstances, increase in numbers (arising from hasty couplings in the forest devoid of all the artificial trappings of romantic love), force people to live together. Sexual jealousy, the desire for domination, vindictive resentments grow up as men come to demand esteem and deference. *Amour-propre*, an anxious concern for tribute to be paid to one's status, replaces *amour de soi*, a simple healthy concern for one's own natural wellbeing. Men begin to compete for precedence and life is tainted by aggression and spite. Those who have acquired dominance then conspire together to consolidate their position. They argue that everyone needs a more peaceable and stable society, which can only be achieved through the apparatus of government, law, punishments. Thus it is that they consolidate the *status quo*, but without right or justice and acting only to perpetuate unfair privilege and the oppression of the weak.

This extraordinarily subversive essay seems to have attracted no official censure; that came later in connection with other works. Rousseau's other significant essay on political themes from this period is the so-called *Discourse on Political Economy* (1755, first published separately 1758), which began life as an entry for Diderot and D'Alembert's *Encyclopaedia* (1751-72; see D'Alembert). A very eloquently written piece, it shows clear signs of being a preliminary study for *The Social Contract*. Much play is made with the idea of the sovereignty of all the people over themselves, expressing their legislative intent through the general will. Emphasis is laid on the need to cultivate patriotic republican loyalties in citizens if a just society of equals united by common care and respect is ever to arise and to survive. The essay ends with a discussion of taxation and fiscal issues, but the principal force of the argument lies in the discussion of the source of legitimate law in 'the people'. It is this same issue which Rousseau places at the centre of his now most famous work, *The Social Contract*.

3 *The Social Contract*

This work is generally regarded as an essential entry in the canon of classic works in political theory and as Rousseau's masterpiece. Many people read nothing else of his. This is a pity, for many of the themes in it are rendered unnecessarily hard to understand by being taken in isolation. Also, the work is in some ways poorly constructed and uses idea drawn from different times in Rousseau's development. As he says in a prefatory note to the work, it is the only residue remaining of a project begun many years before. However, we must take the work as we find it. Its present reputation would perhaps have surprised contemporary readers. *Émile* was considered a more seditious work; and *La Nouvelle Héloïse* regarded as the most perfect exhibition of Rousseau's genius. Certainly Hume regarded Rousseau's own good opinion of *The Social Contract* as quite absurd.

The Social Contract is divided into four parts. Roughly speaking, Book One concerns the proper basis for the foundation of a legitimate political order; Book Two the origin and functions of the sovereign body within that order; Book Three considers the role of government, which Rousseau treats as a subsidiary body in the state deriving its powers from the sovereign; and Book Four considers more issues regarding a just society, treating of the Roman republic at some length and of the functions of civil religion. It is important always to remember that the book is subtitled: *The Principles of Political Right*. Rousseau's paramount concerns are normative, with the nature and basis of legitimacy, justice and right and not simply with *de facto* political structures. A useful brief summary of the principal themes of the work is given in Book Five of *Émile*, as part of Émile's political education.

Rousseau argues that it is our lack of individual self-sufficiency that requires us to associate together into society. But, when we do so, we do not want to have to accept a condition of enslavement as the price of our survival. Freedom is an essential human need and the mark of humanity; mere survival without that does not constitute a human life. Rousseau holds that freedom and association can only be combined if all the persons of the association make up the sovereign body for that association, that is, the final authoritative body which declares the law by which the people wish to bind themselves. This law is a declaration of the 'general will'.

The notion of the general will is wholly central to Rousseau's theory of political legitimacy (see General will). It is, however, an unfortunately obscure and controversial notion. Some commentators see it as no more than the dictatorship of the poletariat or the tyranny of the urban poor (such as may perhaps be seen in the French Revolution). Such was not Rousseau's meaning. This is clear from the *Discourse on Political Economy* where Rousseau emphasizes that the general will exists to protect individuals against the mass, not to require them to be sacrificed to it. He is, of course, sharply aware that men have selfish and sectional interests which will lead them to try to oppress others. It is for this reason that loyalty to the good of all alike must be a supreme (although not

exclusive) commitment by everyone, not only if a truly general will is to be heeded, but also if it is to be formulated successfully in the first place.

This theme is taken up in Book Two. Here Rousseau appeals to the charisma of a quasi-divine legislator to inspire people to put the good of their whole community above their own narrow selfish interest and thereby gain a greater good for themselves. In the course of this Book, Rousseau alludes to Corsica as having a people who have the sentiments and capacities to establish just laws and a good state (Book Two, ch. 10). His passing remark that ‘I have the feeling that some day that little island will astonish Europe’ has caused some fancifully to suppose that he foresaw the emergence of Napoléon.

Book Three of *The Social Contract* concerns the role of government. Rousseau knows that governors often rule in their own interest, not in the interests of their community. For this reason he argues that governmental functions must be thoroughly subordinate to the sovereign judgment of the people and that it is essential to adjust the form and powers of government to suit the different circumstances (size, dispersion and so on) of different states. It still surprises some readers that Rousseau has no particular enthusiasm for democratic government. Of course, the constitution and functions of the sovereign body are a different matter.

Book Four has something of a disjointed character. Rousseau discusses the Roman republic at considerable length, principally to hold it up as a model from which, in his opinion, there has been a terrible falling away. But he also discusses civil religion, arguing that divine sanctions should be joined to civil laws the better to procure obedience to them and people’s loyalty to the common good of all in their nation.

Rousseau made wholly central to his vision of political right the union of free and equal men devising for themselves the laws under which they shall then proceed to live their lives as citizens one with another of their own state. In doing so he depicted a form of political community which exerts a very great appeal and influence on the modern imagination. We are still learning to live with the consequences of that appeal.

Rousseau’s political concerns were not confined to theory alone. On two occasions he was approached for help with the political affairs and constitutional problems of countries. In 1764 he wrote an unfinished fragment, A *Project for a Constitution for Corsica*, in response to a plea for help and guidance from the Corsican rebels. Then again, in 1769-70, Rousseau wrote extensively on the constitutional and legislative problems facing Poland (*Considerations on the Government of Poland*) in response to a request from persons opposed to Russian domination. This work (not properly published in Rousseau’s lifetime) is a substantial essay which throws a lot of light on how Rousseau envisaged his theoretical notions working out in historically specific situations. He reveals many shrewd and hard-headed practical insights.

4 *Émile* (or *On Education*)

There is some evidence that Rousseau regarded *Émile* as his most mature and well-achieved work. In his self-evaluating *Rousseau Judge of Jean-Jacques: Dialogues* (1772-6) he specifies it as the book in which someone who is truly concerned to understand him will find his ideas most deeply and comprehensively expressed. Posterity has, perhaps unfortunately, not generally endorsed this evaluation.

Precisely when he began work on *Émile* is unclear, but it must have been around 1759 when Rousseau was at the peak of his creative powers. Its immediate occasion seems to have been a request from certain of his distinguished women friends to give them his advice about the upbringing of their children; and indeed, the subtitle of the book is *On Education*. However, within this framework Rousseau gives us his deepest ideas about the origins of human evil and wickedness and about the prospects for a whole and happy life.

Émile is structured as the narrative of the upbringing of a young man (Émile himself) who is to be spared the pain and loss of human corruption but made whole and entire by following the teachings of ‘nature’. The work also includes in Book Four, a long more-or-less self-contained essay on the basis and nature of religious belief, called the *Creed of a Savoyard Vicar*. Rousseau puts his religious ideas into the mouth of a fictitious priest, although one modelled on priests he had previously known. It was this section which attracted the condemnation of the Catholic authorities and led to the burning of the book in June 1762. Rousseau then fled Paris, condemned to almost ten years of distress and displacement. He wrote at some length in defence of these religious ideas, in his *Letter to Christophe de Beaumont, Archbishop of Paris* of 1763 (see §5).

Rousseau held that most men and women in contemporary society were corrupted and their lives deformed because of the nature and basis of their social relationships and of the civil order (see §2). That man is good by nature, but is perverted by society is perhaps the dominant theme of *Émile*. Thus, if a person is to live a whole and rewarding life they must first be protected from such damaging influences and then be given the personal resources and emotional and moral dispositions to enable them to develop in a creative, harmonious and happy way once they do enter society. The principal discussions in *Émile* are devoted to studying the deepest causes of health or sickness in human development, both those internal to the individual and those coming from external influences, at each stage in the growth and maturation of a person from infancy to adulthood.

In early life it is the tendency to imperious rage and the petulant demand for others' immediate compliance to one's wishes that must be checked. Children must certainly not be tormented, but neither must they be indulged since that gives rise to both misplaced expectations and to even less capacity to cope with setbacks. Children need to be treated in a steady, predictable and methodical way, as if not in contact with other humans at all at first. Thus they learn to manage in a practical and efficacious way with concrete issues and not to engage in a battle of wills and in contention for dominance.

This motif of living according to nature - that is, according to the actualities of our powers and real circumstances - continues as Émile matures. As and when he needs to find a place for himself in society he will not try to control all that is around him and be aggrieved if he cannot as if he were a despot. Rather, he will seek to establish relations grounded in friendship, mutual respect and cooperation proper to finite and needy beings. Our capacity to feel compassion for each other and our acceptance of compassion with gratitude forms, in Rousseau's view, the fundamental basis for human union and the true explanation of the Golden Rule. Real moral demands are not imposed on us from outside, nor are they precepts discovered by reason. Rather, they express the requirements by which a bond of creative respect can be sustained between equals. This same issue of maintaining self-possession and mutual respect shapes Rousseau's treatment of marriage and sexual relations in Book Five. Such intimate union holds out the greatest hopes of human happiness, but can also lead to enslavement to the whims of the beloved. Feminist critics have found Rousseau's depiction of the character and role of Émile's intended, Sophie, objectionable, in that she appears to be stereotyped as largely passive and destined for traditional domestic occupations.

In the controversial material on religious belief Rousseau argues that we know God not by reason, but through simple feelings and convictions much deeper and more permanent than any theorems of reason. Such feelings teach us that the world is animated by a loving and powerful intelligence, who is God. Rousseau spends some time denouncing religious factionalism and intolerance which he sees as wholly incompatible with Christ's message of love and forgiveness. There can be no serious doubt that these are Rousseau's own thoughts. The rhetorical distance provided by the figure of the vicar is very slight.

In his deep and subtle psychological insights into the damage aggression does, not just simply to the victims of aggression, but in a complex and concealed way to the aggressors themselves, Rousseau shows the greatness of his mind in *Émile*.

5 Controversial works

Rousseau did not take the condemnation of the *Creed of a Savoyard Vicar* lightly. Almost as soon as he had settled again after his flight from Paris, he wrote a lengthy reply to the criticism of his work made by Christophe de Beaumont, Archbishop of Paris. Written in the form of a letter, Rousseau defends the fundamental tenets of his work. He has always held, he says, that man is naturally good, but corrupted by society. It is therefore a mystery why his work should only now be singled out for condemnation. He then mounts a point-by-point reply to the Archbishop's criticisms, arguing that the religion of the priests and the dogmas of the church must never be confused with the true gospel of charity and love taught by Christ. This *Letter to Christophe de Beaumont, Archbishop of Paris* was published in 1763. It ends on a note of self-aggrandizement. So far from being reviled, Rousseau says, statues of himself should be erected throughout Europe.

Just a year later, Rousseau published his extensive *Lettres Écrites de la Montagne (Letters Written from the Mountain)*. In 1763, the Genevan attorney-general, Jean-Robert Tronchin, had written in defence of the authorities in their condemnation of Rousseau's works in his *Letters Written from the Country* (hence Rousseau's oppositional

title). Rousseau again replies at length, arguing that the Geneval political system had become very corrupt, but also defending once more the basic principles of his thought.

These two works date from the period just after the condemnation of Rousseau's most famous works. But prior to that he had also been engaged in some controversial exchanges. In 1758 he wrote the *Letter to M. d'Alembert on the Theatre* in which he argues that to establish a theatre in Geneva would corrupt the honest morals and civil integrity of that city-state. This was in opposition to D'Alembert's argument, presented in an article on Geneva for the *Encyclopaedia*, that a theatre would improve the cultural life of that city. However, such sophistication is not a benefit, in Rousseau's opinion; it goes along with deceit and the abandonment of morally commendable activities. Rousseau writes with great verve in this essay, harking back to some of his themes in his first discourse, *Discourse on the Sciences and Arts*.

A similar clash between urbane civilization and (what Rousseau liked to see as his own) plainness and simplicity of heart occurs in the exchange with Voltaire on the providence of God (written in 1756; Voltaire may also have been an influence on D'Alembert). Voltaire, in his poem on the Lisbon earthquake, had written scornfully of Leibnizian optimism that all is for the best in the best of all possible worlds. Rousseau retorts that one must rest one's certainty of God's providence in feeling, not on the subtleties of philosophical reasoning. More personally, he says that it is surprising to find the wealthy and successful Voltaire complaining against God when he, Rousseau, who lives in poverty and obscurity, sees only the blessings of existence. This *Letter to Voltaire on Providence* also makes some very sharp points against religious intolerance, prefiguring the ideas of the *Creed of a Savoyard Vicar*. Rousseau's controversial writings are among his most eloquent, even though they do not generally add much to our appreciation of his overall intellectual achievement.

6 *La Nouvelle Héloïse* and other literary works

Outside the narrow circle of the intelligensia and his aristocratic patrons, Rousseau was probably best known during his lifetime for his novel of illicit passion, reconciliation and self-transcendence, *Julie, ou La Nouvelle Héloïse*. At a time when works in different genres were not so sharply compartmentalized, David Hume for one saw in this novel the most perfect expression of Rousseau's genius and could not understand why Rousseau seemed to value *The Social Contract* more.

Rousseau professed himself surprised and dismayed to be writing the work. In 1756 he had turned his back on the hot-house world of fashionable Parisian society, wishing to dedicate the rest of his life to working for the good of humankind. However, as he took solitary walks in the forest of Montmorency, be became absorbed in an imaginary world of passion and illicit love. In a fever of erotic ecstasy he wrote the first of the letters between Julie, her tutor-lover Saint-Preux and her friend and cousin Claire. Saint-Preux confesses his love for Julie; a love which she tries to fend off through intimate conversations instructing him to be virtuous and pure. Of course, this does not work and she finally gives herself over to him in a passion. But her father has other plans for her. She is betrothed to the Baron de Wolmar; Saint-Preux leaves and not until much later does he return to become tutor once more, but now to Julie's two young sons. Wolmar (who has come to know of their earlier intimacy), leaves Julie and Saint-Preux alone on his model estate at Clarens. Saint-Preux confesses that he had never ceased to love Julie, but the novel ends tragically with the death of Julie, who has contracted pneumonia after having saved one of her children from drowning.

As Rousseau wrote this work nature seemed to imitate art. Sophie d'Houdetot, the sister-in-law of Madame d'Épinay whose house Rousseau was then living in, visited him and Rousseau fell in love with her. He saw in her the incarnation of his imaginary Julie. The relationship did not endure. Rousseau became morbidly suspicious that his middle-aged love was being mocked behind his back by his erstwhile friends.

La Nouvelle Héloïse was published in 1761 and was a bestseller. It is seldom read these days, except to be mined for ideas which might illuminate Rousseau's social and political philosophy. Wolmar's model estate is sometimes argued to be Rousseau's own vision of an ideal community, with rigid paternalistic control and substantial manipulation of the inhabitants by the all-seeing, all-knowing Wolmar. It is scarcely clear that this was Rousseau's intention. The fact that Julie dies, despite living at Clarens, may be taken to imply that it provides no adequate human habitation.

The rest of Rousseau's literary output is slight. It includes a number of mostly short poems, dating from the early

1740s, some plays (also mostly early), one of which *Narcissus* (Self-Lover), received performance in 1752 and for which Rousseau wrote a substantial preface explaining how his theatrical writing could be squared with his then political and social polemic against civilized letters.

7 Autobiography and other personal works

The last ten or so years of Rousseau's life were primarily given over to the writing of works of autobiography and other substantial essays of self-explanation and justification. These were presaged in his four *Letters to Malesherbes* written in 1762, just before the catastrophe of the banning of *Émile* and *The Social Contract*. Malesherbes, although official censor and likely to be suspicious of Rousseau's subversive ideas, in fact took a highly intelligent and sympathetic interest in his work. Rousseau became fearful that the printing of *Émile* was being held up by Jesuit plotting. Through Madame de Luxembourg, Malesherbes was contacted and able to put Rousseau's mind to rest. Rousseau expressed his gratitude by writing to Malesherbes four semi-confessional letters, setting out the principal events of his life and trying to make his motives and character plain to Malesherbes. Rousseau writes that he is not a misanthrope; he seeks the country only because he can live there more freely and fully as himself. He wants, in fact, nothing more than to serve humankind, but he can best do this by keeping himself apart and not getting embroiled in quarrels and back-stabbing.

Around this time Rousseau began to assemble materials towards writing an autobiography. He worked on and off at this until 1767, by which time part one of what we now know as *Confessions* was completed. This still extraordinary work of self-disclosure and candour is one of the most remarkable books ever written. It includes some beautiful writing about childhood and about his travels, but also revelations of a most intimate and shameful kind. Part one covers the period up to 1741-2, when Rousseau left Madame de Warens to make his way in Paris. Part two (1769-70) is less successful. Rousseau's morbid fears sometimes surface here as he describes the events of the years 1742-65, including his foolish passion for Sophie d'Houdetot, the writing and publication of *Émile*, and so on. The book breaks off in 1765, just as Rousseau is about to leave for England in the company of Hume, there (he believed) further to be ensnared. As the revelation of the quality of being of another human soul, *Confessions* is almost without equal.

Another lengthy work of self-explanation is *Rousseau Judge of Jean-Jacques: Dialogues* (published, like *Confessions*, posthumously). This is in three parts, cast in the form of dialogues between 'Rousseau' and 'a Frenchman', who together try to delve beneath the surface to find out the true nature of 'Jean-Jacques', the real Rousseau. The innumerable lies put about regarding Jean-Jacques are considered and exposed in the first part; in the second, a visit is paid to him and his true character is revealed; in the third part, a careful reading of his works is made and their true meaning explained. Although sometimes obsessively detailed and very repetitive, this work has considerable interest for the light it throws on Rousseau's own estimate of his achievement. The overall tone is, it is thought, marred by lengthy self-justification.

Rousseau's last work of self-accounting is *Reveries of the Solitary Walker* (left unfinished at his death). Cast in the form of 'Walks', it comprises a series of reflections, ideas and meditations which supposedly occurred to Rousseau as he went on his perambulations in and around Paris. Rousseau returns to special moments in his life - his love for Mme de Warens; the episode of the stolen ribbon; his 'illumination' on the way to see Diderot. But he also reflects for one last time on some of his major intellectual preoccupations - on the depth of *amour-propre*; on the sources of malice and on the nature of happiness. There is a clear steadiness of vision which pervades this work which contrasts markedly with the often distressed and distressing writing of the preceding five years.

After his death, Rousseau's grave on the Île des Peupliers at Ermenonville became a place of pilgrimage for Parisians and Rousseau was embraced as one of the great sons of France. His influence remains very great, not only because of his political writings which have become part of the permanent canon of works in political theory, but also because of his more imponderable effect on sensibility and attitudes. His love of nature and stress on the value of the simple life, as well as his far-reaching explorations of his own character and feelings, make him a central figure in the development of romanticism. The emphasis in his educational writings on discouraging the coercion of the child into tasks which are apparently pointless, undoubtedly influenced the work of Montessori and A.S. Neill (see Education, history of philosophy of). Even Rousseau's musical writings and compositions, seldom studied these days, made a marked impact on the history of opera in particular. His place as one of the major figures of Western civilization is secure, even though he can still attract violent differences of opinion.

NICHOLAS DENT

List of works

There is no complete standard English translation of Rousseau's works. The most ambitious undertaking (edited by Masters and Kelly) is still in progress. It is listed here with two French editions of Rousseau's complete works, followed by selected works in French and English and individual works in English.

1 Collected works

Cole, G.D.H. (ed. and trans.) (1973) *The Social Contract and Discourses*, London: Dent.(Revised and augmented by J.H. Brumfitt and J.C. Hall. Contains principal writings on political theory; an excellent selection in English.)

Gagnebin, B. and Raymond, M. (eds) (1959-95) *Jean-Jacques Rousseau: Oeuvres Complètes*, Paris: Gallimard, 5 vols.(The standard modern edition.)

Grimsley, R. (ed.) (1970) *Rousseau: Religious Writings*, Oxford: Clarendon Press. (Selected works in French.)

Launay, M. (ed.) (1967-71) *Rousseau: Oeuvres Complètes*, Paris: Éditions du Seuil, 3 vols.(Also valuable.)

Leigh, R.A. (ed.) (1965-89) *Correspondance Complète de Jean-Jacques Rousseau*, Geneva and Banbury: Voltaire Foundation, 50 vols.(One of the greatest scholarly achievements of this century and an indispensable source for Rousseau studies.)

Mason, J.H. (ed.) (1979) *The Indispensable Rousseau*, London: Quartet.(Offers selections in English from across the total range of Rousseau's writings.)

Masters, R.D. and Kelly, C. (eds) (1990-) *The Collected Writings of Rousseau*, Hanover, NH and London: University Press of New England, 5 vols to date.(Vol. 1: *Rousseau Judge of Jean-Jacques* (1990); vol. 2: *Discourse on the Sciences and Arts and Polemics* (1992); vol. 3: *Discourse on the Origin of Inequality, Polemics and Political Economy* (1992); vol. 4: *The Social Contract and short pieces* (1994); vol. 5: *Confessions* (1995) - the most up-to-date English translation, with excellent notes.)

Vaughan, C.E. (ed.) (1915) *The Political Writings of Jean-Jacques Rousseau*, Cambridge: Cambridge University Press, 2 vols.(Selected works in French.)

2 Individual works

Rousseau, J.-J. (1743) *Dissertation on Modern Music*, trans. L. Hewitt, in *Project Concerning New Symbols for Music*, Kilkenny, 1982.

Rousseau, J.-J. (1750) *Discourse on the Sciences and Arts*, in G.D.H. Cole (ed. and trans.) *The Social Contract and Discourses*, London: Dent, 1973; also in V. Gourevitch (ed.) *The First and Second Discourses together with the Replies to Critics*, New York: Harper & Row, 1986.

Rousseau, J.-J. (1753) *Letter on French Music*, trans. in part in *Source Readings in Music History*, O. Strunk (ed.) London: Faber & Faber, 1950.

Rousseau, J.-J. (1755) *Discourse on the Origin of Inequality*, in G.D.H. Cole (ed. and trans.) *The Social Contract and Discourses*, London: Dent, 1973; also in V. Gourevitch (ed.) *The First and Second Discourses together with the Replies to Critics*, New York: Harper & Row, 1986.

Rousseau, J.-J. (1755) *A Discourse on Political Economy*, in G.D.H. Cole (ed. and trans.) *The Social Contract and Discourses*, London: Dent, 1973; also in R.D. Masters (ed.) *On The Social Contract with Geneva Manuscript and Political Economy*, New York: Harper & Row, 1978.

Rousseau, J.-J. (1755-60) *Essay on the Origin of Languages*, in J.H. Moran and A. Gode (eds) *On the Origin of Languages*, New York: University of Chicago Press, 1966; also in V. Gourevitch (ed.) *The First and Second Discourses together with the Replies to Critics*, New York: Harper & Row, 1986.(Written around 1755-60, but not completed.)

Rousseau, J.-J. (1756) *Letter to Voltaire on Providence*, trans. in part in *The Indispensible Rousseau*, J.H. Mason (ed.) London: Quartet, 1979.

Rousseau, J.-J. (1757-8) *Moral Letters*.(No English translation currently available.)

Rousseau, J.-J. (1758) *Letter to M. d'Alembert on the Theatre*, in A. Bloom (ed. and trans.) *Politics and the Arts: Rousseau's Letter to M. d'Alembert*, Ithaca, NY: Cornell University Press, 1960.

Rousseau, J.-J. (1761) *La Nouvelle Héloïse*, abridged and trans. J.H. McDowell, Philadelphia, PA: Pennsylvania State University Press, 1968; also trans. W. Kenrick, *Eloisa, or a Series of Original Letters*, Oxford:

Woodstock Books, 1989.(Facsimile reprint of an 1803 translation).

Rousseau, J.-J. (1762) *Letters to Malesherbes*, in C.W. Hendel (ed. and trans.) *Citizen of Geneva*, Oxford: Oxford University Press, 1937.

Rousseau, J.-J. (1762) *Émile*, or *On Education*, trans. A. Bloom, New York: Basic Books, 1979; repr. London: Penguin, 1991.

Rousseau, J.-J. (1762) *The Social Contract*, in G.D.H. Cole (ed. and trans.) *The Social Contract and Discourses*, London: Dent, 1973; also in R.D. Royce, Josiah (1855-1916)

Josiah Royce rose from a humble background in the California of the Gold Rush period to become Professor of the History of Philosophy at Harvard University and one of the most influential American philosophers of the so-called 'period of classical American philosophy' from the late nineteenth to the early twentieth century. He was also (along with F.H. Bradley) one of the two most important English-speaking philosophers of the period who defended philosophical idealism: the doctrine that in some sense or other all things either are minds or else are the contents of minds. Royce remained loyal to his own idealist commitments throughout his life, despite the fact that his friend and Harvard colleague William James was extremely hostile to idealism, and that his intellectual environment was increasingly dominated by the 'pragmatism' of which James was an outspoken champion. In later years, however, under the influence of another pragmatist, Charles S. Peirce, Royce gave the themes of his idealist thought a naturalistic social foundation rather than the abstract metaphysical foundation of his earliest writings. Royce's entire corpus is perhaps best seen as representing a bridge from the German world of Neo-Kantianism and various varieties of philosophical idealism to the American world of pragmatism and of philosophical naturalism.

1 Life

Josiah Royce was born on 20 November 1855 in Grass Valley, California. In the spring of 1866 Royce's family moved to San Francisco, where he attended grammar school and high school. From 1870 to 1875 Royce was a student at the University of California. From 1875 to 1876 he studied in Germany, principally among thinkers who were revitalizing Kant's thought or defending and modifying Hegel's thought. From 1876 to 1878 Royce did graduate work at The Johns Hopkins University, where he gave a series of lectures entitled *On the Return to Kant*, in which he both expounded and defended Kant. Royce received the Ph.D. degree from Johns Hopkins in 1878.

From 1878 to 1882 Royce taught English at the University of California at Berkeley, and during this period he married. In 1882, taking his wife and their new child with him, Royce went to Harvard University to replace William James, who was on temporary leave. This appointment developed into an assistant professorship in 1885; eventually, in 1892, Royce obtained a full professorship in the history of philosophy. In 1914 Royce was appointed Alford Professor at Harvard. Except for brief excursions, Royce remained at Harvard from his initial appointment in 1882 until his death on 14 September 1916.

In American philosophy prior to the First World War, Royce was an even greater force than James. He had many distinguished students, among them George Santayana, W.E.B. Du Bois, T.S. Eliot, and C.I. Lewis.

2 Ethical theory

Besides his work in mathematical logic, Royce's philosophical thought concentrated on ethics and on metaphysics, which latter topic included philosophy of religion. In both ethics and metaphysics Royce's thought was heavily influenced by Kant, much of whose philosophy Royce absorbed from Neo-Kantians during his year of study in Germany.

In his ethical theory, espoused for example in his book *The Philosophy of Loyalty* (1908a), Royce's highest ethical principle appealed to the idea of acting from 'loyalty to loyalty', a formula in which Royce captured an ethical notion closely akin to Kant's notion of acting 'from duty'. Just as Kant held that acting from duty meant acting in such a way that one's motive for acting is to be in accord with the ideal of duty itself, so Royce held that acting out of loyalty to loyalty meant acting in such a way that one's motive for acting is to be consistent with the ideal of loyalty in general (see Kantian ethics). With the beginning of the First World War the ethical dimensions of Royce's thinking took on a pronounced social and geopolitical air. Royce even wrote a treatise in 1914 on geopolitical morality, published as *War and Insurance*. Shocked by the German sinking of the *Lusitania* in 1915, Royce became a vehement supporter of the Allies, and 'loyalty' acquired in his usage a certain patriotic flavour. In general, however, the meaning of 'loyalty' in Royce's ethical thought is akin to that of 'commitment', and not to any especially patriotic or chauvinistic notion.

In his ethical thinking during the last four or five years before his death, Royce was going beyond a mere ethics of duty and freedom and was pressing towards a more general ethics of responsibility and the 'fitting'. The very last

of Royce's ethical thoughts were devoted not so much to an attempt to specify the nature of right and wrong as to an effort to describe and justify the proper approach to life and life's challenges that a wise person takes.

In this regard Royce distinguished three stages of ethical maturity. In the first and least mature stage, the moral agent acts more or less naively, aiming their efforts at achieving goals. As a moral being, the agent attempts to be loyal to loyalty, and so to fulfil their duties and in general live a responsible life. But the agent has not yet confronted the difficulties life has to offer, its pains, frustrations, anxious cares, crushing burdens, demoralizing defeats. With such features of life the ethical agent still must learn to contend.

At the second, somewhat more mature, ethical stage the agent responds to the pains of life by achieving a kind of quiet resignation, turning inwards onto the self, that is to say towards meditation, self-control and self-alteration. But in this resignation to suffering, the agent ceases to attempt to alter the external world, or indeed anything in their relation to the external world other than the self. Indeed, this approach is broadly the stance of the mystic, the introvert, the meditator. Royce associates the second stage of ethical existence with some of the disciplines of oriental philosophy and religion.

At the third and highest stage of ethical maturity, the agent has transcended both the naive stance of the first stage and the quietistic resignation of the second. Once again the agent is an active agent attempting to change the external world and not merely the self. But now the agent is fully aware of life's sufferings and of the fact that very probably most of their efforts, perhaps even all of them, will be in vain. Nevertheless, the agent acts, not expecting that the efforts will be rewarded with success. At this third stage, the object of acting is moral action in itself.

Royce's late ethics has a great deal in common with certain strains of twentieth-century thought in what has been called 'existentialism'. In particular it has a great deal in common with that variety of existentialism labelled 'absurdism' by the French philosopher Albert Camus. For Royce, just as for Camus, the mature life of bliss is to be found not in achievements but rather in strivings, not in what is accomplished but rather in the manner and quality of what is attempted (see Existentialism). Only in the ethical life of striving while remaining free of all expectations regarding results is an agent immune from the frustrations of the first ethical stage and from the introspective isolation of the second.

3 Metaphysics

Royce's position in metaphysics was his own particular brand of idealism, which, despite its unique features, naturally had affinities with other forms of idealism. It had, for example, affiliations with the so-called 'subjective idealism' of Berkeley, whose principal doctrine was that all things are either minds or the contents of minds. Royce's idealism also in many key respects resembled the so-called 'transcendental idealism' of Kant, whose principal doctrine is that the objects of experience have no intelligibly conceivable existence outside of experience. In other respects Royce's position resembled the so-called 'metaphysical idealism' of Hegel, whose principal doctrine is that the world as we understand it is the evolutionary unfolding of a mental principle that we can call 'Spirit' (see Berkeley, G. §3; Hegel, G.W.F. §4; Idealism; Kant, I. §5).

The chief feature of Royce's early idealism that set it apart from other varieties of idealism was his doctrine of the existence of what he called a 'Universal Consciousness' or 'Absolute Mind'. He conceived this as a kind of overarching, all-embracing mind or consciousness in which all particular thoughts, as well as all the objects of these thoughts, along with all finite minds, are in some fashion 'contained'. This doctrine of the 'Universal Consciousness' was the burden of Royce's first major book *The Religious Aspect of Philosophy* of 1885, the year of his appointment at Harvard to an assistant professorship. In his doctrine of the Universal Consciousness, Royce aimed to capture in philosophical terms a sense of the radically immediate presence of the Divine Being. The spiritual thrust of Royce's philosophizing remained a steady feature of it throughout his career.

Despite the religious import of the doctrine of the Universal Consciousness, however, Royce tried in his work of 1885 to base this doctrine entirely on a semantical and logical analysis of the concepts of knowledge and truth. He began with two initially plausible assumptions. The first was that knowledge and truth presuppose reference. The second was that reference is to be analysed in such a way that objects of reference are completely determined purely by the referential intentions of referring minds. We may call this latter assumption the assumption of pure referential intentionalism.

Pure referential intentionalism has the consequence that all objects of reference are internal to minds. In particular, objects of reference are internal to the minds that achieve reference to such objects simply by means of having the referential intentions that they do. This consequence obviously involves an idealist commitment of some sort. But in order to see the particular form of idealism that Royce elicited from it, let us consider that the consequence raises a number of problems. How, for example, given this consequence, can two different minds refer to (and thus know) one and the same thing? Indeed, how even can one mind refer to (and thus know) one and the same thing on two different occasions? How can anyone ever make an error in judgment (since even in making a mistake in judging one must, it would seem, surely know that to which one refers)? Royce argued that the doctrine of the Universal Consciousness was required in order to solve these and other such problems, in particular that of the possibility of error.

With only minor changes this doctrine of the Universal Consciousness persisted in Royce's writings through his turn-of-the-century Gifford Lectures that were published as the two-volume work *The World and the Individual* (1899-1901).

The theory of knowledge and truth defended by Royce was soon to be attacked by William James in his works on pragmatism. Indeed, James's own pragmatic theory of truth was a direct response to the Roycean idealist challenge (see James, W. §5). James's main task was that of accounting for reference and truth without committing himself to an idealism that he considered absurd. Thus his task was to account for reference and truth on some basis other than pure referential intentionalism. Ultimately his pragmatism took a position according to which reference is determined not purely by referential intentions but also and more importantly by unbroken chains of causal connection stretching from referential intentions to objects of reference. Such objects, then, need not have a purely mental status but may consistently be regarded as being outside minds and in the external world. Not surprisingly, Royce and James enjoyed almost daily debates with one another on the topics of reference and truth until James's death in 1910. One of the most important of the historical consequences of Royce's thought is this influence on the development of James's version of pragmatism.

Not only was Royce an original philosopher - in particular an original idealist philosopher - in his own right: he was also a serious student of the history of philosophy. Indeed, although the bulk of his work was devoted to his own philosophical creation, still great portions of it were almost entirely devoted to the history of philosophy, for example almost all of *The Spirit of Modern Philosophy* and *Lectures on Modern Idealism*. His interest in the history of philosophy was simply a part of his interest in history more generally, and he devoted several years to writing on the history of his native state, California. Royce's interest in the history of thought led him to become accomplished in a wide variety of subjects, among them even such specialized subjects as the Sanskrit language.

4 Mathematical logic

A little-known side of Royce's intellectual life is his deep interest in mathematical logic and his extensive work in this area. Indeed, Royce introduced the topic of mathematical logic into the curriculum at Harvard, and by means of his own efforts and later those of his student C.I. Lewis, logic remained one of the mainstays of the Harvard philosophical experience. Royce's interest in logic was present as early as 1881, when he wrote for the benefit of his students at Berkeley his *Primer of Logical Analysis*. At this time he evidenced in his private diaries his concern to develop a logic that would be relevant to the theory of space. In this project Royce was aligning himself with the Kantian idea of a 'transcendental logic', that is to say a logic in which the structure of space and time plays a major role.

Royce seems to have left his logical concerns to lie dormant, however, until they were revived by Charles S. Peirce in 1898, when Royce attended Peirce's Cambridge Conference Lectures entitled *Reasoning and the Logic of Things* (see Peirce, C.S. §8). In these lectures Peirce showed that the forms of logic were in fact intimately connected with the forms of spatial structure; indeed, Peirce presented in the lectures a geometric form of logic that he had invented, called 'Existential Graphs'. Thus Peirce showed that Royce's earlier ideals with regard to logic were capable of detailed, technical fulfilment.

Peirce also fired Royce's logical and mathematical imagination in other ways. For example, he introduced Royce to the thought of the English mathematician A.B. Kempe, who had been a student of Augustus de Morgan, and who in the 1890s was an officer and leading figure in the London Mathematical Society. Kempe was considered

by Peirce to be the world's greatest logician. As early as 1890, Kempe had published a number of works in which he had attempted to reduce all mathematical form to certain special forms, and in which he had attempted to show deep similarities between the most basic structures of logic and the fundamental geometrical structures. Of particular interest to Royce was Kempe's paper 'The Relation between the Logical Theory of Classes and the Geometrical Theory of Points'.

From the time of Peirce's Cambridge Conference Lectures until at least as late as 1910, Royce worked assiduously on mathematical logic, indeed with a fierce enthusiasm. His goal was in accord with his earlier, ultimately Kantian ideals, namely to amalgamate mathematical logic with the theory of space. By the second volume of *The World and the Individual*, composed around 1900, Royce was already utilizing the fruits of his own original mathematical and logical researches, for example in describing space as a certain kind of logical order. By 1905 he had developed what he called his 'System Sigma'. This mathematical system was similar to Kempe's system for analogizing logic and geometry, but it attempted to remove various imperfections that Royce perceived in Kempe's theory, the most important of which concerned the notion of an individual.

Royce had a subsidiary and ancillary mathematical interest in what were called Boolean functions. In connection with this subject Royce studied A.N. Whitehead's researches into Boolean algebra. Royce was one of the first mathematical thinkers to discuss what are now called 'Boolean rings'. Another of his interests was the mathematical and logical paradoxes, including 'Russell's Paradox', and the foundations of set theory (see Russell, B.A.W. §§4-7). By 1905 Royce had proposed a set theory that would be 'non-foundational', that is to say, a set theory in which it is allowable to have infinitely descending (ordered by the relation of set membership) sequences of sets.

5 Ultimate position

During the last years of his life, Royce was beset by various health and family problems, but his philosophical production was undiminished. Indeed, *The Problem of Christianity*, which is widely regarded as his greatest work, was published only in 1913. In this work, under the influence of Peirce, Royce modified his earlier idealism into a powerful philosophical position, not unlike that of the later Wittgenstein in that its major themes are language and in particular the social functions of language. Central to the development in this work of Royce's own theory of the community is his employment of Peirce's ideas concerning the 'triadic' character of the notion of interpretation. For Royce the community is in essence a community of interpretation. It is an organic whole whose parts are individual persons, in which each of the parts has its place in a crisscrossing series of interpretations: each member interprets (things) to each other member. The resultant network of interpretation is the community. This idea is Royce's most mature expression of the idealistic thesis that was expressed in his earlier work by employing the metaphysical notion of the Absolute Consciousness. For the philosophical role played earlier by the Universal Consciousness comes to be assumed by the 'Community of Interpretation'. In this down-to-earth, as it were 'naturalized', version of idealism, the spiritual concerns that had driven Royce's earliest idealistic thought were unattenuated: indeed, as the title of his master work indicates, these concerns were made even more conspicuous in that work than ever before.

This edition includes an extremely valuable introduction by Kenneth Laine Ketner and Hilary Putnam.)

Rozanov, Vasilii Vasil’evich (1856-1919)

Vasilii Rozanov, a prominent spokesman of the Russian Religious-Philosophical Renaissance, is known for his writings on sex, marriage and the family, his attacks on Christian asceticism, and his love-hate attitude to Judaism. He termed Judaism a religion of life because it sanctified sex and the family, and Christianity a religion of death because it exalted celibacy. But Rozanov also charged that Judaism mandated ritual murder and that Jews were feeding off Russians. In Apokalypsis nashego vremeni (The Apocalypse of Our Time) (1917-18), he apologized for his anti-Semitic pronouncements and blamed the Bolshevik Revolution on Christian otherworldliness and sexlessness. In private life, Rozanov was a pillar of the Church, which he regarded as a haven of beauty, warmth, and spiritual succour.

Rozanov’s writings contain brilliant insights, contradictions, distortions and outright lies. ‘Falsehood never tormented me’, he wrote, ‘and for a strange reason. What business is it of yours precisely what I think?*’ He championed conservative policies in articles published under his own name and radical policies under a pseudonym. It is clear, however, that Rozanov was deeply religious and that he associated sex and the family with God. ’Dirty diapers and a naked wife: this is the truth of Bethlehem around you.’*

Rozanov’s interpretations of Dostoevskii, Gogol’ and other Russian authors were original and perceptive. His collections of aphorisms Solitaria (1912) and Opavshie list’ia (Fallen Leaves, 2 vols) (1913b, 1915), are considered masterpieces of Russian style.

1 Biography and early works

Rozanov was born in Vetluga, Kostroma province. The death of his father, a minor forestry official, when Rozanov was 5 plunged the family into poverty. His mother was too overworked to provide the love and attention that he craved. Rozanov was 13 when she died; his first reaction was that now he could smoke openly. He attended gymnasia in Kostroma, Simbirsk and Novgorod, and the Historical and Philological faculty at Moscow University, graduating from the latter in 1881. In his third year he married Apollinaria Suslova, Dostoevskii’s former mistress and twenty years Rozanov’s senior, in a bizarre attempt to be close to the great writer. Suslova left him in 1888, but cruelly refused consent to a divorce. In 1889, Rozanov met Varvara Rudneva, a young widow. Two years later they were married in an unofficial church ceremony which was conducted secretly lest he be prosecuted for bigamy. He had to adopt their five children formally.

Between 1880 and 1893 Rozanov taught history and geography in provincial gymnasia, hating every moment and writing in his spare time. His articles appeared in a variety of newspapers including the ultra-conservative *Novoe vremia (New Times)*. His first book, *O ponimanii (On Understanding)* (1886), an attack on positivism, was ignored by the critics and sold very few copies. But *Legenda o velikom inkvizitore F.M. Dostoevskogo (Dostoevsky and the Legend of the Grand Inquisitor)* (1891) attracted the attention of the influential literary critic Nikolai Strakhov (1828-96) who found Rozanov a minor bureaucratic job in St Petersburg, thereby enabling him to leave teaching. In 1899, Rozanov became a staff writer for *Novoe vremia*. His next books - *Literaturnye ocherki (Literary Sketches)* (1899), *Sumerki prosveshcheniia (The Twilight of Enlightenment)* (1899), *Religiia i kul’tura (Religion and Culture)* (1899) and *Priroda i istoriia (Nature and History)* (1900) - were collections of previously published articles, most of which had a conservative Slavophile bent. He was then seeking a Christian metaphysic of culture. Later on, he publicly endorsed the Holy Synod’s excommunication of Tolstoi, but he criticized its impersonal and bureaucratic handling of the matter. Rozanov would have preferred that Tolstoi be ’driven out of the Church’ by a band of outraged peasants whose religious sensibilities he had offended.

Around the turn of the century, Rozanov began to associate with Symbolists and Decadents even though he disapproved of their ‘unnatural’ writings. He published in *Mir iskusstva (The World of Art)*, had a regular column, ’In My Own Corner’, in *Novyi put’ (New Path)*, and was a prominent member of the Religious-Philosophical Society of St Petersburg. Instrumental in obtaining permission for the meetings, he was the only founding member who was a personal friend of some of the clerics.

In 1905-6, Rozanov wrote pro-revolutionary articles under a pseudonym (Varvarin) for *Novoe slovo (New Word)* in which he associated revolution with youth and described the autocracy as a ’weakening fetish’. He reprinted

these articles under his own name in *Kogda nachal'stvo ushlo (When the Authorities Went Away)* (1910). In *Fallen Leaves II*, he wrote, 'Politics must be destroyed, apoliticism established… by confusing all political ideas. …By making ''red'' ''yellow'' and ''white'' ''green'''. Laura Engelstein maintains that Rozanov was consciously trying to 'disorganize' public discourse by 'wreak[ing] havoc with the conventions of serious prose and responsible argument' (1992: 314).

Rozanov welcomed the First World War as the beginning of Russia's renaissance. He hailed the February Revolution and was going to 'compose an ideology' for it, but the Bolshevik Revolution was a disaster for him. When the Bolsheviks closed *Novoe vremia* he moved, with his family, to Sergeev Posad, near the Holy Trinity Monastery. He died of starvation and exhaustion, after having the priests administer the last rites nine times. At his request he was buried next to Konstantin Leont'ev (1831-91) in the monastery cemetery.

Leont'ev, Dostoevskii and Nietzsche were the major intellectual influences on Rozanov (see Leont'ev, K.N.; Dostoevskii, F.M.; Nietzsche: impact on Russian thought). He and Leont'ev corresponded in 1890-1, drawn together by mutual hostility to positivism, liberalism and democracy, and by concern for the future of Russia and of Christianity. But Leont'ev ridiculed the 'rosy-coloured' Christianity of Dostoevskii and Tolstoi and regarded Old Testament Judaism as a religion of fear. Rozanov pictured Jehovah as a father, a giver of life and a founder of families. Both writers were called the 'Russian Nietzsche' - Leont'ev because of his elitist aestheticism and Rozanov because of his diatribes against Christianity and his unabashed amoralism. 'Morality', Rozanov wrote, 'I don't even know how to spell it'. In sharp contrast to Nietzsche, Rozanov idealized domesticity and found supreme beauty in the face of Jesus and in church rituals. Trotsky called Rozanov the 'poet of the cosy corner'.

2 Sex, marriage and the family

Rozanov's first writings about sex, marriage and the family were motivated by his personal situation. *Semeinyi vopros v Rossii (The Family Question in Russia)* (1903), treated the legal and social status of the family, interspersing letters, newspaper reports and statistics with his own commentary. Rozanov considered the increase in illegitimacy, abortion, and prostitution symptoms of the decay of marriage, which he blamed on the Church. He advocated easy divorce as a way to revitalize the family and urged that the very concept of illegitimacy be abolished. An earlier work, *V mire neiasnogo i nereshennogo (In the World of the Obscure and Unresolved)* (1901), was banned as pornographic because it included a letter from a correspondent who claimed that circumcision had improved his sexual performance. In articles published in *Mir iskusstva*, Rozanov praised the sun-worshipping (life-affirming), phallic religions of the Ancient Near East.

Throughout his life, Rozanov proclaimed the sanctity of family life and the metaphysical and religious significance of the sexual act. He believed that during intercourse the couple's souls come into contact with other worlds and create a new soul, and that pregnancy was a sacred state. Contrasting the two poles of Christianity, Bethlehem (childbirth) and Golgotha (death), Rozanov maintained that by concentrating on Golgotha, the Church has turned Christianity into a religion of suffering, sorrow and death. He wanted Christians to resurrect the spirit of Bethlehem and for Christianity itself to become phallic, 'at least in part'. Independently of Freud, he extolled a good sex life as essential to physical and mental health.

3 Christianity and Judaism

Around 1905-6 Rozanov went through a religious crisis. Soon after, he began to attack Christianity *per se* as a religion more suited to funerals than to weddings, a religion that teaches man *'to live for death and to die for life'*. No Christian conception of the family exists, he argued. Monasticism was the Christian ideal - denial of life and love, rejection of the world and the family, renunciation of pleasure of any kind for the sake of heaven. One cannot even imagine any of the apostles or their young wives in love. Only love of Jesus is allowed. Through love of 'the sweetest Jesus', the fruits of this world tasted bitter. The Gospels were a religiously cold, even religiously indifferent book, in which the stamp of sadness is ever present. Jesus never laughed, never sang, never danced, and did not marry. Christian monks and nuns were akin to the castrated priests of the Phoenician gods Moloch and Astarte. 'And this hard crystal [monasticism] is indissoluble in Christian civilization. Moreover, it is slowly leading the Christian peoples…and Christianity itself to disunion, destruction and to leaving behind on earth [only] the "chosen few"'. (see Roberts 1978: 194).

Rozanov expressed these ideas in 'On Sweetest Jesus and the Bitter Fruits of the World' (1907), published in *Tëmnyi lik. Metafizika khristianstva (Dark Face: The Metaphysics of Christianity)* (1911a), *Liudi lunnogo sveta. Metafizika khristianstva II (People of the Moonlight: The Metaphysics of Christianity II)* (1911b) and *Apokalypsis nashego vremeni (The Apocalypse of Our Times)* (1917-18).

Rozanov termed ascetics 'lunar types' who live outside the family and do not procreate. Some ascetics had a weak or non-existent sex drive, but most were repressed homosexuals. As examples, Rozanov gave Jesus, Plato, Solov'ëv, monks and nuns, career women, and secular radicals from 'that half Urning' (homosexual), Chernyshevskii to the present. Rozanov associated atheism and socialism with 'seedlessness', non-procreation. Homosexuals and lesbians were a 'third sex'. They have contributed greatly to society and culture and should not be persecuted. But Rozanov also claimed that because they have no children, they are indifferent to the future, including their country's future.

Rozanov admired the sex-positive teachings of Judaism, the strong family life of contemporary Jews, and Jewish survival in the face of centuries of persecution. But he found Jewish energy menacing, and attributed it to their sex-positive religion and to circumcision. He portrayed certain Jewish rituals in eerie, other-worldly terms and described Jews as spiders feeding off Russian blood and as destroyers of Russian culture. During the Beiliss Case (1911-13) - the government's frame-up of a Jew, Mendel Beiliss, for ritual murder - Rozanov falsely claimed that ritual sacrifice was and remains the most essential aspect of Judaism. Denying that he was exacerbating anti-Semitism in a land rife with pogroms, Rozanov declared that he wanted to move the case from politics to a higher 'religious' plane. Some of his writings were so scurrilous that even *Novoe vremia* refused to print them. Because of them Rozanov was expelled from the Religious-Philosophical Society.

In *Apokalypsis nashego vremeni*, Rozanov's response to the Bolshevik Revolution, he wrote that the Gospels have led humanity to a 'blind alley of castration and death' and called *Revelations* an anti-Christian book, because it was based on birth ('The Woman Clothed in the Sun'). He claimed that the masses have abandoned Christianity because it is impotent. 'Despite all the beauty of Christianity', it cannot provide bread. Christianity's dissolution has left 'huge voids' into which 'all humanity is falling'. Rozanov also criticized Russian literature, especially nihilism, Gogol' and himself, for causing Russians to lose sight of reality. And he apologized to the Jews for defaming them, lauded their positive role in history and in Russian society, and condemned pogroms.

Rozanov's diatribes against Christianity and Christ were motivated as much by love as by hate. His writings also contain innumerable positive statements about them. For example: 'only in the Church is it warm'; 'of course I will *nevertheless die in the Church*, of course *I need the Church incomparably more than literature*'; and 'I need only consolation, and therefore I need only Christ… Paganism and Judaism do not even come to mind' (see Roberts 1978: 304-10; original emphases). His writings constitute an extreme example of the revaluation of Christian dogma that was a feature of the Religious-Philosophical Renaissance.

Ruge, Arnold (1802-80)

Arnold Ruge was the most influential liberal writer and activist of the radical wing of Young Hegelianism. For him philosophy was a challenge to translate the humanist ideals of emancipation and self-determination into the realities of moral, cultural and political practice. As editor of powerful intellectual journals such as Hallesche und Deutsche Jahrbuecher (1838-43) with Theodor Echtermeyer, 'Anekdota zur neuesten deutschen Philosophie und Publizistik' (1843), 'Deutsch-Franzoesische Jahrbuecher' (1844) with Karl Marx, and 'Die Akademie' (1850), he became the leading promotor of liberal philosophy and civic emancipation in Germany. Ruge represented the citizens of Breslau in the Frankfurt Paulskirche parliament in 1848-9 and worked briefly with Alexandre Ledru-Rollin and Guizeppe Mazzini in establishing a short-lived 'European Democratic Committee' in London in 1849.

Ruge understood his critical educational, cultural and political activities as a direct calling from the heritage of European enlightenment and German idealism, thus transforming idealistic theory and vision into the realities of political practice and agitation. In this manner he promoted such radical figures as Bruno Bauer, Max Stirner, David Friedrich Strauss and Ludwig Feuerbach.

1 Philosophy and revolution

Arnold Ruge, born 9 September 1802 in Bergen on the German island of Rügen, died in 1880 in Brighton, England after thirty-one years of exile. One of the most influential and radical German liberal intellectuals and democrats, he had to take refuge first in Paris and London in 1843 where he worked with Karl Marx, and again after 1849 in London and Brighton. Ruge was a successor to the tradition of academic philosophy which runs from the Enlightenment through Kant, Fichte and Hegel. But Kant's concept of autonomy and Hegel's model of emancipation still were only theoretical and academic: 'Today we have to resolve not only the theoretical, but also the practical conflicts. Only the unity of free thought and free will, only the dissolution of the conflict between free thought and un-free mankind will result in the complete realisation of liberty' (Ruge 1852: 18). Times have changed: 'Our times are political, and politics work for the liberty of this world', he wrote in 1842 (1985 vol. 2: 254) in his influential critique of Kant's and Hegel's reluctance to address real practical matters of political change.

It is by free and reasoning people that the unconscious self-determination of humankind will be elevated to self-conscious self-determination. Only the free person is the true person; the realization of liberty lies in emancipation and humanization - that is, in humanism. Ruge held that the humanism of the future will translate traditional principles of existing and historic religions into the 'humanistic religion', determined to realize the 'essence of man through knowledge, beauty, and liberty'. Means to achieve these goals are 'a constitution of society rooted in self-determined development, free communities, schools and academies of the sciences and arts' resulting in a humanism which is characterized by 'true religious practice in ethics and the education of all humans to their true essence in equal, political, and economic community' (Ruge 1852: 26, 45).

2 Protestantism and romanticism

Contrary to Hegel's complex and consensus-oriented hermeneutical interpretation of dialectical processes in personal development and in the history of ideas and in world history, Ruge in 1842 identified only two conflicting forces in history as well as in personal development: Protestantism and romanticism. Protestantism is the progressive and evolutionary progress of political, cultural and personal development, a self-reforming and self-emancipating principle, 'free and autonomous as science which is an offspring of protestant reasoning'. Romanticism, the contradicting principle, dwells on emotions and sentiments, on 'inwardness' ('*Innerlichkeit*') which defines itself in antagonistic and dualistic terms against the outside world and its challenges (Ruge 1985 vol. 2: 128). Modern 'romantic inwardness' itself must be understood as a product of Protestant emancipation of individual conscience from heteronomous religious, metaphysical or political powers. In political terms, romanticism can easily be identified as the anti-emancipatory and reactionary force, and is politically represented by the suppressive and reactionary political powers on the European continent. While German Protestantism, in Ruge's assessment, does not live up to its calling and heritage any more as it has become a part of the reactionary powers of romanticism, the principle of Protestantism has already emigrated into liberal philosophy and radical

political theory. Ruge's conflict theory - influenced by Bruno Bauer's Manichean model of antithetical progress in philosophy and politics (see Bauer, B.) - becomes the blueprint for Marx's concept of ideational antithetics between materialism and idealism, and of political and economic antithetics between capitalism and proletarism. It marks the departure of radical and confrontational antithetical Hegelianism from the non-confrontational dialectical method of Hegel.

3 Religion of humanism

Ruge regards his political vision of a socialist and democratic republic of responsible and freely contracting individuals as the manifestation of free religion, the religion of humanism. In *Die Loge des Humanismus (The Lodge of Humanism)* (1852) and *Unser System (Our System)* (1850) he outlines his cultural, social and political programme of the religion of humanism as the logical consequence of the history of visions, ethics and economics. He holds that religious principles such as work-ethics and virtues, love and solidarity, altruism and mutual understanding have to be released from the bondage of established churches and religious sects in the same way as individuals have to be freed from the dominating powers of heteronomous tutelage by reactionary and elitist models of government. Not only individuals, but also the institutions of society must be driven by self-determination and self-emancipation.

Ruge calls for free education, free religious societies, academies for the arts and sciences, for free speech and free public opinion, and a free economic market within a socialist framework guided by a culture of work ethics, justice, solidarity and equality. But such a vision, in his understanding, does not exclude the 'organisation' of free institutions of learning, arts, and crafts, of a system of labour organisational and distribution by state authorities. Heine called Ruge the grim doorkeeper of Hegelian philosophy; to be a philosopher for Ruge meant not only to analyse the good and to argue for it but also to will it and to fight for it.

Rule of law (Rechtsstaat)

The 'rule of law' most simply expresses the idea that everyone is subject to the law, and should therefore obey it. Governments in particular are to obey law - to govern under, or in accordance with, law. The rule of law thus requires constitutional government, and constitutes a shield against tyranny or arbitrary rule: political rulers and their agents (police and so on) must exercise power under legal constraints, respecting accepted constitutional limits. The British and US conceptions of this ideal find a parallel in the Germanic concept of the Rechtsstaat, *or 'state*-under-*law', where the state as an organized entity is conceived to be limited by laws and by fundamental principles of legality, rather than being a purely political organization that can dispense with law in the interests of policy. Such concepts play an essential part in the political philosophy of liberalism; yet, characteristically, their more detailed exposition and indeed their nature and meaning are contested and controversial.*

In a wider sense, the rule of law articulates values of procedural fairness or due process which affect the form *of legal rules and govern the manner of their application. Those values both enhance the utility of legal regulation and also acknowledge underlying ideas of human dignity and autonomy. In a further sense, the rule of law refers to the faithful application of those rules and principles which constitute the law of a particular legal system. It expresses the idea that legal obligation should always be determined in particular cases by analysis of existing law - as opposed to* ad hoc *legislation by judges - even where disagreement may exist about the true meaning or content of the law.*

The connection between the rule of law and justice is complex. The rule of law cannot itself guarantee justice, but it forms an essential precondition. In so far as it imposes formal constraints on the laws enacted or enforced, which ensure that they are capable of being obeyed and that they are fairly administered, the rule of law assumes a conception of moral personality - of how individuals should be treated, as responsible human beings, capable of a sense of justice - which links the idea with the values of freedom and autonomy, and the ideal of equality.

1 Constitutionalism and the separation of powers

Constitutional government entails some form of separation of powers. Although the law may be changed by the exercise of political power, it may be altered only in compliance with established constitutional procedures; and all acts of government and public officials must respect the requirements of the law which apply at the time of acting. The legislative, executive and judicial powers of the state must not be simultaneously exercised by the same persons or the same institutions, without appropriate restraints. The independence of the judiciary is fundamental. Although various arrangements for the division of legislative and executive powers may suffice - the rule of law does not necessarily require complete institutional independence - the judicial power must be wholly distinct. Both government and legislature must act in accordance with the existing law - as ultimately interpreted by the judiciary - until it is altered by lawful (constitutional) means.

F.A. Hayek, however, defended a more rigorous interpretation. The law constituted a shield against arbitrary rule by virtue of its generality. If the political rulers were obliged to govern within the constraints of general laws, they could not single out particular persons for special treatment. John Locke also emphasized the importance of rule by general laws, as opposed to 'arbitrary decrees' tailored to the circumstances of particular cases.

Hayek objected that the rule of law had been undermined by the modern blurring of the legislative and executive functions. Every coercive act of government should be authorized by law in the sense of a 'universal rule of just conduct' - a general rule which was also abstract in the sense that it was not directed to the attainment of any specific policy objective or desirable set of circumstances. Hayek considered that the executive government should always respect the ordinary rules of private law, applicable to the actions of private citizens. The authorization by the legislature of particular acts of government which would otherwise be unlawful permitted the executive to escape the constraints of general laws. Acting as a representative assembly, whose majority is committed to the support of an administration or of schemes for the use of public resources, the modern legislature fulfils a primarily executive role in breach of the theory of separation of powers.

A.V. Dicey attributed similar importance to the subservience of government to the ordinary private law. In his analysis of the rule of law as a principle of British constitutional law, Dicey stressed the idea of equality, in the

sense of the equal subjection of everyone - public official as well as private citizen - to the civil and criminal law. The rule of law meant not only the absence of arbitrary or even discretionary governmental power, but also that constitutional law was the product of the courts' decisions in ordinary litigation involving public officials.

It is now widely considered that Dicey gave exaggerated emphasis to private law, at the expense of public law. It is not possible for government to accomplish necessary tasks of economic control and social administration without special powers conferred by, and subject to independent principles of, public law. None the less, Dicey's famous repudiation of 'administrative law' or *droit administratif* reflected the underlying rationale of the rule of law. Hayek distinguished between rules regulating the activities of governmental agencies, or regulations made by such agencies, on the one hand, and 'administrative powers over persons and property', on the other. The latter entailed the exercise of discretion and permitted discrimination between persons. The pursuit of 'social justice', if that involved treating the citizen and his property as objects of administration, was not compatible with a free society under the rule of law.

Constitutionalism means more than adherence to a purely formal concept of legality which satisfies the principle of separation of powers. If there were no limits on the nature and scope of government powers - because the laws permitted the exercise of unfettered discretion - there would be no safeguard against arbitrariness, and individual freedom would be constantly in peril. Hans Kelsen's 'pure' theory of law seems deficient in this respect (see Kelsen, H.). Kelsen identified the 'state' with the legal order, in the sense that the state was a 'personification' of the 'unity' of the legal order. Acts could be imputed to the state where they were performed by persons or institutions occupying certain superior positions within the hierarchy constituted by the legal order. The law of a state consisted of those norms whose validity could be logically derived from acts of will by the ultimate authority, which was itself empowered by the 'basic norm' necessarily presupposed by lawyer and 'legal scientist'. It was not necessary, then, that 'law' should have any particular content, provided only that it was enacted or laid down by the appropriate authority. In this minimal sense, every state is a *Rechtsstaat* - a state defined and regulated by law. It is apparent, however, that in this sense the rule of law has no value as a principle of constitutionalism, or safeguard of liberty. The contemporary German conception of *Rechtsstaat* postulates observance of fundamental principles of legality and proportionality, and respect for guaranteed constitutional rights expressing the inviolability of human dignity. Kelsen's formalism is largely rejected.

2 Justice and liberty

The special process-values which are closely associated with the rule of law, in its wider conception, were articulated by Lon Fuller. Fuller argued that the rule of law was the special virtue of law, in the sense that the existence of a legal system - as opposed to the exercise of unbridled power - involves compliance with the 'inner morality of law'. In addition to the requirement of generality - the exercise of power must be constrained by rules - the laws must be published so that the citizen can know their content. Obedience is possible, moreover, only if the laws are clear, and not contradictory. Legality is equally frustrated by laws requiring the impossible. Laws imposing strict liability for civil wrongs pose special problems; and strict criminal liability, whereby someone can be punished despite acting innocently and with due care, undermines the rule of law.

Laws should be prospective for similar reasons, although a retroactive statute might sometimes be needed as a curative measure to correct lapses in other requirements of the law's internal morality. The precept *nulla poena sine lege* expresses the widely shared condemnation of *ex post facto* criminal laws. There must also be reasonable constancy of law through time; and the actions of officials must conform to the rules declared. The rules of 'natural justice', or 'procedural due process', assist in achieving such congruence by ensuring that the law is correctly applied in particular instances.

Although Fuller asserted a connection between procedural legality and the moral quality of the law enforced, he failed to establish a necessary connection. Other writers have observed that legality is compatible with great iniquity because it places no limitations on the substantive content of law (see Legal positivism §1). It excludes certain sorts of arbitrary power, but fails to guarantee respect for human rights, civil liberties or social equality. The rule of law has been likened to a sharp knife - an efficient instrument for governance, but morally neutral between different purposes. In this respect, attempts to associate the rule of law with a wider vision of political liberty and social justice have been criticized for dissolving its discrete contribution to political theory in more diffuse and contentious philosophical claims.

A connection between the rule of law and the moral quality of law may, however, be made by paying closer attention to the underlying rationale of legality. Adherence to the rule of law acknowledges human dignity and autonomy by treating people as capable of using the law as a guide in determining their actions. Where the rule of law exists, citizens may take account of legal requirements in formulating their plans; and their powers of self-determination are not frustrated by the unpredictable exercise of political authority. John Finnis has observed that the rule of law recognizes the intrinsic importance of a certain quality of interaction between ruler and ruled, expressing values of reciprocity and procedural fairness whose preservation may often justify sacrifices in efficiency or other political ends (see Natural law §4).

Moreover, Fuller emphasized the likelihood of frequent conflict between the various canons of legality - there could be no utopia in which all the desiderata were always fully satisfied. The rule of law may therefore be thought to embrace an approach to the resolution of such conflicts, in any particular case, which itself respects the values of dignity and autonomy constituting its essential point. In this respect, the coherence of the 'inner morality' of law ultimately depends on considerations which cannot be regarded as wholly instrumental.

It is also mistaken to regard the rule of law merely as a fetter on the exercise of political power. The law does not serve merely to execute the will of political rulers, but to provide a stable framework within which each person may pursue their own ends while respecting a similar freedom in others. In this way, adherence to the rule of law serves to protect legitimate expectations, formed in reliance on private as well as public law and affording secure grounds for individual planning and independent action.

John Rawls has made a similar connection between justice and the rule of law. The regular and impartial administration of public rules - or 'justice as regularity' - is a necessary condition of a just scheme of social cooperation. The more perfectly a legal order fulfils the precepts of the rule of law, the more securely is liberty protected and the more effective is the organization of social conduct. The boundaries of our liberty are uncertain if laws are vague and imprecise, or the rules of natural justice are neglected. The principle of responsibility, whereby criminal liability should not exist in the absence of *mens rea*, also serves to protect individual liberty (Justice, equity and law; Law and morality).

3 Judicial obligation and legal decisions

The separation of powers assumes that judges are bound by existing law even when its application to particular cases presents questions of interpretation, whose proper resolution may be controversial. The ideal of the rule of law would seem to be seriously compromised if, in doubtful cases, judges were free to usurp the legislative function and create new law according to their own perceptions of justice or public policy.

Ronald Dworkin has offered a theory which seeks to explain the sense in which every judicial decision is determined by existing law, even in cases where good lawyers may reasonably disagree about what the law requires. The principle of separation of powers is reflected in Dworkin's distinction between principle and policy. Questions of policy are those which concern the public good or the general welfare, and they are primarily the province of government or legislature. Judicial decisions should be grounded mainly on principle, which concerns the scope and content of individual rights. When accepted rules do not clearly determine questions about legal rights, the judge must resort to analysis of underlying principle. He is bound by law in the sense that he must decide each case in accordance with the scheme of principle which best explains and justifies existing legal rules and practices. Since Dworkin supposes that, in any highly developed legal system, a sufficiently rigorous analysis would display good reasons of morality or consistency for judicial decision, even when the outcome may be controversial, he claims that there is in principle a correct answer to every question of law.

Argument about the requirements of the rule of law, in this further sense, focuses on the content of existing law, properly understood, rather than on more formal criteria which are independent of any particular legal system. Dworkin's account has the merit of showing the importance of the individual conscience in making judgments about the content of law. It is part of the idea of the rule of law that legal obligation is ultimately a matter of reason, and is therefore susceptible of understanding and intelligent obedience by every citizen. The identification of legal analysis with moral reasoning and political principle, however, makes the content of law closely dependent on controversial criteria of justice and fairness. It may be argued, none the less, that the values of autonomy and individual responsibility, which underlie formal accounts of the rule of law, assume precisely the

kind of independent moral judgment which Dworkin's theory makes central to legal analysis.

The concept of 'integrity', which expresses Dworkin's model of judicial reasoning, represents an accommodation between conflicting values of justice, concerning individual rights, and fairness, in the sense of the appropriate distribution of political power. Integrity requires that the law should reflect a consistent and coherent body of principles, in order that everyone is treated alike. The analysis therefore reveals the importance of equality as an ingredient of the rule of law. Dworkin shows that the formal equality which is ensured by the uniform and consistent application of legal rules - the least controversial feature of the rule of law - must be supplemented by a more thoroughgoing consistency of legal principle. The ideal of equality before the law ultimately assumes a substantive equality of legal protection for the rights and interests of every citizen.

Russell, Bertrand Arthur William (1872-1970)

Bertrand Russell divided his efforts between philosophy and political advocacy on behalf of a variety of radical causes. He did his most important philosophical work in logic and the philosophy of mathematics between 1900 and 1913, though later he also did important work in epistemology, metaphysics and the philosophy of mind, and continued to contribute to philosophy until the late 1950s. He wrote relatively little on ethics. His political work went on until his death.

In the philosophy of mathematics his position was logicism, the view that all of mathematics can be derived from logical premises, which he attempted to establish in detail by actual derivations, creating in the process what is essentially now the standard formulation of classical logic. Early in this work he discovered the self-referential paradoxes which posed the main difficulty for logicism and which he eventually overcame by the ramified theory of types.

Logic was central to Russell's philosophy from 1900 onwards, and much of his fertility and importance as a philosopher came from his application of the new logic to old problems. Among his most important logical innovations were the modern theory of relations and the theory of descriptions. The latter enabled him to reparse sentences containing the phrase 'the so-and-so' into a form in which the phrase did not appear. The importance of this theory for subsequent philosophy was that it enabled one to recast sentences which apparently committed one to the existence of the so-and-so into sentences in which no such commitment was suggested. This laid the basis for a new method in metaphysics (widely pursued by Russell and others in the first half of the century) in which theories about items of a given kind are reformulated so as to avoid reference to items of that kind.

Logicism itself offers just such a treatment of mathematics and in his later work Russell used the method repeatedly, though the reformulations he suggested were rarely so explicit as the ones he had offered in mathematics. In 1914 he proposed a solution to the problem of the external world by constructing matter out of sensibilia. After 1918 he proposed to construct both mind and matter out of events. After 1940 he treated all particulars as bundles of qualities. In each case his motivation was to avoid postulating anything that could be constructed, thereby eliminating ontological commitments which had no independent evidential support. Outside mathematics, his starting-point was the empirically given and he attempted to make his constructions depend as little as possible upon items not given in experience. He was not, however, a strict empiricist, since he did not think that empirical evidence alone would be sufficient for the constructions and he was always prepared to supplement it in order to obtain them. He wanted to construct, not those items which were empirically warranted, but those which were required by the relevant scientific theories, for he regarded science as the best available, though by no means an infallible, source of truth. The task, in each case, was therefore to reveal the least amount of apparatus that would have to be assumed in addition to the empirical data in order for the constructions required by science to be possible. This methodology, which he pursued throughout his career, gives an underlying unity to what, more superficially, appears as a series of abrupt changes of position.

1 Life

Russell was born into the Whig aristocracy and inherited many of the values of its most radical wing. His grandfather, a prominent Whig reformer of the 1830s, had twice been prime minister. Russell was orphaned before he was 4 and was brought up by his grandmother who had him educated at home. In 1890 he went to Trinity College, Cambridge, to study mathematics. He gained a first in mathematics in 1893 and then turned to philosophy for his fourth year.

In 1894 he married Alys Pearsall Smith and spent part of his honeymoon in Berlin working on his first book, *German Social Democracy* (1896). The following year he published *An Essay on the Foundations of Geometry*, a revised version of his dissertation for which he had been awarded a six-year fellowship at Trinity. This was the first of a projected series of books on the sciences. After some aborted work on physics, he turned to pure mathematics and logic, producing many of his most important contributions in the period to 1913. While doing so, he lived mainly off unearned income, but in 1910, his capital depleted, he took up a lectureship at Trinity where he taught until 1916.

Though Russell had been born with an interest in politics, it had not hitherto occupied much of his time (despite his study of the German Marxists and vigorous interventions on behalf of free trade and women’s suffrage). With the outbreak of war in 1914, however, his interest in philosophy lessened and he threw himself into writing, speaking and organizing on behalf of the pacifists. A conviction under the Defence of the Realm Act led to his dismissal from Trinity in 1916; a further conviction led to his being jailed in 1918. After 1916 he had only relatively short periods of academic employment and was dependent upon writing to make his living - a fact which only partially explains his huge subsequent output.

After the war he visited Russia to see the work of the Bolshevik government, but was disillusioned with its authoritarianism. In 1920-1 he spent a year at the University of Peking (Beijing). Returning to England he married Dora Black in 1921, just in time to legitimize his son; a daughter was born in 1923. Parenthood led him to take an interest in education and with his wife he started an experimental school. It was not, in Russell’s eyes, a success, and it was very expensive to run, requiring that he undertake regular lecture tours of the USA to raise money. His involvement with it ended, along with his marriage, in 1932, though Dora continued to run it on her own until 1943.

Through the 1920s and early 1930s Russell wrote prolifically on an astonishing range of topics, producing (among much else) books on Russia, China, relativity, history, education, sexual morality, international relations, religion and the future of society. Though much of this activity was necessary to make ends meet, Russell was a tireless advocate of progressive causes. By the mid-1930s, however, tiring of the precariousness of this way of life and needing now to support two families (he had remarried in 1936 and a third child was born in 1937), he hoped to return to academic life. This was not easy: positions were scarce and Russell was a controversial figure. In 1938 he lectured at Oxford, followed by visiting appointments at Chicago and UCLA and finally an offer of a permanent position at City College, New York. This last, however, provoked opposition from New York’s Catholic community and the appointment was overturned in a celebrated court case.

In 1940, therefore, Russell found himself unemployed and marooned in America by the war. At this point, the eccentric millionaire Albert Barnes came to his rescue with a five-year appointment to lecture on the history of philosophy at the Barnes Foundation in Philadelphia. Although Barnes fired Russell at the end of 1942, he permanently solved Russell’s financial problems, for not only did Russell collect a sizeable sum for breach of contract but the lectures he gave for Barnes became the basis for his hugely successful *History of Western Philosophy* (1945).

Russell returned to England in 1944 to take up a fellowship at Trinity College, where he completed his last great philosophical work, *Human Knowledge* (1948). His return marked not only a mending of his relations with Trinity but also with the British establishment. His continued condemnation of communism in general and the Soviet government in particular was well suited to the beginnings of the cold war and Russell enjoyed a period of unaccustomed respectability. Throughout the 1950s he continued to write prolifically, including a philosophical autobiography, *My Philosophical Development* (1959). He married for a fourth time in 1952.

His respectability was short-lived. After the death of Stalin his hatred of the Soviet government moderated, and the threat of nuclear war came to dominate his thoughts. He wrote extensively on the danger of war during the 1950s but increasingly felt the need for action and in 1958 helped found the Campaign for Nuclear Disarmament, and then the more militant Committee of 100. In 1961 he was jailed once more for inciting demonstrators to civil disobedience. The 1960s were a time of hectic political work for Russell. He lent support to many causes and was especially active in opposing the Vietnam War. His last political statement, on the Middle East, was written two days before his death.

2 Early work

As an undergraduate Russell came under the influence of the neo-Hegelianism which then dominated British philosophy, especially the work of J.M.E. McTaggart, James Ward and F.H. Bradley. His earliest logical views were influenced most by Bradley, especially Bradley’s rejection of psychologism. But, like Ward and McTaggart, he rejected Bradley’s metaphysical monism in favour of monadism. Even as an idealist, he held that scientific knowledge was the best available and that philosophy should be built around it. Through many subsequent changes, this belief about science and his pluralism remained constant.

In 1895 he conceived the Hegelian plan of writing an encyclopedia of the sciences, together with another series of books on social and political issues, the two to be united in a synthesis of theory and practice. He followed this plan long after its Hegelian inspiration had passed, and in old age he noted that he had written as much of both series as could have been expected - except for the final synthesis, which still eluded him. As a system, the encyclopedia was to be dialectical, with supercessions between the individual sciences. Within each science, however, transcendental arguments were used to establish its a priori elements. In *An Essay on the Foundations of Geometry*, for example, he attempted to show that projective geometry was a necessary condition for the possibility of external experience. At the same time, he argued that geometry gave rise to contradictions which could only be resolved by a supercession to kinematics. From geometry he turned to arithmetic (which preceded it in the dialectic) and to physics (which followed it), though what he wrote on these subjects remained largely unfinished (see 1983-: vol. 2).

Two main problems caused Russell to abandon this work. First, there was (as G.E. Moore pointed out) a lingering psychologism associated with his use of transcendental arguments. Second, the contradictions which supposedly arose in the special sciences generally were not eliminated by the transition to a new science, but merely reappeared in a new form. They resulted from the use of asymmetrical relations, but only if these relations were treated as internal. Russell resolved both problems in 1898 by abandoning idealism (including internal relations and his Kantian methodology). He called this the one real revolution in his philosophy (see Hegelianism §5; Transcendental arguments).

3 Logicism

The new philosophy was little help with Russell's immediate task - an analysis of the concept of number - until, in 1900, he discovered Peano's symbolic logic. Significantly, Russell's first contribution to Peano's logic was a formal theory of relations on the basis of which he was able to define the cardinal number of a class u as the class of classes coextensive with u and produce a theory of progressions which formed the basis for ordinal arithmetic (1901).

Using the new logic Russell propounded logicism, the view that the whole of pure mathematics can be derived deductively from logical principles, a position he arrived at independently of Frege, who held a similar but more restricted view (and who had anticipated Russell's definition of cardinals in 1884) but whose work Russell discovered only later (see Frege, G. §8). Russell's first full statement of logicism was published in *The Principles of Mathematics* (1903). The interest of this work is mainly philosophical: it contains none of the actual derivations of mathematical results from logical principles. The latter was to be carried out in a projected second volume to be written in collaboration with A.N. Whitehead (see A.N. Whitehead §2). Their work expanded over the next ten years and resulted in the three-volume *Principia Mathematica* (1910-13), in which detailed derivations were given for Cantor's set theory, finite and transfinite arithmetic (including an elegant generalization of ordinal arithmetic called 'relation-arithmetic') and elementary parts of measure theory (see Cantor, G.). A fourth volume, by Whitehead alone, on geometry (including complex number theory) was never completed. As a demonstration of logicism, therefore, *Principia* depends upon much prior arithmetization of mathematics, for example, of analysis, which is not explicitly treated. Even with these allowances much is still left out, such as abstract algebra and statistics (see Numbers §6).

4 Absolute realism

The philosophy which Russell had adopted after abandoning idealism in 1898 and which underlay his early logicism was an extreme realism (to which Moore also subscribed). It was fully stated in *The Principles of Mathematics* and had been anticipated in *A Critical Exposition of the Philosophy of Leibniz* (1900) and in unpublished writings (see 1983-: vol. 2).

In Russell's absolute realism, everything which can be referred to or made the subject of a proposition is a term which has being (though not necessarily existence). Terms are either things, which can occur in a proposition only as its subject(s), or concepts, which may occur as subjects but which may also occur as relations. A proposition is a complex of terms related to each other. All complexes are propositions; all propositions are terms. Terms are neither linguistic nor psychological, but objective constituents of the world. The first task of philosophy is the theoretical analysis of propositions into their constituents. The propositions of logic are unique in that they remain

true when any of their terms (apart from logical constants) is replaced by *any* other term.

In 1901 Russell discovered that this position fell prey to self-referential paradoxes. For example, if the combination of any number of terms is a new term, the combination of *all* terms is a term distinct from any term. This paradox is related to the greatest cardinal paradox which arose in Cantor's transfinite arithmetic. Cantor had shown that the power-set, $\wp(S)$, of any set *S* has a higher cardinality than *S*. But if *S* is the set of all cardinals, the cardinality of $\wp(S)$ will then be a cardinal greater than any in *S*. While thinking about this problem Russell came upon an even more troubling contradiction, now known as Russell's paradox, which affected the foundations of set theory itself. It seems natural to suppose that some sets are, but most sets are not, members of themselves. If we consider, however, the set of all sets that are not members of themselves and ask whether this set is a member of itself we arrive at Russell's paradox. For supposing that it is a member of itself, then it lacks the defining property of the set and so is not a member of itself. But if it is not a member of itself then it has the defining property of the set and so is a member of itself. The paradox is simply proven given the unrestricted comprehension axiom of naive set theory, that for any property (or propositional function) ϕ there is a set $\{x\colon \phi x\}$ of just those things that satisfy ϕ; that is to say, $a \in \{x\colon \phi x\} \equiv \phi a$. Let ϕx be $\sim(x \in x)$ and let *a* be $\{x\colon \sim(x \in x)\}$, then substituting in the comprehension axiom gives:

$$\{x\colon \sim(x \in x)\} \in \{x\colon \sim(x \in x)\} \equiv \sim\big(\{x\colon \sim(x \in x)\} \in \{x\colon \sim(x \in x)\}\big).$$

These paradoxes in set theory are related to other self-referential paradoxes. The best-known is the liar paradox, generated by the person who says 'I am lying': if what they say is true, it is a lie; if it is a lie then they speak the truth. The long delay in the publication of *Principia* was largely due to the difficulty of devising a logic which was both paradox-free and strong enough to support pure mathematics (see Paradoxes of set and property §4; Cantor's theorem; Continuum hypothesis).

5 Solutions to the paradoxes: the zig-zag theory

In *The Principles of Mathematics* Russell offered no firm solution to the paradoxes, but in the next few years he tried a variety of approaches. The first was what he called the 'zig-zag theory'. The intuitive idea behind it was simple: only 'fairly simple' propositional functions determine classes; 'complicated and recondite' functions do not (1906a: 145-6). The problem was to specify the degree of complexity which marked the divide. Russell's only published remarks on the theory were in a survey article written after he had abandoned the theory and are vague on this point (1906a). Unpublished writings reveal that he tried a number of formulations (1983-: vol. 4). The chief difficulty is to find an appropriately restricted comprehension axiom: versions with weak constraints permit new contradictions to be derived, but if the constraints are too strong, logicism (for example, Russell's definition of cardinal number) is undermined. Russell found no way of showing that a comprehension axiom strong enough to support logicism would be paradox-free.

The zig-zag approach has some affinity to Quine's 'New Foundations' theory (Quine 1937) and some more recent type-free theories (Feferman 1984), but the former imposes quite different constraints on comprehension, while the latter is inconsistent with logicism.

6 Solutions to the paradoxes: the substitutional theory

Russell's next attempt went considerably further. It occupied him from 1905 to 1906 and started from the theory of incomplete symbols he had devised in 1905 (see §9 below). Under the substitutional theory Russell eliminated classes, relations and predicates as terms over which variables ranged. Variables now range over entities, which are either simple individuals or complexes (including propositions). The fundamental notion of the theory is that of substituting one entity for another in a complex to yield a new complex. This is written '$p\frac{b}{a}!q$' and read '*p* with *b* substituted for *a* yields *q*', where *p* and *q* need not be propositions, though in the interesting cases they will be. '$p\frac{b}{a}!q$' will always be true or false whatever *p*, *a* and *b* are. If *a* does not occur in *p* then $p\frac{b}{a}!p$. Propositional functions and classes of individuals are expressed by matrices, for example, 'p/a', in which *p* is called the prototype and *a* the argument. *b* is a member of the class represented by 'p/a', if $p\frac{b}{a}!q$ and *q* is true. Propositional functions of propositional functions (or classes of classes) are expressed by the matrix '$q/(p/a)$'. Russell hoped to avoid the paradoxes because the application of a matrix to itself, which generates many of them, is impossible in the system. For example,

$$p\frac{p/a}{a}$$

is ill-formed, because ‘ p/a’ is an incomplete expression, not the name of an entity, and thus there is nothing which is substituted for *a*. Thus one can express with matrices everything that could previously be expressed by means of classes or functions except, as Russell puts it, for ‘certain limiting cases…[which] are precisely those that lead to contradictions’ (1906b: 171-2).

The ability to capture an iterative concept of classes by substitutional means preserved Russell’s definition of cardinal number and thus permitted the logicist programme to proceed. Russell spent much of 1906 developing logicism on a substitutional basis (see 1983-: vol. 5). The above account illustrates the lengths he was prepared to go to in order to preserve the unrestricted variables of the *Principles*. However, the fact that the theory allowed propositions as substituends permitted a propositional paradox to be derived. After several attempts to eliminate it and finding that, each time, it returned in more complicated forms, Russell reluctantly abandoned the substitutional theory.

7 Solutions to the paradoxes: the theory of types

In 1906 Russell adopted the solution which appears in *Principia*, namely the theory of types which banned self-reference by stratifying terms and expressions into complex hierarchies of disjoint sub-classes. The expression ‘all terms’, for example, is then meaningless unless restricted to terms of specified type(s), and a combination of terms of a given type is a term of different type; functions are of a different type to their arguments; classes of a different type to their members.

Ironically, a simple version of the theory had appeared in *The Principles of Mathematics* (appendix B). There, propositional functions are assigned a range of significance, ‘a range within which *x* must lie if $\phi(x)$ is to be a proposition at all’ (1903: 525). Significance ranges form types in that ‘if *x* belongs to the range of significance of $\phi(x)$, there is a class of objects, the *type* of *x*, all of which must belong to the range of significance of $\phi(x)$’ (1903: 525). Every significance range either is a type or is the union of several types. Types are hierarchically arranged: individuals constitute the lowest type, classes of individuals the next, classes of classes of individuals the next after that, and so on. Two-place relations (in extension) form a different hierarchy, three-place relations yet another, and so on. The theory bears resemblance to Chwistek’s simple type theory (Chwistek 1921), though there are important differences, notably that in Russell’s theory all ranges form a type, and propositions and numbers form distinct types outside the hierarchy. Since propositions are not stratified into types, Russell’s theory yields a propositional version of the contradiction (1903: 527).

Russell anticipated that the type theory of the *Principles* would have to be ‘transformed into some subtler shape before it can answer all difficulties’ (1903: 523). One reason he did not pursue this immediately was due to his reluctance to abandon the unrestricted variables of the *Principles* upon which his account of logic depended (see Urquhart 1989). Only when other avenues had been explored did he return to type theory. In the type theory of the *Principles* the type of a function had been determined exclusively by the type(s) of its argument(s). The ‘subtler shape’ of the theory Russell developed after 1906 - the ‘ramified theory of types’ - was obtained by adding order distinctions within each type based upon the form of the function. In a controversy with Poincaré, Russell had acknowledged that all the paradoxes involved violations of the ‘vicious circle principle’: No totality can contain members defined in terms of itself; or, in the formulation Russell preferred, ‘whatever involves an apparent [bound] variable must not be among the possible values of that variable’ (1906c: 198). The ramified theory of types was designed to build order-restrictions into the bound variables themselves in such a way that violations of the vicious circle principle would be prevented by the symbolism itself.

Functions are significant only when their arguments for each argument-place are drawn from a specified range of items appropriate to that place. Russell expresses this by saying that a function presupposes a totality for each of its argument-places; such a totality is the significance range for that argument-place. As before, individuals constitute the lowest such totality. First-order functions take only individuals as arguments; second-order functions take either first-order functions or individuals as arguments; third-order functions take either second-order functions, first-order functions or individuals as arguments; and so on. All the arguments of any function must be of a lower order than that of the function. If an *n*th-order function has an argument of order $n-1$, the function is

said to be *predicative*. Non-predicative functions all involve quantification over functions of lower order. (For example, if Russell is an individual, ‘Russell is clever’ employs a first-order predicative function of individuals, whereas ‘Russell has all the (first-order) qualities of a great philosopher’ employs a non-predicative function of second-order involving the quantification $(\phi)(x \text{ is a great philosopher } \supset \phi x)$, where the variable ϕ ranges over the totality of first-order functions. All bound variables range over only one such totality.)

Propositions form a similar hierarchy: *elementary* propositions have only individuals as terms; first-order propositions are either elementary or involve quantification over individuals; second-order propositions involve quantification over first-order propositions; and so on. First-order propositions presuppose no totality except that of individuals and, in general, propositions of *n*th-order presuppose totalities only of propositions of order $n-1$. The hierarchy of propositions can be derived from the hierarchy of functions since a proposition involving a totality of *n*th-order propositions can be reduced to one involving a totality of *n*th-order functions. Observing the restrictions imposed by these hierarchies ensures that no violations of the vicious circle principle can occur. The liar paradox is avoided, for instance, because what the liar asserts is ‘(*p*)(I affirm *p* and *p* is false)’. For this to be significant the bound variable ‘*p*’ must range over propositions of some specified order, while the proposition the liar asserts will be of a higher order and thus not among the propositions the liar asserts to be false.

In 1908, Russell sketched the development of logic and set theory up to the definition of cardinal and ordinal numbers on the basis of the ramified theory, a process that is completed in *Principia*. There are some differences between the 1908 presentation followed above and that in *Principia*: for instance, in *Principia* elementary propositions are not included among first-order propositions and propositional quantification is avoided. This is related to a more important change, namely Russell’s treatment of propositions in *Principia* as incomplete symbols (see §10) which requires a radical distinction between elementary propositions and those involving first-order quantification and is the basis for his claim that the propositional hierarchy is derived from the functional one. Some elements of the substitutional theory survive into ramified type theory, indeed Landini (1993) goes so far as to call the 1908 version a ‘modification’ of the substitutional theory. As in the substitutional theory, classes remain incomplete symbols, and Russell presents the hierarchy of functions in explicitly substitutional terms (see Theory of types).

8 Problems with ramified types

Russell’s reluctance to embrace the ramified theory of types was well-motivated, for it raised serious obstacles to logicism. In the first place, Russell’s definition of a cardinal number as the class of all similar classes is no longer admissible. There is no longer a class of all similar classes, but only a class of all similar first-order classes, a class of all similar second-order classes, and so on. (Strictly, of course, the definition will proceed in terms of the hierarchy of functions, but the class terminology is more familiar and admissible as a *façon de parler*.) There then ceases to be a unique cardinal 2, for example, but a different 2 at each level of the hierarchy; ordinary talk about 2 is typically ambiguous between these different cardinals. Similar problems affect the statement of logical principles which, strictly, would need to be stated for each order. In *Principia* this is avoided by the use of free variables which are typically ambiguous. Thus $\vdash . \ \phi x \vee \sim\!\phi x$ asserts the law of excluded middle for monadic propositions of undetermined order; whereas $\vdash .(\phi).\phi x \vee \sim\!\phi x$ asserts it for those of some particular order. These results are untoward but not intolerable.

A similar, but more troubling difficulty threatened Russell’s treatment of the continuum, for on the ramified theory the least upper bound of a bounded set of real numbers is a number of a higher level. The most serious difficulty, however, concerns the principle of mathematical induction: namely, that any function satisfied by 0, and satisfied by $x+1$ if satisfied by *x*, is satisfied by all natural numbers. These two difficulties threaten the logicist programme for transfinite and finite arithmetic respectively. Russell surmounted them by making the assumption that for every nonpredicative function there is an equivalent predicative function in the same variables. This is his ‘axiom of reducibility’: $(\exists f)(\phi x \equiv_x f!x)$ (1910-13: *12.1).

It has often been objected that the axiom of reducibility undoes all the good that ramifying type theory achieved, on the grounds that it renders the ramified theory equivalent to the simple theory, thereby readmitting all the paradoxes ramification was designed to prevent (Ramsey 1925; Copi 1950). Myhill (1979) shows that this objection is ill-founded.

Frank Ramsey (1925) proposed that the paradoxes should be divided into those which belong to logic and set theory and those which are semantical or linguistic and that logic need solve only the former. Since the simple theory of types solves the logical paradoxes, the ramified theory is not needed in logic. This suggestion has been very influential. However, it still leaves the semantic paradoxes to be dealt with and Ramsey's demarcation between the two kinds is hardly adequate. His suggestion that the semantic paradoxes are in some way empirical is neither clear nor plausible. Moreover, the fact that both types of paradox arise from self-reference suggests a uniform treatment. Above all, Ramsey's distinction does little justice to Russell's appealing intuition that the same underlying logic should be applied universally. It is clear now that semantics is capable of just as rigorous, formal treatment as set theory and the suggestion that the proper formal treatment of each requires different logical principles lacks *prima facie* plausibility (see Semantic paradoxes and theories of truth §2).

Under the influence of Wittgenstein, Russell came to accept the view that logical propositions were all tautologies. From this point of view the axiom of reducibility is clearly unsatisfactory (Wittgenstein 1922). From much the same point of view, Ramsey argued that it was not only contingent but a contingent falsehood - though it is not clear that his counterexample is a good one (Ramsey 1925). In the second edition of *Principia*, therefore, Russell tried to dispense with the axiom. He conceded that much of transfinite arithmetic would be lost as a result, but hoped none the less to save the theory of natural numbers by proving a version of the principle of mathematical induction within the constraints of the ramified theory and without the axiom of reducibility. Gödel (1944) noted the flaw in the proof and Myhill (1974) has since shown it to be irremediable. It follows, therefore, that even finite arithmetic cannot be logicized within the constraints of the ramified theory without the axiom of reducibility.

9 The theory of incomplete symbols

Both the substitutional theory and ramified type theory were closely linked to one of Russell's most important contributions to logic: his theory of definite descriptions and the more general theory of incomplete symbols it presaged. The theory of descriptions arose out of problems in Russell's theory of denoting in *The Principles of Mathematics*. It is plain that 'I met Quine' and 'I met the author of *Quiddities*' are different propositions, even though Quine is the author of *Quiddities*. In the *Principles*, the first proposition contains Quine, while the second contains a 'denoting concept' (expressed by the definite description 'the author of *Quiddities*') which denotes Quine. When Quine occurs in a proposition the proposition is about Quine, but when a denoting concept occurs the proposition is not about the concept but what the concept denotes. This theory, if it is to be statable, requires that there be some way in which a denoting concept, rather than its denotation, can be denoted. After much effort, Russell in 'On Denoting' (1905) concluded that this was impossible and eliminated denoting concepts as intermediaries between denoting phrases and their denotations by means of his theory of descriptions.

Russell showed in a broad (though not comprehensive) range of cases how denoting phrases could be eliminated in favour of predicates and quantified variables by providing an analysis of the sentence in which they occurred. This advance was made possible by Russell's study of Frege, whose theory of quantification replaced the intricate but unavailing theory of the *Principles*. Russell analysed sentences containing definite descriptions, such as, 'The successor of 1 is even', thus:

(1) $(\exists x)(x \text{ succeeds } 1 \;\&\; (y)(y \text{ succeeds } 1 \;\supset y = x) \;\&\; x \text{ is even})$

The three conjuncts in this analysis ensure, respectively, that a successor of 1 exists, that there is at most one successor of 1 and that whatever succeeds 1 is even.

In cases where the definite description does not denote, the sentence gets the value *false* on account of the falsity of the first conjunct of its analysis. This enabled Russell to treat as meaningful sentences containing non-denoting definite descriptions without having to suppose either that nonexistent objects were denoted (as in Meinong's theory of objects) or that there were such things as denoting concepts (as in Russell's 1903 theory) or Fregean senses. The subsequent literature has emphasized the first point, but it was the second which motivated Russell.

Some counterintuitive consequences of Russell's analysis were removed by his introduction of scope distinctions among the occurrences of descriptions within sentences. Not all problems are thus removed, however, and there have been many subsequent attempts to do better either through improvements to Russell's theory, or through 'free logics', or by means of Meinongian theories which permit quantification over nonexistent objects.

Obviously the theory will not permit the use of definite descriptions as substitution-values for the variables in (1) and this leads to a sharp distinction in Russell's philosophy of language between definite descriptions and names. Since Russell thought that most ordinary names were in fact disguised definite descriptions, he distinguished between descriptions and 'logically proper names' which alone could be substituted for variables. (The latter were names of objects of acquaintance - represented in ordinary language by 'this' and 'that'.) By treating ordinary names as descriptions he could use the theory of descriptions to account for the informative nature of identity statements such as 'Hesperus = Phosphorus'.

The principle of contextual definition employed in the theory of descriptions, which allowed sentences containing a description to be reparsed to eliminate the description, led Russell, after 1905, to make a sharp distinction between the grammatical and the logical form of a proposition. He applied similar techniques to other kinds of expression (for instance, to class names and to propositions). Russell held that the expressions thus eliminated, which he called 'incomplete symbols', had meaning only in the context of a sentence and were meaningless in isolation. The various ways in which they were eliminated constituted his 'theory of incomplete symbols' (see Descriptions; Existence §2; Free logics §§1, 3; Proper names §4; Sense and reference; Strawson, P.F. §2).

10 Theories of truth and judgment

The theory of incomplete symbols made possible Russell's substitutional theory, in which class names and relations were treated as incomplete symbols. The appearance of a propositional paradox in the substitutional theory convinced Russell that propositions should also be treated as incomplete symbols. This was accomplished by his multiple relation theory of judgment which became part of the philosophical underpinnings of ramified type theory. In Russell's early realism, true and false propositions alike were treated as subsistent complexes and belief as a relation between a mind and a proposition. This leaves it obscure why we prefer to believe true propositions. In the multiple relation theory, belief and other 'propositional' attitudes were treated as many-place ('multiple') relations between a mind and the individual constituents of the erstwhile proposition. Thus '*m* believes that aRb' has the form '$B(m, a, R, b)$', not '$B(m, p)$'. Apparent references to propositions are eliminated by subsuming their constituents within an actual psychological complex including a mind and related by some 'propositional' attitude. Propositions thus become fabrications of the mind. The belief represented by '$B(m, a, R, b)$' will be a true belief just in case there is a complex a-R-b.

Russell had considered such a theory as early as 1906, but put it aside while he worked on the substitutional theory in which propositions were needed as entities. The theory was taken up again and developed in writings from 1910 to 1913. The final development of the theory, in *Theory of Knowledge* (1913), was left unpublished by Russell because of criticisms from Wittgenstein, then his student at Cambridge. Wittgenstein's criticisms are perhaps most simply expressed as a dilemma. Either the constituents of a belief (*a*, *R* and *b* in the example above) are assigned to types or they are not. If they are not, then the 'propositions' fabricated by thought will not be subject to the ramified type hierarchy (it will be possible to judge nonsense, as Wittgenstein puts it) and the paradoxes will reappear. If they are, then they must be assigned to types by some prior judgment, to which the same considerations apply, and an infinite regress results (Sommerville 1981; Griffin 1985).

11 Logical atomism

Russell used the name 'logical atomism' for all his philosophical work after 1898, though now it is used mainly to describe his position from 1905 to 1919. The philosophy was atomistic because it took items in certain categories to be basic; it was logical because it sought to construct items in other categories by rigorous logical means. This involved a two-fold process: an analysis of concepts in ordinary or scientific use to discover which items were basic, followed by a logical reconstruction of the science from the basic items up. Although Russell's early logicist constructions were clearly along these lines, this analytic methodology came fully into its own only with the advent of the theory of incomplete symbols in 1905.

One important consequence of the theory of incomplete symbols was that the ontological commitments of a theory could be reduced by reformulating the theory to remove expressions which apparently denoted problematic entities. It was unnecessary to posit the existence of items which could be logically constructed. This formed the basis for what Russell called the 'supreme maxim in scientific philosophizing', his version of Ockham's razor: 'Wherever possible, logical constructions are to be substituted for inferred entities' (1983-: vol. 8, 11).

Parallel results held in epistemology. The theory of incomplete symbols showed how knowledge of a wide range of items could be achieved by knowledge (by acquaintance) of a much narrower range. Acquaintance was a direct, two-place cognitive relation, and objects of acquaintance were epistemically basic. Knowledge of other items was obtained by description, which always depended upon knowledge by acquaintance (1911). The distinction between knowledge by acquaintance and knowledge by description first appeared in 'On Denoting', where Russell first formulated his 'principle of acquaintance': 'in every proposition that we can apprehend…all the constituents are really entities with which we have immediate acquaintance' (1983-: vol. 4, 427). All other apparent constituents were to be eliminated by analysis. These innovations in 1905 marked the end of Russell's extreme realism, though he remained a Platonist in that he included universals among the objects of acquaintance (see Knowledge by acquaintance and description; Logical atomism §2; Ontological commitment).

12 Our knowledge of the external world

Russell has traditionally been regarded as the direct heir of the British empiricists, yet his work prior to 1910 belongs more naturally to the continental rationalist tradition. None of the thinkers who influenced him during this period - Kant, Bradley, Cantor, Peano, Frege - were empiricists, and it was not until 1912, when he was commissioned to write a short introduction to philosophy, *The Problems of Philosophy*, that he undertook a serious study of the British empiricists, especially Berkeley and Hume. Hume's influence appears directly in the chapter on induction (and in a paper of 1912, 'On the Notion of Cause'); Berkeley's was more indirect (since Russell rejected his idealism) and appears in Russell's treatment of the external world.

In *Problems* Russell held that empirical knowledge is based on direct acquaintance with sense-data and that matter itself, of which we have only knowledge by description, is postulated as the best explanation of sense-data. He soon became dissatisfied with this idea and, inspired by his logicist constructions of mathematical concepts, proposed instead that matter be logically constructed out of sense-data, thereby obviating dubious inferences to material objects as the causes of sensations. The actual data of sense, however, are too fragmentary for the construction of items with the expected properties of matter (such as permanence). To solve this problem Russell was led to postulate unsensed sensibilia in addition to sense-data. It is important to realize that for Russell, unlike most sense-datum theorists, sense-data were physical, located in physical space at varying distances from the place at which common sense located the material object. It is thus logically, though not practically, possible for more than one mind to be acquainted with the same sense-datum at the same time. Sense-data are merely sensibilia with which a mind happens to be acquainted, so properly speaking matter is constructed out of sensibilia rather than sense-data. In addition to matter, Russell also sought to construct space and time. All the sense-data with which a single mind is acquainted are located within a perspective, a private space peculiar to that mind. Similar spaces exist at every point at which a mind could be located. These private spaces Russell calls perspectives. Physical space is the set of all such perspectives. The arrangement of perspectives in physical space is achieved by the variation in the qualities of the sensibilia (such as their size and shape) as they appear in the perspectives: for instance, if the sensibilia in perspectives P_1 and P_2 are more similar than those in perspectives P_3 and P_4, P_1 and P_2 will be located closer together in physical space than P_3 and P_4.

This theory received its fullest expression in *Our Knowledge of the External World* (1914), though it remained in programmatic form; detailed constructions along similar lines were undertaken by Carnap (1928) (see Carnap, R. §1). Although Russell hoped that eventually a correlation between sense-data and the differential equations of physics would be forthcoming, it is difficult to see how this would ever be possible. Many of the standard objections to sense-data do not apply to Russell's theory, but it is still difficult to see how the gap between experiential evidence and physical theory could be bridged in the deductively rigorous way Russell wanted. For example, it is difficult to see how perspectives could be uniquely arranged in physical space when no sensibile occurs in more than one perspective. Nor is it clear how sensibilia could be grouped together to form the material objects required by either common sense or physics. Moreover, since sensibilia are physical and objective it would seem that they are still subject to misapprehension by the mind, thereby reintroducing the difficulties with illusion which had allegedly made material objects unviable as objects of acquaintance (see Perception, epistemic issues in).

13 Neutral monism

Before 1919 Russell wrote little about the philosophy of mind, though his dualism was evident in his analyses of judgment and acquaintance. By 1919, however, he came to think that mind, like matter, should be constructed out of more primitive material, a view akin to James's neutral monism (see James, W.). This change is somewhat puzzling, since Russell had criticized James's theory in some detail in *Theory of Knowledge* (1913) and, more tentatively, in 'The Philosophy of Logical Atomism' (1918). He was influenced partly by Hume's arguments for the unintrospectability of the self, but most importantly by Wittgenstein's treatment of belief, which 'shows…that there is no such thing as the soul' (Wittgenstein 1922: 5.5421).

Russell's neutral monism began with a new theory of belief in 'On Propositions' (1919a). He identified the contents of beliefs with images ('image-propositions') and words ('word-propositions'), understood as certain sorts of events - now the basic elements of his construction - which are neutral in the sense of being neither physical nor mental. Truth was analysed in terms of resemblance and causal relations. Wider issues are treated in *The Analysis of Mind* (1921), where the influence of contemporary trends in psychology, especially behaviourism, is evident. He never fully embraced behaviourism (for example, he did not attempt a behaviourist elimination of images), but he was prepared to push it as far as he thought it would go. He offered, for example, a behaviourist account of desire, about which he subsequently had doubts.

On Russell's neutral monism, minds and matter are constructed out of events and differ only in that they are organized by different causal laws: material objects by those of physics, minds by 'mnemic' causal laws, in which a past state of the mind is among the proximate causes of its current state. The theory is a precursor of later mind-brain identity theories.

In 1927, Russell returned to the problem of matter - this time, paying more attention to contemporary physics. Part I of *The Analysis of Matter* is devoted to relativity and quantum theory, and Part III deals with the causal and spatiotemporal order of events. In Part II, starting from a causal theory of perception, Russell asks what can be inferred from percepts (considered as events occurring within one's head) about the nature of their supposed external causes. Using the dictum that like causes have like effects, Russell answers that we can infer only the structure of the external world from the structure of our percepts - a doctrine known as structural realism.

Russell quickly abandoned structural realism when M.H.A. Newman (1928) showed that any set with the right cardinality could be arranged so as to have the same structure as the world - a result analogous to that claimed in Putnam's model-theoretic argument against realist theories of reference (Demopoulos and Friedman 1989). Russell, however, never abandoned neutral monism, though he left the theory incomplete. Constructions were suggested rather than provided (the fullest sketches offered were the treatment of belief in the second edition of *Principia* (1925) and a 1936 paper on temporal order). Moreover, while Russell had much to say about consciousness, he said very little about intentionality and (more surprisingly) personal identity. On the physics side, the breakdown of causality in quantum theory was a serious problem, given the importance Russell attached to causal relations in his constructions, but in 1927 it was perhaps not yet so well-established a fact as to demand explanation (see Neutral monism).

14 Later epistemology

Russell's penchant for reductive analysis was taken further in *An Inquiry into Meaning and Truth* (1940) where the terms of atomic facts, hitherto sense-data or events, are construed as bundles of compresent qualities. These qualities are the meanings of object-words, and bundles of them are denoted by logically proper names. This position was retained in *Human Knowledge* (1948); it marks the culmination of Russell's long battle with substance/attribute metaphysics. Despite its title, the *Inquiry* was more concerned with metaphysics and epistemology than with semantics. The meaning theory proposed there was causal and (in inspiration) behaviourist, though once again Russell did not expect a purely behaviourist analysis to be adequate.

Russell's allegiance to empiricism, like behaviourism, was never very strong and by 1936 he was writing on 'The Limits of Empiricism'. Even in *The Analysis of Matter* there are clear indications that he thought pure empiricism would render science impossible. In the *Analysis* he thought that Berkeleyan scepticism about matter could be avoided by construction, but that Hume's scepticism about induction was so far untouched. He tackled induction most thoroughly in *Human Knowledge* (1948), which contains his only extended treatment of probability. The problem for this book was set in 'The Limits of Empiricism', where he asked what non-empirical principles must

be assumed in order for science to be possible. Originally, he thought that induction itself would be sufficient. In *Human Knowledge*, however, he showed that inductive inference was not always truth-preserving (for reasons later popularized by Nelson Goodman as ‘the new riddle of induction’) (see Induction, epistemic issues in §1).

In place of induction, he proposed five ‘postulates of non-demonstrative inference’ as the minimum extra-logical, non-empirical apparatus required for science. His methodology here returned to that which had guided his work on *Principia* where he had sought the minimum logical apparatus necessary to support mathematics. It even had some resemblance to his earlier Kantian methodology, though Russell pointed out that he proposed his postulates as scientific hypotheses, not as synthetic a priori truths. The postulates, unfortunately, were vaguely stated in *Human Knowledge*, and Russell left more detailed work on them unpublished, probably on account of the frosty reception the book received.

By the time *Human Knowledge* was published linguistic philosophy was at its height and Russell’s work had become very unfashionable. Russell had no time for Wittgenstein’s later philosophy, nor for the ordinary language philosophy it inspired. He continued to think that understanding the world, rather than language, was the chief task of philosophy and his last philosophical writings, in the 1950s, were unavailing attempts to stem the tide of linguistic philosophy (see Ordinary language philosophy, school of §§1-3).

NICHOLAS GRIFFIN

List of works

Russell, B.A.W. (1983-) *The Collected Papers of Bertrand Russell*, The McMaster University Edition, various editors, 30 vols anticipated, London: Routledge.(The definitive edition of Russell’s shorter writings and unpublished works. His philosophical papers are to be found in volumes 1-11.)

Russell, B.A.W. (1896) *German Social Democracy*, London: Allen & Unwin, 1965.(Russell’s first book. A study of German Marxism.)

Russell, B.A.W. (1897) *An Essay on the Foundations of Geometry*, New York: Dover, 1956. (The first instalment of the encyclopedia of the sciences. An attempt to rehabilitate a Kantian philosophy of geometry in the light of non-Euclidean geometry.)

Russell, B.A.W. (1900) *A Critical Exposition of the Philosophy of Leibniz*, London: Routledge, 1992.(For long an influential work on Leibniz, it also contains early intimations of Russell’s own realist philosophy.)

Russell, B.A.W. (1901) ‘Sur la logique des relations avec des applications à la théorie des séries’ (The Logic of Relations with Some Applications to the Theory of Series), *Revue de mathématiques* 7: 115-48; trans. R.C. Marsh, in Russell (1983-), vol. 3: 314-49. (The formalization of Russell’s theory of relations in Peano’s logical notation; an early statement of logicism which includes the Frege-Russell definition of cardinal number.)

Russell, B.A.W. (1903) *The Principles of Mathematics*; 2nd edn, 1937; London: Routledge, 1992.(A philosophical prolegomena to logicism.)

Russell, B.A.W. (1905) ‘On Denoting’, *Mind* 14: 479-93; repr. in Russell (1983-), vol. 4: 415-27.(The first published statement of Russell’s theory of definite descriptions.)

Russell, B.A.W. (1906a) ‘On Some Difficulties in the Theory of Transfinite Numbers and Order Types’, *Proceedings of the London Mathematical Society* series 2, 4: 29-53; repr. in Russell (1974), 135-64.(A survey of different approaches to solving the paradoxes.)

Russell, B.A.W. (1906b) ‘On the Substitutional Theory of Classes and Relations’ in Russell (1974), 165-89.(A survey of Russell’s substitutional theory, prepared for publication but withdrawn in the face of Russell’s discovery of new paradoxes.)

Russell, B.A.W. (1906c) ‘Les Paradoxes de la Logique’, *Revue de métaphysique et de morale* 14: 627-50; trans. ‘On ‘‘Insolubilia’’ and their Solution by Symbolic Logic’, in Russell (1974), 190-214.(A defence of logicism against criticisms by Poincaré. In it Russell recognizes violations of the vicious circle principle as the source of the paradoxes.)

Russell, B.A.W. (1908) ‘Mathematical Logic as based on the Theory of Types’, *American Journal of Mathematics* 30: 222-62; repr. in Russell (1956), 59-102.(The first version of ramified type theory with which Russell finally hoped to eliminate the paradoxes.)

Whitehead, A.N. and Russell, B.A.W. (1910-13) *Principia Mathematica*, Cambridge: Cambridge University Press, 3 vols; 2nd edn, 1925-7.(The definitive statement of Russell’s logicism, containing detailed derivations of cardinal and ordinal arithmetic including Cantor.)

Russell, B.A.W. (1911) ‘Knowledge by Acquaintance and Knowledge by Description’, *Proceedings of the Aristotelian Society* 11: 108-28; repr. in Russell (1983-), vol. 6: 148-61.(An early epistemological paper by Russell, dominated by insights gained by his theory of descriptions.)

Russell, B.A.W. (1912a) *The Problems of Philosophy*, Oxford: Oxford University Press, 1974.(A popular introduction to philosophy, with the emphasis on epistemology.)

Russell, B.A.W. (1912b) ‘On the Notion of Cause’, *Proceedings of the Aristotelian Society* 13: 1-26; repr. in Russell (1983-), vol. 6: 193-210.(A sceptical, neo-Humean account of causation, and a denial of its importance for science.)

Russell, B.A.W. (1913) *Theory of Knowledge*, in Russell (1983-), vol. 8.(A major unfinished work on epistemology. Extant parts give detailed discussion of acquaintance and belief.)

Russell, B.A.W. (1914) *Our Knowledge of the External World*, London and Chicago, IL: Open Court; 2nd edn, London: Allen & Unwin, 1926; London: Routledge, 1993.(A deductivist treatment of the external world, programmatically proposing to construct material objects out of sensibilia.)

Russell, B.A.W. (1918) ‘The Philosophy of Logical Atomism’, *The Monist* 28: 495-527; 29: 32-63, 190-222, 345-80; repr. in Russell (1983-), vol. 8: 160-244.(A summary of Russell’s philosophical development to date with a survey of outstanding problems.)

Russell, B.A.W. (1919a) ‘On Propositions: What They Are and How They Mean’, *Proceedings of the Aristotelian Society* supplementary volume 2: 1-43; repr. in Russell (1983-), vol. 8: 278-306.(The first statement of Russell’s neutral monist theory of belief.)

Russell, B.A.W. (1919b) *An Introduction to Mathematical Philosophy*, London: Routledge, 1993. (A popular introduction to the logic of *Principia*.)

Russell, B.A.W. (1921) *The Analysis of Mind*, London: Routledge, 1992.(The fullest statement of Russell’s neutral monism.)

Russell, B.A.W. (1927) *The Analysis of Matter*, New York: Routledge, 1992.(The definitive statement of Russell’s structural realism about the external world.)

Russell, B.A.W. (1936a) ‘The Limits of Empiricism’, *Proceedings of the Aristotelian Society* 36: 131-50.(An admission that pure empiricism is an insufficient basis on which to construct science.)

Russell, B.A.W. (1936b) ‘On Order in Time’, *Proceedings of the Cambridge Philosophical Society* 32: 216-28; repr. in Russell (1956), 347-63.(A formal construction of temporal order based on Russell’s event ontology.)

Russell, B.A.W. (1940) *An Inquiry into Meaning and Truth*, London: Routledge, 1992.(As much metaphysics and epistemology as semantics. An important statement of Russell’s later position.)

Russell, B.A.W. (1945) *A History of Western Philosophy*, London: Routledge, 1993.(A popular, entertaining and brilliantly witty history. Scholars may sneer, but it’s well worth reading.)

Russell, B.A.W. (1948) *Human Knowledge: Its Scope and Limits*, London: Routledge, 1992. (Russell’s last major statement in epistemology.)

Russell, B.A.W. (1956) *Logic and Knowledge: Essays 1901-1950*, ed. R.C. Marsh, London: Routledge, 1992.(A collection of important essays, edited by Marsh in collaboration with Russell.)

Russell, B.A.W. (1959) *My Philosophical Development*, London: Routledge, 1993.(Russell’s philosophical autobiography.)

Russell, B.A.W. (1967-9) *The Autobiography of Bertrand Russell*, London: Allen & Unwin, 3 vols.(The full autobiography of Russell’s life and times, including his political activism.)

Russell, B.A.W. (1974) *Essays in Analysis*, ed. D. Lackey, London: Allen & Unwin.(Further essays, with more of a bias towards logic. Contains a very useful three-part bibliography.)

Wittgenstein, L.J.J. (1922) *Tractatus Logico-Philosophicus*, trans. D.F. Pears and B.F. McGuinness, London: Routledge & Kegan Paul, 1966.(An astonishing and exceedingly difficult work by the other logical atomist, cited here for its criticisms of the logical foundations of *Principia*.)

Russell: The Journal of the Bertrand Russell Archives (1971-) publishes articles on all aspects of Russell's life and work.

Russian Empiriocriticism

Russian empiriocriticism was an ephemeral movement within Russian Marxism of the early twentieth century. Its brief existence and deep involvement in politics invite the judgment, 'of historic interest only'. But that pat phrase dodges the problem of comprehending history and acting appropriately, which obsessed such thinkers as A.A. Bogdanov (1873-1928) and A.V. Lunacharskii (1875-1933), the best-remembered of the Russians who looked to Mach and Avenarius for philosophic support of Marx. In its German origins empiriocriticism was an academic effort to avoid metaphysics while analysing experience as the source of knowledge. In Russia the focus moved outside of academic cloisters. How is one to relate action to social understanding, if one knows that action and understanding shape each other within an overwhelming process of socioeconomic transformations? Analysis of 'experience' or 'practice' in the Russian context - a 'backward' society under a tyrannical state in an age of total war - nullified the academic calm of Mach and Avenarius. Their Russian admirers wanted to justify Marx's claims of social knowledge that would be both scientific and revolutionary; they rejected philosophies that merely interpret the world in different ways, while the task, described in Marx's final 'Thesis on Feuerbach', is to change it.

1 Philosophy and politics

Insistence on a revolutionary fusion of philosophy, social science and political action was a common feature of Russian radicals, offered in justification of diverse philosophical and political positions. 'Orthodox' believers in 'dialectical materialism', a name that Plekhanov devised in 1891, were Menshevik as well as Bolshevik (the two wings of the Russian Marxist party, which split into antagonistic parties by 1912). Countercurrents of 'revisionist' philosophy emerged on both sides of the split, though mostly among the Bolsheviks, perhaps because the greater wilfulness of Bolshevik politics invited some drastic revision of 'materialist fatalism', some turn to schools of philosophy which privileged 'experience' and 'will'. Lenin denounced them all as 'subjective idealism', in *Materializm i ėmpiriokrititsizm (Materialism and Empiriocriticism)* (1909), but his polemic did not end their linkage with Bolshevism. Even after the 1917 Revolution Bogdanov defended his mixture of Marxism and empiriocriticism within the Communist Academy. Lunacharskii, who was the Soviet Commissar of Education until 1929, Pokrovskii, the chief of higher education, and Bukharin, the major communist ideologist of the 1920s, showed their partiality more discretely, for confession of orthodoxy was becoming obligatory within the communist state (see Marxist Philosophy, Russian and Soviet §§1-3).

'Revisionism' in philosophy should not be equated with 'reformism' in politics just because a few of Marx's German disciples proposed that equation at the turn of the century. It was formally rejected even in Germany, where the Marxist party was becoming reformist in political action while clinging to a professed faith in orthodox revolutionary theory. In Russia virtually all Marxists disdained political reformism both in theory and in practice; they took for granted an inevitable lower-class upheaval, and split on political strategies and theoretical justifications for guiding the working classes through revolution to democracy and socialism.

Such tangles of political and philosophical issues have preoccupied scholarly interest in Russian empiriocriticism, with a chronic temptation to impose simplistic correlations - such as the linking of Bolshevik wilfulness with radical positivism or Nietzschean voluntarism. The Russian Marxists themselves, whether orthodox or revisionist, were sufficiently open-minded to restrain that temptation during their first four decades, from the 1890s until Stalin's 'revolution from above' in 1929-32 (see Marxist philosophy, Russian and Soviet §4). His 'great break' initiated a strict party line in philosophy; before that violent establishment of uniformity Russian Marxists usually took for granted some variety of debatable correlations between philosophical views and political positions.

Nevertheless a difference in mentalities was emerging in those first forty years. Whether Menshevik, Bolshevik or in between, the Marxists who were not embarrassed to call themselves 'orthodox', though they rejected traditional religions and were closing their minds to new developments in philosophy. Their critics within the Marxist movement were trying to adapt it to the new positivism, which was retreating from the visionary claim that science yields a guiding plan of human history. Some of the critical Marxists were also succumbing to the new Romanticism, as we may call the insistence by Nietzsche and James that beliefs precede the reasoned inquiry which serves them, that action is the ground of human being and reason its ancillary. Goethe's blasphemous

inversion of Genesis - 'In the beginning was the deed' - was a favourite quote within all Marxist trends; they divided on ways to confess such irrationality and still to justify their claims of rationality. The orthodox way was to barricade the mind within a confessional creed, favouring defensive apologetics rather than critical inquiry, claiming to be rational critics of their own beliefs while actually shutting off the possibility. The revisionist way was to resist that closing of the Marxist mind; revisionists would neither quit the movement nor quit criticizing it.

The movement - parties committed to Marxism - was swiftly growing in Germany and in Russia, while grand philosophical systems were disintegrating, obliging thoughtful militants to decide whether they were committed to a grand system, to a cluster of particular theories claiming scientific justification, to a mode of inquiry for the guidance of action, or to some combination of all three - with the possible admixture of an irrational will to power. Orthodox Marxists, such as Plekhanov and Lenin, tended to beat down such questions in polemics against those who asked them, in vehement defence of vague generalities. For example, they denounced positivism in name and praised dialectical materialism, but tended to favour the notion that a queenly discipline of philosophy withers away as each branch of knowledge becomes a genuine science. The Russian Marxists who scoffed at dialectical materialism and studied empiriocriticism were less content with generalities, and more receptive to the corrosive inquiry that disintegrates grand schemes. Yet they wound up, paradoxically, doing more system-building than their orthodox opponents.

2 Bogdanov

The paradox was most evident in Bogdanov, known as the chief 'Machist' among Russian Marxists, though he repudiated the label. He created 'empiriomonism', which was supposed to overcome, unlike Mach's empiriocriticism (see Mach, E. §2), the fragmentation of modern knowledge and the surrender to history as blind process or 'elementalism'. (The Russian word, *stikhiinost'*, is commonly mistranslated as 'spontaneity', though the root is Greek *stoicheion*, element, and the Russian meaning is not free agency but mindless process.) Seeking a unified science of all sciences, which would bring organized consciousness to the 'elemental' upheaval of the lower classes, Bogdanov drew first on Ostwald's 'energeticism'. He liked its vision of science as the monistic inquiry that studies energy in its transformations, culminating in human consciousness with its capacity for rational organization. But he criticized Ostwald for confusing the unity of scientific method with a notion of energy as metaphysical substance, and found in Mach's analysis of experience complete escape from metaphysics into methodology. Yet Bogdanov's Mach was ancillary to his Marx, methodology to worldview, for he insisted that human experience is collective, historically developing, organized by evolving 'ideology', Bogdanov's umbrella category for all forms of knowledge and art at all stages of human development, which he brought to order in empiriomonism.

Bogdanov claimed, in effect, to be creating a system that was not a system. 'Empiriomonism' indicated both 'the final philosophical goal, the ideal of cognition' and 'the way to it, the effort to give as coherent a world picture as possible for our time and for that social class to which I have devoted myself'. To support that version of Marxism he relied not only on contemporary positivists. Zarathustra's declaration, 'Man is the bridge to the superman', served as epigraph to an early article, gesturing towards a future transcendence of present values. But a subsequent explanation pointed backward in time:

> The ideal of a complete and powerful, harmonious and all-victorious life, which is expressed in the sculptures of the ancient world, and in the statues of their gods, is clearer and, I would suggest, deeper than Nietzsche's 'superman' in philosophy.
>
> (Bogdanov 1911: 17)

He did not examine in depth the implicit clash between Romanticism and classicism, that is, between a vision of human values in open-ended creation and a vision of endless striving towards a changeless ideal.

Bogdanov's eclectic mixture was still Marxism, he insisted, for various philosophies were 'materials' for his theorizing, but 'the social philosophy of Marx…has been the regulator and the method of my work'. He disagreed with revisionists who argued that Marx's social theorizing lacked philosophical justification. Bogdanov found it in Marx's vision of the historical process, which, in his rendition, resembled Comte's three-stage scheme: first an authoritarian social system justified by religious thought; then an individualist stage with an exchange economy and speculative systems of thought; finally the collective stage and scientific thought, which were coming together

in the proletarian struggle for emancipation within industrial society (see Comte, A.). Out of that struggle Marx had distilled a guiding consciousness, which needed further development as ‘empiriomonism’ or ‘universal organizational science’ or ‘tectology’. Bogdanov moved from one term to the next in the course of his prolific writing from the 1890s to the 1920s. (He borrowed the word ‘tectology’ from another scientific monist of the period, Ernst Haeckel, who grounded his grand system in biological rather than social science.)

Some scholars have interpreted Bogdanov as a thinker like Sorel, who declared social theorizing to be myth-making that justifies the wilful behaviour of social groups. Others have narrowed Bogdanov’s vision of organizational science to mathematical modelling of ‘systems’, and picture him as a forerunner of cybernetics. Still others, the present author included, take due note of Bogdanov’s strenuous *resistance* to the separation of mythopoeic from scientific modes of thought, of subjective from objective aspects of experience. That resistance sustained his old-fashioned positivist faith in science as unified knowledge that reveals the whole pattern of history, while he ostensibly confronted the downfall of such pretensions, the rising critical insistence that knowledge is irremediably partial, in both senses of the word: limited and biased. Bogdanov tended to evade the version of this antinomy that was most distinctive of Marx, the striving for a history of socioeconomic formations that would be simultaneously particular and universal, true to the variegated past of human societies and predictive of an authentically human future for all. A dreamy abstraction marked the ‘general task’ that Bogdanov set for ‘empiriomonism’: ‘to find the way by which it would be possible to systematically reduce all the discontinuities [*pereryvy*] of our experience to a principle of continuity [*nepreryvnost’*]’ (*1905-7: vol. 1, 173*).

Bogdanov’s disagreements with Lenin have sometimes been interpreted as a clash between freedom and authoritarianism within emergent communism, though both agreed, while founding the Party, that it must bring disciplined collective ‘consciousness’ to the ‘elemental’ struggle of the lower classes. Bogdanov distinguished between authentic revolutionary consciousness, a free collectivism that he attempted to encourage in the movement for ‘proletarian culture’, and the false consciousness of a social group in bondage to ‘verbal fetishism’ or ‘vampirism’. Those were his favourite cursewords for blind worship of dead formulas, idolatrous cults that feed on the revolutionary movement. Since he published such criticism of the Leninists as they took power, he has been praised as an original Bolshevik who tried to keep alive the yearning for ‘utopia’ as present consciousness, endlessly disturbing to those whose chants of a distant ‘utopia’ soothe the slaves of ‘verbal fetishism’. That praise may not be compatible with tributes to him as a prophet of ‘systems theory’ and computerized society - or with the view of him as ‘the red Hamlet’, tragically baffled by the conflicting demands of thinking and doing. It remains to be seen which view of Bogdanov, or indeed whether any significant interest in him, will survive the collapse of the state that turned Russian Marxism into a petrified orthodoxy.

3 Lunacharskii and others

The same question hangs over the other theorists who tried to keep Russian Marxism alive by infusion of new philosophies. In the Soviet period Lunacharskii seemed to have a lasting hold on posterity, but the reasons may have been more political than intellectual. He had been expelled from Lenin’s party along with Bogdanov in 1909, but he rejoined in 1917, as Bogdanov did not. He was Commissar of Education for the first twelve years of the Soviet state, died before the wild destruction of ‘old Bolshevik’ survivals in the late 1930s, and enjoyed a revival in the post-Stalin efforts to revitalize the communist vision. His flood of publications was more varied than Bogdanov’s, with artistic flair to draw readers in and less abstractness to tax their patience. Literary critic and playwright as well as philosophical essayist and revolutionary boss, Lunacharskii was, like Trotsky, a spectacular analogue to the men of letters who played major roles in the ‘bourgeois’ revolutions of an earlier age. Yet these Russian stand-ins for Jefferson and Condorcet, however energetic and creative, were at odds with their era, which splinters the intellect into specialized disciplines and puts the label ‘superficial’ or ‘dilettante’ on those who cling to the tradition of the universal mind.

Lunacharskii studied with Avenarius at the University of Zürich, but grinding at the self-doubts of academic positivism could not confine a spirit captivated very early, as he confessed, by ‘religious and artistic expressions of man’s life of the heart’. They became his ‘authentic *life’s problem*’ after an ‘ecstatic "conversion to Marxism"’. Most Marxists recoiled against such talk, insisting that their doctrine was not religion but science. Lunacharskii argued that it was both. Marx had endowed the socialist faith with knowledge of the historical process, but that ‘cognition of the world’ still needed an appropriate ‘evaluation of the world’, which projected human preferences

into an otherwise indifferent universe. Thus Lunacharskii became a leader of ‘God-building’, as a sympathetic Maksim Gorkii named the effort to create a faith out of human aspirations, to connect each ephemeral life with a progressive reality larger than itself.

> To live the life of a human being means to see and to feel the past as one’s own, even before one’s day of birth, and the future as one’s own, *really one’s own*, even beyond the grave; this means to be conscious of oneself as a mortal part of an immortal element [*stikhiia*] - of the collective life.
>
> (1909: 87)

Lunacharskii dismissed the similarity with Comte’s religion of humanity, which he considered a ridiculous imitation of Catholicism. He derided ’Plekhanovist’ orthodoxy as ’materialist fatalism’, an unacknowledged religion that invoked cosmic processes for assurance of human progress, culminating in socialism. Not mindless atoms and indifferent galaxies, he insisted, but evolving social practice was the ground of Marx’s theorizing, and therefore Bogdanov was ’the sole Marxist philosopher continuing the pure philosophical tradition of Marx’. Lunacharskii ridiculed ’the guards at the Marxist museum…who have raised cries of heresy’, while they reviled the demand for clear distinctions between the true faith and taboo beliefs. Such mockery was part of his serious argument that knowledge of humanity’s progress towards socialism must be charged with intense feeling if the movement is to go forward as our knowledge tells us it must.

Lunacharskii’s aesthetic theorizing also rested on insistence that knowledge and feeling are necessarily intermixed. He joined Nietzschean versions of that theme with biologistic talk, taken from Avenarius and Spencer, of nerve energies raised towards a destructive level, and released in some life-enhancing way. He distinguished two types of that aesthetic discharge: art as play and art as mobilization of emotion for work or struggle. Thus, as early as 1904, he came to a formula for a kind of art that would be called ’socialist realism’ in the Soviet period:

> To beautify the people’s life as much as possible, to draw pictures of the future gleaming with happiness and perfection, and along with that [to picture] the repulsive evil of the present, to develop the sense of tragedy, the joy of struggle and of triumph, of promethean striving, of stubborn pride, of unyielding courage, to join hearts in a general feeling of the urge toward the superman [see Nietzsche: impact on Russian thought §3].
>
> (1967: vol. 7, 99)

Such formulaic prescriptions were at odds with Lunacharskii’s enthusiasm for modernist revolts against prescriptive formulas, for art as experience reshaped in unpredictable forms. Praise of modernist writers flowed continuously from his pen, whether in theatre reviews for a pre-revolutionary newspaper or in lectures on West European literature at a communist university in the 1920s. Indeed, an enthusiastic preface to a Soviet translation of Proust was the last thing he wrote, in 1933, just before his heart stopped. Yet his aesthetic theorizing anticipated the formulaic rigidity of ’socialist realism’, and so did the aesthetics of other Russian Marxists, both revisionist and orthodox. (See especially essays by Lunacharskii, Trotsky, Bazarov, Iushkevich and so on, attacking ’literary decadence’ in *Literaturnyi raspad*, 1908-9). The anarchic creativity of the artistic avant-garde and the mobilization of political commitment by the revolutionary vanguard were at odds within Lunacharskii’s mind, as in Russia at large. He tried to reconcile the contrary currents, ultimately without success. He was committed to action on behalf of a revolution that was drifting into cultural petrifaction, a dreadful position for one who held social practice to be the criterion of truth.

The same can be said of nearly all the Russian thinkers who tried to enrich Marxism with new forms of positivism or Nietzscheanism. After the Soviet revolution most of them tried to work for the new regime. N. Valentinov - pen-name of N.V. Vol’skii (1879-1964) - who went West and turned against the whole revolutionary project, was exceptional, and even he tried to serve the Soviet cause for twelve years. V.A. Bazarov - pen-name of Rudnev (1874-1939) - hung on, tried to bend socialist economic theorizing towards realism, and was condemned for ’wrecking’ in 1931. Ia.A. Berman (1868-1933) seems to have suffered a similar fate. P.S. Iushkevich (1873-1945), creator of ’empirio-symbolism’, singled out by a recent historian as ’the most eloquent and outspoken protestor against dogmatism’ before 1917, survived afterward as a translator.

The experience of these thinkers must have some lesson for philosophies that claim ’experience’ or ’practice’ as the criterion of knowledge, but it may be impossible to specify the lesson without falling into vicious circularity - claiming to know how ongoing experience will work out - or leaping beyond historical experience, to romantic

claims of transcendent knowledge. If the social process to be comprehended is both a determinant and a product of the action to be taken, claims of comprehension may be masks of interests to be served, or worse yet, of interests poorly served, by a rash will to power or a cowardly fatalism, or by some confused fluctuation between the two extremes. Such issues, which threaten vicious circularity for all believers in the primacy of experience or practice, become painful dilemmas when would-be activists confront economic backwardness, tyranny, catastrophic wars, lower-class revolts and national conflicts, such as the Russian Empire and the USSR experienced in the twentieth century.

Russian literary Formalism

Russian literary Formalism, an active movement in Russian literary criticism from about 1915 to 1929, approached the literary work as a self-referential, formed artefact rather than as an expression of reality or experience outside the work. It asked the question, 'How is the work made?' rather than 'What does the work say?' Its founding assumption, that poetic language differs from the language of ordinary communication, spawned numerous investigations of what the Formalists called 'literariness' - the qualities that make a work artistic. This distinction between practical and poetic language also allowed the Formalists to argue that literature was an autonomous branch of human activity, evolving according to its own immanent laws rather than as a consequence or reflection of historical events. Proceeding from this theoretical model, the Formalists viewed literary works as responses to previous literature rather than to the outside world.

In their literary theory and their interpretations of particular literary works, the Formalists were reacting to the predominant tendency of Russian literary criticism to draw direct correspondences between lived experience and the literary work. Boris Eikhenbaum, Roman Jakobson, Viktor Shklovskii, Boris Tomashevskii, Iurii Tynianov and other Formalists questioned accepted correspondences between life and art, casting doubt upon realist interpretations of Russian authors such as Gogol' and Tolstoi, and examining the narrative structure of non-Russian works such as Tristram Shandy and O. Henry's short stories. Their analyses showed how intonation, word order, rhythm and referential meaning interact within a literary work, and they argued that literary works are less a reflection of life than an attempt to refresh conventional perceptions. The influence of Russian literary Formalism is felt in more recent theoretical schools such as semiotics, structuralism, deconstruction, feminist criticism and new historicism, in so far as all of these take account of the particular use of language in any literary work.

1 Practical versus poetic language

Russian literary Formalism can be roughly divided into three periods. From 1915 to 1919, it sought to establish the distinction between practical and poetic language; from 1919 to 1921 it investigated the use of poetic language in particular literary works; and from 1921 until 1929 it examined literary works as responses to previous literary history. The movement began as part of the avant-garde experimentation in the arts in the years surrounding the Bolshevik revolution of 1917. Its practitioners formed two groups: the Moscow Linguistic Circle, which included Roman Jakobson, Pëtr Bogatyrev, N. Trubetskoi and Grigorii Vinokur; and its sister group in St Petersburg, the Society for the Study of Poetic Language (*Opoiaz*), whose members included Osip Brik, Boris Eikhenbaum, Lev Iakubinskii, Evgenii Polivanov, Viktor Shklovskii, Boris Tomashevskii and Iurii Tynianov. This collaboration between linguists and literary scholars addressed language as the focal point of literature. Verbal texture was examined as the artistic medium of literature, which contributed to message. In seeking to build an objective theory of literature, Russian literary Formalism ignored authorial intention, biography and social and historical conditions, the better to focus on the work itself.

Taking its cue from the sound experiments of Russian Futurist poetry, early Formalism drew attention to the non-referential aspects of language, particularly to the role of sound. In 'Voskreshenie slova' (The Resurrection of the Word) (1914), which may be considered the inaugural work of Russian literary Formalism, Viktor Shklovskii declared that the expressive impact of words was dulled by habitual usage and that the purpose of literature was to restore to words a sense of newness and to stimulate new perceptions. In 'Iskusstvo kak priëm' (Art as Device) (1916), Shklovskii introduced the concept of *ostranenie* ('defamiliarization') to refer to the ways in which literary works may overturn conventional perceptions.

The whole edifice of Russian Formalist theory rests on the differentiation between practical and poetic language, formulated by Iakubinskii in his 1916 article, 'O zvukakh stikhotvornogo iazyka' (On the Sounds of Verse Language). Iakubinskii argued that the goals of ordinary speech and poetic language were fundamentally opposed. Everyday utterances were aimed at rapid, efficient communication, and to that end they employed readily recognizable formulations. This 'automatized' language, as the Formalists termed it, grown familiar through repeated, habitual use, had attained a narrow functionality at the expense of its vitality and richness. The goal of poetic speech was to restore the palpability of language that is lost with quick recognition. Poetic language, said

Iakubinskii, retards the process of comprehension while making it multilayered, bringing out a wealth of accumulated meanings. Where practical language is highly referential, pointing unambiguously to objects and ideas, poetic language is largely self-referential, drawing attention to the verbal pattern of the work.

In their preoccupation with the renewal of automatized perceptions and with the properties of language, the Formalists were influenced by Andrei Belyi and Henri-Louis Bergson. Belyi's 1910 book, *Simvolizm (Symbolism)*, had attempted to establish an 'anatomy of style' by counting syllables, accents and parts of speech in thousands of lines of verse. Following Belyi, the Formalists took an almost scientific approach to literary analysis.

Until about 1919, Russian literary Formalism was occupied with attempts to characterize poetic language, investigating the question of how the renewal of automatized language was achieved. Studies by Brik, Polivanov and Shklovskii showed that in poetry and other short genres words were selected for their auditory properties no less than for their referential meaning. They explored sound patterns in literary texts, showing that meaning resides in sound as well as in semantics. Shklovskii in particular identified literary 'devices', such as retardation (the intentional slowing down of plot development to create suspense), parallel story lines and repetitions. Plot development itself was shown to be a device: the chronology of a narrative could be rearranged to achieve particular effects. The presumed chronological order of events in a narrative the Formalists termed *fabula* (frequently translated as 'story'); the artistic rearrangement of events for purposes of narration they called *siuzhet* (usually rendered as 'plot'). As with the distinction between practical and poetic language, here too the Formalists cast matters in terms of an opposition between the non-literary (*fabula*) and the literary (*siuzhet*).

2 Literariness

The Formalists' emphasis on the device and their attention to arrangement and selection of verbal elements were an attempt to account for what Jakobson termed the *literariness* of the work. Message was necessarily affected by presentation, so that a work's literariness was an integral and inseparable part of its message or content. Instead of seeing form as a covering imposed on a pre-existing content, the Formalists rejected the dichotomy of content and form, seeing words, syntax and intonation as simultaneously both content and form. The literary work consisted exclusively of formed content.

Formalist theory and practice were part of a strident literary debate with Russian Marxist critics, and many Formalist statements were deliberately polemical and one-sided. Formalism shared its polemical stance and emphasis on form with Russian Futurist poetry, which emphasized sounds in isolation from meaning; the 'self-valuable' word; neologisms; and shock value. Shklovskii's widely publicized statement, 'art is the sum of its devices', was an example of the polemical nature of Formalist utterances, as were his assessment of Laurence Sterne's *Tristram Shandy* as the most typical novel of world literature, and his categorical statement that a literary work is nothing but form.

In spite of such catchwords and slogans, the Formalist emphasis on form in no way dismissed meaning. Eikhenbaum's study of verse intonation in his book *Melodika russkogo liricheskogo stikha (Melody in Russian Lyric Verse)* (1922) examined the interaction of lexical meaning and syntax in dozens of poems, showing that literary interpretation rested on the blend of the semantic and the formal. Formalism sought to displace the usual explanation of content as a reflection of the non-literary world, replacing it with an approach to content as a literary component of a work. What the Formalists objected to (like the American New Critics after them) was the attempt to paraphrase a work's content, extracting it from the verbal blend. The problem with the content-form dichotomy was that it implicitly equated content with meaning.

With the distinction between poetic and practical language in place, the Formalists began to examine the workings of poetic language in specific literary texts. This middle stage of Formalism, lasting from about 1919 to 1924, treated the literary work as a 'dynamic system' in which contrasting and often conflicting features competed for primacy. Instead of matching each other and forming a congruous whole, elements such as rhythm, syntax and intonation were shown often to be at odds, forcing concessions from one another in a struggle for dominance. At the heart of poetic language the Formalists saw not harmony but dissonance, incongruity and struggle. This followed logically from their premise of automatization: the need for poetic language constantly to renew and defamiliarize meant the creation of new, unexpected combinations of linguistic and semantic material. Borrowing from the German aesthetician Broder Christiansen the concept of the *dominanta*, Tynianov in *Problemy*

stikhotvornogo iazyka (Problems of Verse Language) (1924) theorized that the prevailing element in this struggle deformed the others. Tynianov introduced the term ‘constructive principle’ to refer to the relationship between the *dominanta* and the other elements in a work. Shklovskii’s catch-phrase ‘art is the sum of its devices’ was now shown to be an oversimplification: art was far more than the mere *sum* of its parts, because the meaning of each part was dependent on the whole context created by the work. Each element served to place the others in relief.

To view the literary work as a ‘system’ was to see it as a self-created world rather than an imitation of outside reality or referent. In this the formalist concept of the literary work paralleled the work of Ferdinand De Saussure (§2) on the sign. Saussure’s sign, which consisted of mental concept (signified) and word (signifier), took no account of the referent, which was completely outside the sign. Similarly, for the Formalists ‘content’, like referent, was completely outside the literary work, which consisted of aestheticized meaning - the interaction of all components of the literary work.

Since the goal of poetic language was to renew familiar, automatized language, and since what was familiar changed over time, it followed that what constituted poetic language in one epoch would cease to be poetic in the next. Poetic language itself was susceptible to automatization through repeated usage in different works, thereby losing its poeticity. Writers trying to overcome the automatized conventions of their literary ‘fathers’ would turn to works by their ‘grandfathers’ or ‘uncles’ for devices that might revitalize exhausted genres. In ‘Noveishaia russkaia poéziia’ (Modern Russian Poetry) (1919), Jakobson stated that new literary forms arise to replace previous literary forms that have become exhausted. This position, for which the Formalists found precedent in the work of the nineteenth-century Russian ethnographer Aleksandr Veselovskii, contrasted with the widely held view of the nineteenth-century civic critics and the Bolsheviks that new forms in literature are needed to express a new content, such as a change in the structure of society.

3 Literary evolution

In building change into its model of poetic language, Russian literary Formalism differed from theories that applied a formulaic description to all works of a given genre. Poetic language was by definition *new* language. In ‘O literaturnoi ėvoliutsii’ (On Literary Evolution) (1927), Tynianov described this process of renewal and change in poetic language as a four-step cycle of literary evolution: (1) a new constructive principle arises to replace the previously dominant one that has finally become automatized; (2) the new constructive principle gains currency in new literary works; (3) it becomes more widespread; (4) it becomes automatized and evokes opposing constructive principles.

The concept of a constructive principle within a dynamic system whose elements are constantly colliding allowed the Formalists to challenge accepted interpretations of major literary works, especially those widely characterized as examples of realism. Eikhenbaum’s seminal article on Gogol’’s short story ‘The Overcoat’ called into question the consensual interpretation of that story as a portrayal of the humble man disdained by his colleagues and superiors in an inhumane society. Eikhenbaum argued that the ‘realist’ passages, including the famous words ‘I am your brother’, universally interpreted as a plea for recognition of human dignity, constitute only one strand of Gogol’’s narrative, and that they are undercut by another, comic strand woven out of sheer linguistic play. When a realist narrative is placed in the context of a linguistic game, Eikhenbaum argued, its meaning is altered.

Eikhenbaum’s article reflected the Formalist bias that realistic mimesis was not the main business of literature. Having established that each work constituted an aesthetic system, the Formalists now had an approach to literature that could be offered as an alternative to realist readings. A system of interacting elements meant that the function of a device could change depending on its context. Furthermore, the workings of this dynamic system, the demands of artistic presentation, worked against an accurate reflection of the world. Aesthetic requirements conflicted with factual accuracy; literary works on historical themes might need to sacrifice historical accuracy in the interests of aesthetics.

4 Autonomy of literature

The differentiation between practical and poetic language, as well as the notion of system, allowed the Formalists to claim that literature was an autonomous activity not chained to economic, social or political reality. The Formalists thus liberated literary studies from the mimetic orientation that sees the work as a reflection of the

world. Such harnessing of the literary work to the outside world had been the practice of mainstream Russian literary criticism. It characterized the radical civic critics of the mid-nineteenth century, who pressed literature into the service of social justice; the academic critics of the cultural-historical and cultural-psychological schools; and also the Marxist critics who gained legitimacy after the Bolshevik Revolution and with whom the Formalists engaged in bitter polemics. Russian literary Formalism set out to make literary criticism into a scholarly discipline by constructing an 'objective' theory of literature, centred on the work itself, that would not subordinate the study of literature to other disciplines. Most of the Formalists' theoretical concepts, such as their early emphasis on sound and the palpability of the word, pointed to the work itself rather than to the cultural context that produced it.

The case for literary autonomy was a major achievement of Formalism while simultaneously containing the germ of its demise. The notion on which autonomy rested - that of a poetic language whose definition lay in the revitalization of automatized forms - accounted merely for the fact of literary change, not for the actual direction of change at any given time. By the mid-1920s, it became clear that the automatization/revitalization dynamic, while at least partly valid, left too many questions unanswered, and that the answers were to be found in the non-literary contexts that Formalism had dismissed as irrelevant to literariness and aesthetics. Within the confines of the purely work-centred poetics, no further insights were possible.

In an attempt to incorporate some of these contexts without sacrificing the literary autonomy for which Formalism had fought so hard, Tynianov proposed a modification of Formalist theory. His article of 1927, 'On Literary Evolution', put forth a model of culture presenting its various aspects - economic, social, political, religious, linguistic, literary - as parallel, autonomously developing lines, or 'series'. Tynianov's model preserved the Formalist premise of literary autonomy, since each series had its own immanent development that was not directly affected or 'caused' by any other series. Indirect influences from other series, however, could occur, passing vertically from one series to the next as though through a porous membrane. The most significant influence, Tynianov suggested, would come from the neighbouring series; influences from more distant series, which would have to pass through the intervening series, would be modified along the way and more difficult, if not impossible, to trace. Initially Tynianov maintained that the literary series had as its closest neighbour the linguistic series; subsequently, in a collaborative article of 1928, 'Problems in the Study of Literature and Language', Tynianov and Jakobson proposed that the series change their positions, so that in different eras the literary series might border on the economic, the social or the political.

At the same time that the model of the parallel series was intended to reinvigorate the increasingly repetitive practice of Formalist criticism by admitting a select amount of extra-literary information into literary interpretation, it also challenged the Marxist model of economic base and cultural superstructure (see Marx, K §8). Tynianov's model, in providing for immanent development within each series, conferred on literature and all other activities an autonomy that was incompatible with the notion of a base reflected in a superstructure.

With the rigid controls imposed on literature, philosophy and theory at the close of the 1920s when Stalin consolidated his power, the Formalists had to abandon the attempt to open their literary theory to include extra-literary factors. Those Formalists who remained in Russia by and large omitted theoretical issues from their subsequent writings. The tendency of post-structuralist literary theories to place literary works in their broader cultural context addresses an omission of Formalism; but these same critical schools have internalized the founding Formalist assumption that the construction of the linguistic/literary utterance is central to meaning.

Russian Materialism: ‘the 1860s’

No tradition of philosophical materialism existed in Russia until the years conventionally called ‘the 1860s’ - roughly, the period from the death of Tsar Nicholas I in 1855 to the attempted assassination of Tsar Alexander II in 1866. During that time philosophical freethinking, under the delayed influence of the French Enlightenment and the contemporaneous influence of post-Hegelian German materialism, came together with political radicalism to create a major social and intellectual movement with a broadly materialist philosophical foundation.

The theoretical underpinnings of the movement were elaborated in Russia (as far as tsarist censorship would permit) by Nikolai Chernyshevskii, Dmitrii Pisarev, Nikolai Dobroliubov, Ivan Sechenov and others, and more freely in emigration by Mikhail Bakunin. Their ‘materialism’ was less a precisely articulated ontological position than a grand, science-worshipping worldview that sought to undermine both religion and the state; its elements included naturalism and universal causal determinism in metaphysics, empiricism in epistemology, reductionism in the philosophy of mind, ‘rational egoism’ in ethics, revolutionary socialism in political philosophy and realism in aesthetics. Because of their extreme opposition to established authority and traditional values, the representatives of this movement came to be called ‘nihilists’, and under that name they were portrayed in best-selling novels of the day by Ivan Turgenev and Fëdor Dostoevskii.

Government repression after 1866 put an end to the open development of this materialist movement, but the writings of its leaders proved to be an inspiration to Georgii Plekhanov and Vladimir Lenin, the founders of Russian Marxism. Under Communism, the materialists of ‘the 1860s’ were honoured in Russia as great philosophers and important precursors of Marx.

1 Intellectual lineage

Although Soviet Marxist historians of philosophy laboured for decades to find a native materialist tradition in Russian philosophy extending back to the eighteenth century, no such tradition is discernible until the mid-nineteenth. The influence of the French Enlightenment, encouraged in Russia for a time by Catherine the Great, can be seen in the thought of Aleksandr Radishchev (1749-1802) and the ‘Russian Voltairians’, but none of them actually advanced a materialist ontology or significantly influenced the later Russian thinkers who did, and the same is true of other alleged early ‘materialists’ such as Mikhail Lomonosov (1711-65) and the theoreticians of the abortive Decembrist uprising of 1825. The eighteenth-century Enlightenment affected only a small stratum of Russian society and did little to change the overall religious, idealistic direction of Russian philosophical thought - a direction that was reinforced with a vengeance by the repressive measures of Nicholas I, the ‘Tsar-disciplinarian’, upon his accession to the throne in 1825 (see Enlightenment, Russian).

Materialism came to Russia in the nineteenth century as it had come to Germany - as a reaction against German Idealism; and in both countries the trend was initiated by Ludwig Feuerbach. Among the liberally minded, Western-oriented Russian intelligentsia, brief but intense infatuations with Schelling, Hegel and Fichte (see Schellingianism; Hegelianism, Russian; Fichte, J.G.) were followed by enthusiasm for Feuerbach, whose views became known in Russia shortly after the publication of his *Das Wesen des Christentums (Essence of Christianity)* in 1841, despite official prohibition of his writings. But the materialist trend in philosophy that Feuerbach inspired did not become a broad movement in Russia until the death of Nicholas I in 1855 and the end of the Crimean War a year later. When it did, its tone was set more by the German ‘scientific materialists’ who had succeeded Feuerbach - Ludwig Büchner, Jacob Moleschott and Karl Vogt (see Materialism §3).

The bitter experiences of the Crimean War persuaded many Russians of the need for radical social reform, and the accession of Alexander II offered hope of movement in that direction. Censorship was eased somewhat, and as a consequence new books were available and new journals appeared. A vigorous progressive spirit arose, leading in 1861 to the long-sought emancipation of the serfs. Philosophically this new spirit was manifested in a secular, empiricist attitude that put its trust in reason and science to sweep away the accumulated evils of the past and set society on the path of progress. It was the Enlightenment revisited. Indeed, since Russia’s eighteenth-century Enlightenment was so shallow and limited that Nicholas could easily obliterate it, this was in effect the true Russian Enlightenment. Leon Trotsky called ‘the 1860s’ ‘our short-lived eighteenth century’ (see Lampert 1965: 6).

If the German materialists were the Diderot and Holbach of the delayed Russian Enlightenment, Büchner’s notorious *Kraft und Stoff (Force and Matter)* (first published in German in 1855) was its *Encyclopédie*. Called ‘the Bible of the German materialism of the present day’ by the historian of philosophy Friedrich Ueberweg, the book was no less a sensation in Russia than in Germany. Like the works of Feuerbach, it was never published legally in pre-Soviet Russia; but beginning about 1859, Russian university students became *samizdat* pioneers in the translation and reproduction of prohibited books. It was *Kraft und Stoff* that the ‘nihilist’ younger generation in Ivan Turgenev’s novel *Otsy i deti (Fathers and Sons)* (1862) recommended to the ‘fathers’.

These Russian materialists made little distinction between the views of Feuerbach and the ‘scientific materialists’, whose impact on most of them was concurrent. Like Feuerbach they often referred to themselves as ‘realists’ rather than ‘materialists’, but this was at least in part owing to the fact that the typical Russian censor found ‘realism’ less alarming than ‘materialism’. They appear to have regarded the two terms as synonymous, and they looked upon the intellectual movement from Feuerbach to Büchner, Moleschott and Vogt not (as some critics did) as a degeneration of philosophical materialism but as the productive elaboration of a common philosophical core. Chernyshevskii singled out Feuerbach for special praise, but he never explicitly criticized the later thinkers or pointed to differences between their outlook and Feuerbach’s. Pisarev enthusiastically endorsed the views of Büchner and company, but without rejecting Feuerbach. Among Russians who developed materialist views in ‘the 1860s’, only Bakunin (writing abroad, apart from the active domestic scene) expressed reservations about the scientistic extremes of materialist thought.

The philosophical manifesto of ‘1860s’ materialism - Chernyshevskii’s essay ‘Antropologicheskii printsip v filosofii’ (‘The Anthropological Principle in Philosophy’) (1860) - is sometimes considered a Russian popularization of the ideas of Feuerbach. Much of its content is indeed reminiscent of Feuerbach, but it is also reminiscent of Büchner, and in fact Chernyshevskii’s central idea of the organic connection between all human activity and an integral, physical human nature was already expounded in his diary in 1848, before he had read Feuerbach, not to mention Büchner. Others have pointed to La Mettrie and Holbach (especially the latter’s *Système de la nature*) as Chernyshevskii’s sources. In the end, specific influences on particular works of Chernyshevskii or the other Russian materialists cannot be pinpointed. All of them were stimulated by Feuerbach, impressed by the further advances of the German ‘scientific materialists’, influenced directly or indirectly by various thinkers of the French Enlightenment (Chernyshevskii, for one, was fascinated by the figure and the thought of Rousseau); but they were also guided by their own reactions both to modern European philosophy and to the social and intellectual realities of their immediate Russian environment.

2 Philosophical content

The actual content of the ‘materialism’ preached by the radicals of ‘the 1860s’ is not always clear. As indicated, they often avoided the term itself for reasons of censorship, and when they used it they often did so without delineation of its scope. At the same time, they did subscribe to a loose constellation of ideas that can be identified as a materialist philosophical programme. Its fullest legal expression in Russia came in the published writings of Chernyshevskii, Sechenov and Pisarev (especially Chernyshevskii’s ‘Antropologicheskii printsip v filosofii’); more explicit presentation of these ideas may be found in some unpublished writings such as a series of letters Chernyshevskii wrote from his Siberian exile and a number of essays by Bakunin published abroad.

The clearest and most succinct expression of the materialists’ ontology was provided by Chernyshevskii in a letter from Siberia: ‘That which exists is matter. Matter has properties. The manifestations of properties are forces. What we call laws of nature are the modes of action of forces’ (see Scanlan 1970: 78). With this basic outlook and with its most immediate implications, all the Russian materialists of ‘the 1860s’ would agree. Those implications include, first, the ontological thesis that nothing immaterial, such as a supernatural supreme being or an immortal spiritual soul, exists; second, the epistemological thesis that only empirical investigation, not faith or pure reason, can provide knowledge; and third, the reductionist thesis that all human functions or ‘forces’ (including of course what we call mental operations) are properties of matter.

Because outright denial of God’s existence or rejection of faith as a source of knowledge could not readily be camouflaged to avoid censorship, the attention of Chernyshevskii, Sechenov and others in their works published in Russia in ‘the 1860s’ was directed primarily towards establishing the reductionist thesis - that is, towards

demonstrating that all human functions, from the most 'animal' to the most refined, are materially based and can be exhaustively comprehended by the natural sciences. Chernyshevskii's apparent rambling in 'Antropologicheskii printsip v filosofii' is actually a sustained defence of this thesis, following two complementary lines of argument: that other animals possess all the traits sometimes thought to be restricted to man, and that human behaviour is explicable solely and completely in the same physiological and ultimately chemical terms used to explain processes in the 'lower' orders of nature (Chernyshevskii implies, for example, that because thinking can be reduced to processes of sensation, which is a form of assimilation comparable to digestion, thinking is a chemical process like digestion). The physiologist Sechenov's contribution to this argument is evident from the alleged subtitle (struck out by the censors) of his work *Refleksy golovnogo mazga (Cerebral Reflexes)* (1863): 'An Attempt to Reduce the Mode of Genesis of Psychical Phenomena to Physiological Bases'. Pisarev contributed some of the more imaginative applications of the reductionist thesis, such as his contention that the intellectual vitality of eighteenth-century Europe was attributable to the introduction of the stimulants tea and coffee.

A corollary of the reductionist approach is that the laws of nature apply to acts of the human will just as they do to all other natural 'forces', and this determinist thesis is vigorously championed by Chernyshevskii, Sechenov and Bakunin. Pisarev, on the other hand, offers an inconsistent mixture of materialistic reductionism and 'subjectivity': he attributes an undefined but supremely important 'individual autonomy' to human beings. Bakunin, too, is concerned to retain a place for human freedom in a deterministic universe, but he does so by locating 'freedom' in the conscious awareness that one is determined *only* by natural laws and not by the will of another; thus 'materialism denies free will and ends in the establishment of liberty' (Bakunin [1870-1] 1970: 48).

Their determinism did not prevent most of the materialists of 'the 1860s' from espousing an ethical theory, despite their expressed abhorrence of 'morality' and 'ideals'. Chernyshevskii and Pisarev, in particular, advanced a form of ethical egoism, holding that people ought to act in accordance with their own best interests or true needs. This theory was said to be 'scientific' because it was based on the elementary truth of *psychological* egoism - that is, on the supposed 'natural law' that people invariably *do* act in accordance with what they *think* is their own best interest, with their *perception* of their needs. The task, then, is simply to bring perceptions of needs into line with genuine needs and provide social arrangements for their satisfaction; once people are shown what their true needs really are, and are allowed to pursue them, psychological egoism guarantees that they will do so. The materialists were not worried that a society of perfect egoists would be chaotic or conflictual, because they were convinced that the true, 'natural' needs of all people are harmonious and mutually reinforcing. Hence 'rational egoism', as they called it, would coincide in practice with altruism.

In its most general terms, the social ideal of all these thinkers, including Bakunin, was a society consisting of institutions that allowed the expression of 'natural' human needs rather than generating 'false' or 'artificial' needs such as acquisitiveness and hostility. Because existing institutions were so distant from this ideal, so 'unnatural', an initial posture of revolutionary destruction was called for, expressed most vehemently by Pisarev when he wrote: 'What can be smashed should be smashed. What withstands the blow is fit to survive. What flies into pieces is rubbish. In any case, strike out right and left; no harm can come of it' (see Edie *et al.* 1965: vol. 2, 65). The exact contours of what was expected to survive were never fully elaborated, though it was widely assumed that the society attuned to people's true needs would be secular, socialist and non-authoritarian (to the point of anarchism, in the case of Bakunin).

An important place in the materialists' worldview was occupied by their philosophy of art. This was the first element of their outlook to receive broad public attention after the publication of Chernyshevskii's essay 'The Aesthetic Relation of Art to Reality' in 1855. In opposition to the prevailing idealist theories, Chernyshevskii argued that the purpose of art is simply to reproduce reality critically - that is, to portray what exists in such a way as to explain it, identify its shortcomings and project a more desirable future, all in the service of true human needs. The notion that art is subordinate to life and is justified only to the extent that it contributes to social progress was carried to an extreme by Pisarev, who under the banner of 'the destruction of aesthetics' rejected almost all art of the past on the ground that it catered to false, artificial needs.

3 Sociocultural significance

The Russian materialism of 'the 1860s' is less important for the philosophical content of its ideas than for their influence on Russian society and culture. Materialism in Russia, as it was in France in the eighteenth century and

in Germany around 1848, was closely allied with the revolutionary movement. It opposed, in the words of T.G. Masaryk, both 'theology and theocracy' - both God and the autocratic state ruled in God's name (Masaryk [1913] 1919 vol. 2: 48). It offered not merely an alternative philosophical perspective but a system of values and purposes that were radically different from traditional attitudes and that required the sweeping rejection of existing institutions. The challenge to construct a new life both personally and socially was taken up by throngs of restive Russians, most of them young and many with little interest in philosophy. Called 'nihilists' because of their seemingly total denial of standards of thought and behaviour, they were in fact dogmatically committed to their own antireligious, antitraditionalist and anti-authoritarian standards.

By 1861 the radicals were disappointed by the slow pace of reform, and especially by the illiberal terms of the emancipation of the serfs in that year. Disturbances were answered with intensified repression; both Chernyshevskii and Pisarev were arrested and imprisoned in 1862. Earlier hopes of change from above grew into a determination to bring change about by force, and a 'nihilist' student, Dmitrii Karakozov, effectively ended the relatively open decade of 'the 1860s' by his unsuccessful attempt on the life of Alexander II in 1866. Thereafter, Russian materialism evolved into a philosophy of revolutionary activism, soon with Marxist overtones. A disciple of Chernyshevskii named Pëtr Nikitich Tkachëv (1844-86 NS), one of the first Russian writers to come under the influence of Marx, brought elements of Marxist historical materialism into his literary criticism in the mid-1860s; subsequently, writing abroad, Tkachëv became an extreme advocate of revolutionary terrorism and the violent seizure of power.

Among the enduring cultural influences of the Russian materialists' worldview was its impact in the field of literature. The Russian tradition of 'civic criticism', inaugurated by Vissarion Belinskii, was developed further by Chernyshevskii, Pisarev, Dobroliubov and others, in part because the discussion of literature offered them a relatively protected forum for the social critique they could not publish directly. Creative literature, too, felt the powerful impact of 'nihilism'. The very term was popularized by Turgenev in *Otsy i deti (Fathers and Sons)*, in which the character Bazarov is the quintessential '1860s' materialist, bent on saving the world through studying the physiology of frogs. A more sympathetic, if aesthetically less successful, portrayal of the 'new people' of the day was presented in Chernyshevskii's own widely read novel, *Chto Delat'? (What Is to Be Done?)* (1863). The deepest literary impact of the movement, albeit a negative one, came in the works of Fëdor Dostoevskii. His *Zapiski iz podpol'ia (Notes From Underground)* (1864) is a frontal assault on the determinism and 'rational egoism' of Chernyshevskii, and all of Dostoevskii's great novels deal in one way or another with the materialist outlook and what Dostoevskii took to be its pernicious implications; in *Besy (The Possessed)* (1871-2) he paints a highly unflattering portrait of 'nihilist' revolutionaries.

Although the writings of the materialists of 'the 1860s' inspired one of the liveliest intellectual debates in nineteenth-century Russia, the debate did not result in the philosophical refinement of their materialist outlook (except to some degree in Chernyshevskii's unpublished and publicly unknown letters from Siberia of 1876-8). In 1861 and 1862, the religious philosopher Pamfil Danilovich Iurkevich (1826-74) published a series of essays containing careful and philosophically sophisticated criticism of materialism and especially of Chernyshevskii's 'Antropologicheskii printsip v filosofii'. Because of censorship, however, Chernyshevskii could not reply substantively to the charges against him; his side of the philosophical argument was effectively proscribed, and he and his supporters resorted to invective and crude personal attacks on Iurkevich. The only strictly philosophical legacy of the materialists came in the form of their influence on Russian Marxism. Georgii Plekhanov and Vladimir Lenin, the two thinkers most responsible for the development of Marxism in Russia, credited Chernyshevskii with having, respectively, 'massive' and 'overwhelming' influence on them (see Scanlan 1970: 65). During the communist period of Russian history, the principal 'nihilist' theoreticians were officially lionized under the designation 'Russian revolutionary democrats' and were called the most important materialist thinkers in the history of philosophy before Marx.

Russian philosophy

Russian thought is best approached without fixed preconceptions about the nature and proper boundaries of philosophy. Conditions of extreme political oppression and economic backwardness are not conducive to the flowering of philosophy as a purely theoretical discipline; academic philosophy was hence a latecomer on the Russian scene, and those (such as the Neo-Kantians of the end of the nineteenth century: see Neo-Kantianism, Russian) who devoted themselves to questions of ontology and epistemology were widely condemned for their failure to address the country's pressing social problems. Since Peter the Great's project of Westernization, Russian philosophy has been primarily the creation of writers and critics who derived their ideals and values from European sources and focused on ethics, social theory and the philosophy of history, in the belief that (as Marx put it in the first 'Thesis on Feuerbach') philosophers had hitherto merely interpreted the world: the task was now to change it. This passionate social commitment generated much doctrinaire fanaticism, but it also inspired the iconoclastic tendency made philosophically respectable by Nietzsche: the revaluation of values from an ironic outsider's perspective. The principal contribution of Russian thinkers to world culture has so far consisted not in systems, but in experiments in the theory and practice of human emancipation. Some of these led to the Russian Revolution, while others furnished remarkably accurate predictions of the nature of utopia in power. Like Dostoevskii's character Shigalëv who, starting from the ideal of absolute freedom, arrived by a strict logical progression at the necessity of absolute despotism, Russian philosophers have specialized in thinking through (and sometimes acting out) the practical implications of the most seductive visions of liberty that Europe has produced over the last 200 hundred years.

1 The development of Russian philosophy

What Berdiaev called the 'Russian Idea' - the eschatological quest that is the most distinctive feature of Russian philosophy - can be explained in terms of Russian history. The Mongol yoke from the twelfth to the fourteenth century cut Russia off from Byzantium (from which it had received Christianity) and from Europe: it had no part in the ferment of the Renaissance. Its rise as a unified state under the Moscow Tsardom followed closely on the fall of the Orthodox Byzantine Empire, and the emerging sense of Russian national identity incorporated a messianic element in the form of the monk Philotheus' theory of Moscow as the 'Third Rome', successor to Rome and Constantinople as guardian of Christ's truth in its purity (see Medieval philosophy, Russian). 'There will not be a fourth', ran the prophecy: the Russian Empire would last until the end of the world. Russian thought remained dominated by the Greek patristic tradition until the eighteenth century, when the Kievan thinker Skovoroda (sometimes described as Russia's first philosopher) developed a religious vision based on a synthesis of ancient and patristic thought. He had no following; by the mid-century Russia's intellectual centre was St Petersburg, where Catherine the Great, building on the achievements of her predecessor Peter, sought to promote a Western secular culture among the educated elite with the aid of French Enlightenment ideas. But representatives of the 'Russian Enlightenment' were severely punished when they dared to cite the *philosophes'* concepts of rationality and justice in criticism of the political status quo (see Enlightenment, Russian). The persecution of advanced ideas (which served to strengthen the nascent intelligentsia's self-image as the cultural and moral leaders of their society) reached its height under Nicolas I (1825-55), when philosophy departments were closed in the universities, and thought went underground. Western ideas were the subject of intense debate in small informal circles of students, writers and critics, the most famous of which in Moscow and St Petersburg furnished the philosophical education of such intellectual leaders as the future socialists Herzen and Bakunin, the novelist and liberal Ivan Turgenev, the literary critic Belinskii (from whose 'social criticism' Soviet Socialist Realism claimed descent), and the future Slavophile religious philosophers Kireevskii and Khomiakov (see Slavophilism). As a critic has noted: 'In the West there is theology and there is philosophy; Russian thought, however, is a third concept'; one which (in the tsarist intellectual underground as in its Soviet successor) embraced novelists, poets, critics, religious and political thinkers - all bound together by their commitment to the goals of freedom and justice.

In the 1830s these beleaguered individuals encountered German Idealism: an event of decisive significance for the future development of Russian thought. The teleological structures of idealist thought provided Russian intellectuals with a redemptive interpretation of their conflicts and struggles as a necessary stage in the dialectical movement of history towards a transcendent state of harmony. Idealism (notably in its Hegelian forms: see

Hegelianism, Russian) left its mark on the vocabulary of subsequent Russian philosophy, but its principal legacy was the belief, shared by the vast majority of Russian thinkers, that an ‘integral worldview’, a coherent and unified vision of the historical process and its goal, was the essential framework both for personal moral development and social theorizing. The question of history’s goal became a matter for intense debate among the intelligentsia with the publication in 1836 of Chaadaev’s ‘Philosophical Letter’, which posed Russia’s relationship to the West as a central philosophical problem, maintaining that Russia’s historical separation from the culture of Western Christianity precluded its participation in the movement of history towards the establishment of a universal Christian society. Chaadaev’s version of the march of progress was much indebted to French Catholic conservatism, while the nationalist riposte to his ideas drew heavily on the Romantics’ critique of the Age of Reason and Schelling’s organic conception of nationhood: the Slavophiles held that Western culture was in a state of terminal moral and social decline, suffering from an excess of rationalism, which had led to social atomization and the fragmentation of the individual psyche (see Chaadaev, P.I.; Schellingianism). These divisions could be healed only by religious faith in its purest form, Russian Orthodoxy, whose spirit of organic ‘togetherness’, uncontaminated by Western rationalism, they presented as a model for Russian society and a beacon for mankind. They thereby laid the foundations of a distinctively Russian tradition of cultural and religious messianism which includes Dostoevskii’s political writings, the Pan-Slavist and Eurasian movements (see Dostoevskii, F.M.; Pan-Slavism and Eurasian movement), and the apocalyptic vision of Berdiaev, whose philosophy was highly popular among the Soviet underground.

Secular and Westernist thinkers tended to be scarcely less messianic in their response to Chaadaev’s pessimism. The first philosophers of Russian liberalism (see Liberalism, Russian) interpreted their country’s past and future development in the light of Hegel’s doctrine of the necessary movement of all human societies towards the incarnation of Reason in the modern constitutional state, while the Russian radical tradition was shaped successively by the eschatological visions of the French utopian socialists, the Young Hegelians and Karl Marx. Herzen defined the distinctive characteristic of Russian radical thought as the ‘implacable spirit of negation’ with which, unrestrained by the European’s deference to the past, it applied itself to the task of freeing mankind from the transcendent authorities invented by religion and philosophy; and the radical populist tradition that he founded argued that the ‘privilege of backwardness’, by permitting Russia to learn both from the achievements and the mistakes of the West, had placed it in the vanguard of mankind’s movement towards liberty.

Russian religious philosophers tended to see themselves as prophets, pointing the way to the regeneration of human societies through the spiritual transformation of individuals. Vladimir Solov’ëv (regarded by many Russians as their greatest philosopher) believed that his country’s mission was to bring into being the Kingdom of God on Earth in the form of a liberal theocracy, which would integrate knowledge and social practice and unite the human race under the spiritual rule of the Pope and the secular rule of the Russian tsar. His metaphysics of ‘All-Unity’ was a dominant force in the revival of religious and idealist philosophy in Russia in the early twentieth century, inspiring an entire generation of thinkers who sought to reinterpret Christian dogma in ways that emphasized the links of spiritual culture and religious faith with institutional and social reform, and progress in all other aspects of human endeavour. Among them were leading Russian émigré philosophers after 1917, such as Semën Frank, Bulgakov (who sought to create a new culture in which Orthodox Christianity would infuse every area of Russian life), Berdiaev (who was strongly influenced by the messianic motifs in Solov’ëv), and Hessen, who offered a Neo-Kantian and Westernist interpretation of the notion of ‘All-Unity’. A number of émigré philosophers (notably Il’in and Vysheslavtsev) interpreted Bolshevism as the expression of a spiritual crisis in modern industrialized cultures. Many blamed the Russian Revolution on infection from a culturally bankrupt West which (echoing the Slavophiles, Dostoevskii and Leont’ev) they presented as corrupted by rationalism, positivism, atheism and self-centred individualism (although few have gone as far as the fiercely polemical Losev who, up until his death in the Soviet Union in 1988, maintained that electric light expressed the spiritual emptiness of ‘Americanism and machine-production’). Most maintained a historiosophical optimism throughout the catastrophes of the first half of the twentieth century, which Berdiaev saw as a precondition for messianic regeneration, while Hessen believed that religious and cultural values would emerge triumphant from the carnage in a dialectical *Aufhebung*.

2 Major themes in Russian philosophy

The main impetus of Russian philosophy has always been towards the future, as its representatives strained to

discern the features of the 'new man' (the term favoured by the left from the 1860s, with the addition of the adjective 'Soviet' after 1917), or the 'integral personality', as Slavophiles and neo-idealists preferred to describe the individual who would one day be free from the cognitive and moral defects that had hitherto prevented mankind from realizing its potential. The nature of these flaws and the specifications of the regenerated human being were the subject of bitter disputes between rival movements. Even on the left, models of the 'new man' varied widely, from the narrow rationalist who was the ideal of the 'nihilists' of the 1860s (see Nihilism, Russian; Russian Materialism: 'the 1860s') and subsequently of Lenin and Plekhanov, to Bakunin's eternal rebel, who would embody the spontaneous spirit of freedom in defiance of all established authorities and orders. At the end of the nineteenth century, in the cultural ferment produced by new movements in philosophy and the arts emanating from the West, radical thinkers began *en masse* to renounce their predominantly rationalist models of the individual and society (see Russian Religious-Philosophical Renaissance). Nietzsche's Superman had a pervasive influence on the ensuing 'revaluation of values', undertaken with the aim of formulating moral and social ideals that would embrace the manysidedness of human creativity (see Nietzsche: impact on Russian thought). Some radical philosophers (such as Berdiaev and Frank), in the process of moving from Marxism to neo-idealism, sought to reconcile Nietzsche's aesthetic immoralism with Christian ethics, while the 'Empiriocriticist' group of Bolsheviks attempted to inject Russian Marxist philosophy with an element of heroic voluntarism by synthesizing it with Nietzschean self-affirmation and the pragmatism of Ernst Mach (see Russian Empiriocriticism). Nietzschean influences combined with the mechanistic scientism of Soviet Marxism in the Soviet model of the 'new man' (whose qualities Lysenko's genetics suggested could be inherited by successive generations). In the post-Stalin 'thaw' some Soviet philosophers, including Il'enkov and Mamardashvili, began a critical rereading of Marx's texts from an anthropocentric standpoint which emphasized the unpredictable and limitless potential of human consciousness (see Marxist philosophy, Russian and Soviet).

This open-ended view of progress (officially encouraged in the Gorbachev period) is uncommon in Russian philosophy, where epistemological scepticism is more often to be encountered in uneasy combinations with eschatological faith. Like other rootless groups, Russian intellectuals were drawn to compensating certainties that seemed capable of resisting their corrosive critique. The radical humanism of much Russian thought placed it at the forefront of the developing critical insistence on the context-dependent nature of truth; but many thinkers who attacked the claims of systems and dogmas to encompass and explain the experience and creative needs of living individuals in specific historical contexts, nevertheless retained a belief in a final, ideal state of being in which the fragmentation of knowledge would be overcome and all human purposes would coincide: a condition for whose principles some looked to science, others to religious revelation. The nihilists, who rejected metaphysics and all that could not be proven by rational and empirical methods, fervently believed that progress would inevitably lead to the restoration of a natural state of harmony between the individual and society. The empiriocriticist movement within Russian Marxism opposed the idolatry of formulas with the claim that experience and practice were the sole criteria of truth, but the group's leading philosopher, Bogdanov, looked forward to a metascience that would unify the fragmented world of knowledge by reducing 'all the discontinuities of our experience to a principle of continuity', predicting that under communism, when all would share the same modes of organizing experience, the phenomenon of individuals with separate mental worlds would cease to exist. Solov'ëv's pervasive influence on subsequent Russian religious idealism owed much to the charms of his vision of 'integral knowledge' and 'integral life' in an 'integral society'. Religious and socialist motifs were combined in some visions of an earthly paradise, such as Bulgakov's 'Christian Socialism', or Gorkii's and Lunarcharskii's creed of 'God-building', which called for worship of the collective humanity of the socialist future. In the revolutionary ferment of the first two decades of the twentieth century many religious and radical philosophers, together with Symbolist writers and poets, envisaged the leap to the harmonious future in apocalyptic terms: the novelist and critic Merezhkovskii prophesied the coming of a 'New Christianity' which would unite Christian faith with pagan self-affirmation in a morality beyond good and evil (see Nietzsche: impact on Russian thought §1; Russian Religious-Philosophical Renaissance §§3-4). In the aftermath of 1917 some thinkers (notably Berdiaev and members of the Eurasian movement) found consolation in apocalyptic fantasies of a new light from the East shining on the ruins of European culture.

Herzen memorably ascribed such doctrinaire utopianism to the Russian tendency to march 'in fearless ranks to the very limit and beyond it, in step with the dialectic, but out of step with the truth'. The most original and subversive Russian thinker, he was the first of a significant minority who directed the iconoclastic thrust of Russian

philosophy against all forms, without exception, of messianic faith. Contending that there was no basis in experience for the belief in a purposeful universe on which the great optimistic systems of the nineteenth century were built, he urged his contemporaries to adapt their categories to the flow of life, to accept (and even welcome) the dominant role of contingency in human existence, on the grounds that individual freedom and responsibility were possible only in an unprogrammed world. Herzen's critique of the claims of metaphysical systems to predict or regulate the course of history was echoed by the 'subjective sociology' developed by Mikhailovskii and Lavrov in opposition to the deterministic scientism of the dominant Russian radical tradition. Tolstoi pointed to the chanciness of life and history in order to demonstrate the inadequacy of all attempts to formulate general rules for human societies; Dostoevskii confronted the systematizers with the lived experience of human freedom as the ability to be unpredictable; in their symposium of 1909 (frequently cited in the West as a pioneering analysis of the psychology of political utopianism) the neo-idealists of the *Signposts* movement explored the ways in which obsession with an ideal future impoverishes and distorts perception of the historical present (see Signposts movement).

Under the Soviet system a few representatives of this anti-utopian tradition ingeniously evaded the pressure on philosophers (backed up by the doctrine of the 'partyness' of truth - see Partiinost') to endorse the official myths of utopia in power. The history of the novel form was the vehicle for Bakhtin's reflections on the 'unfinalizability' of human existence (see Bakhtin, M.M.); similar insights were expressed by the cultural-historical school of psychology established by Vygotskii, who drew on Marx to counter the mechanistic determinism of Soviet Marxist philosophy with a view of consciousness as a cultural artefact capable of self-transcendence and self-renewal. In the 1960s Soviet psychologists and philosophers such as Il'enkov helped to revive an interest in ethics with their emphasis on the individual as the centre of moral agency, while in its historical studies of culture as a system of semiotic signs, the Moscow-Tartu school brought a richly documented and undoctrinaire approach to important moral and political topics.

The insights of some of these individuals and movements into the attractions and delusions of utopian thought are lent added conviction by their own often spectacularly unsuccessful efforts to overcome what Nietzsche called 'the craving for metaphysical comfort'. Tolstoi was torn all his life beween his pluralist vision and his need for dogmatic moral certainties, while Dostoevskii in his last years preached an astonishingly crude variety of religio-political messianism. The humanism of some later religious philosophers (including the *Signposts* authors Berdiaev and Bulgakov) is hard to reconcile with their eschatological impatience.

Russian Religious-Philosophical Renaissance

The Russian Religious-Philosophical Renaissance was created by lay intellectuals who found rationalism, positivism and Marxism inadequate as explanations of the world or guides to life. They were deeply engaged in finding solutions to the problems of their time, which they saw as moral or spiritual/cultural in nature. Some were already devout Christians; others became so later on. Collectively known as the God-seekers, they propounded their ideas in numerous publications and in the Religious-Philosophical Societies of St Petersburg and Moscow. The meetings of these societies attracted capacity audiences and helped disassociate religion from reaction. Branches were founded in Kiev and Vladimir. The founding members were mainly Symbolist writers and idealist philosophers. Both groups sought a new understanding of Christianity, but the Symbolists emphasized psychological and literary/aesthetic issues and the idealists focused on ethics, epistemology and political and social reform. The Revolution of 1905 was a watershed for all of them. The hitherto apolitical Symbolists perceived it as the start of the apocalypse and championed anarchistic political doctrines. The idealists continued to champion reform. After the revolution, some of them called for a new religious intelligentsia that respected culture and the creation of wealth, spiritual/cultural and material. Both groups began to talk about national identity and destiny. The Bolshevik Revolution signalled the end of the Religious-Philosophical Renaissance. In 1922-3, over 160 non-Marxist intellectuals were forced into exile, where they continued their work. Inside Russia private religious-philosophic study circles carried on illegally.

The Religious-Philosophical Renaissance had a profound impact on Russian thought and culture. It inspired attempts to ground metaphysics and political doctrines in Christianity, demands for church reform, visions of a new culture, sophiology, religious existentialism and new interpretations of Orthodox ritual and dogma. Its proponents made people aware of the needs of the 'inner man', the soul or the psyche, and the importance of art and myth. Symbolism became the dominant aesthetic, shaping literature, poetry, painting and theatre. Theorists of Symbolism tried to make it the basis of a new cosmological worldview. The Religious-Philosophical Renaissance was rediscovered by Soviet intellectuals in the 1960s, nourished the dissident movement from then on, and is extensively discussed in Russia today.

1 The leading figures

The leading figures of the Religious-Philosophical Renaissance opted for spirituality over materialism, art over utility, and mysticism or idealism over positivism. Focusing on spiritual, psychological and cultural transformation rather than social engineering, they debated issues such as the relevance of Christianity to the political and social order, Christian attitudes to sex, philosophy and the law, art and cognition, the intelligentsia and the people, and the essence of 'Russianness'. Although they argued about the same problems and were occupied in a common search for new values, their approaches were somewhat different so that in essence there were two groups. The first group included the Symbolist writers Dmitrii Merezhkovskii (1865-1941), his wife Zinaida Gippius (1869-1945), Dmitrii Filosofov (1872-1940), Nikolai Minskii (real name Vilenkin, 1855-1937), Andrei Belyi (1880-1934), Aleksandr Blok (1880-1921), Vyacheslav Ivanov (1866-1949) and Aleksei Remizov (1877-1957). Associated with them were Fëdor Sologub (Teternikov, 1863-1927), Vasilii Rozanov (1856-1919) and Aleksandr Benois (1870-1960), of the journal *Mir iskusstva (The World of Art)* (1899-1904). The Symbolist writer Valerii Briusov (1873-1924) was not a God-seeker, but he used their terminology and published their works in his journal *Vesy (The Balance)* (1904-9). Influenced by Nietzsche and Wagner, and in some cases by Solov'ëv, this group was primarily concerned with art, self-expression, and personal freedom (see Nietzsche: impact on Russian thought; Solov'ëv, V.S.). Once they became politicized most of them favoured anarchism but, except for the mandate to feed the hungry, they ignored economic issues and were indifferent or hostile to industrialization. The second group included the contributors to the symposium *Problemy idealizma (Problems of Idealism)* (1902), Pavel Novgorodtsev (1866-1924), Sergei Trubetskoi (1861-1905), Evgenii Trubetskoi (1863-1920), Nikolai Berdiaev (1847-1948), Sergei Bulgakov (1871-1944), Semën Frank (1877-1950), and Pëtr Struve (1870-1944). Influenced by Neo-Kantian idealism and by theories of natural law, they advocated economic growth if it be guided by ethical considerations, self-discipline and a sense of responsibility for one's actions (see Natural law; Neo-Kantianism, Russian §5). The idealists were also influenced by Solov'ëv, but they highlighted different writings. Neither group was homogeneous. The Trubetskoi brothers objected to the Nietzscheanism of Berdiaev's and Frank's essays in *Problemy idealizma*. Belyi and Rozanov defended the symposium *Vekhi (Signposts)* while Merezhkovskii attacked

it (see Signposts movement). Berdiaev and Bulgakov ultimately rejected Kant. Ivanov, a proponent of Mystical Anarchism during the Revolution of 1905, contributed to the idealists' anti-Bolshevik symposium *Iz glubiny (Out of the Depths)* (1919). Another leading figure, the philosopher Lev Shestov (1866-1938) was neither a Symbolist nor an idealist. The philosopher-priest Pavel Florenskii (1882-1937) was a God-seeker in the early twentieth century.

2 The Religious-Philosophical Society meetings

The Religious-Philosophical Society of St Petersburg was founded by Merezhkovskii, Gippius and Filosofov. After obtaining permission from the Overprocurator of the Holy Synod Konstantin Pobedonostsev, they held the first meeting in November 1901. Bishop Sergei (Stragorodskii), Rector of the Theological Academy of St Petersburg (university level), was the President and a different Bishop Sergei, Rector of the Theological Seminary (secondary-school level) was Vice-President. Also presiding over the meetings were V.M. Skvortsov, editor of *Missionerskoe obozrenie (Missionary Survey)*, Merezhkovskii, Gippius, Filosofov, Minskii, Benois, Valentin Ternavtsev, the secretary of the Holy Synod, and two professors from the Theological Academy, Anton Kartashev and Vasilii Uspenskii.

At the meetings a paper was read and discussed; the discussion sometimes continued for several sessions. The minutes were published serially in the Merezhkovskii's revue *Novyi put' (New Path)* (1902-4). Ternavtsev's keynote address, 'The Clergy and the Intelligentsia', was a call for their reconciliation. To combat atheistic socialism, he argued, the Church must find Christian solutions to the problems of everyday life, not ignore them. Several sessions were devoted to Merezhkovskii's studies of the life and work of Tolstoi, Dostoevskii and Gogol' and their contemporary relevance. Sessions devoted to the relation of church and state, to Christian attitudes to sex, and to whether or not Orthodox dogma is complete were particularly stormy. Outraged at the excommunication of Tolstoi by the Holy Synod in 1901, Merezhkovskii called for a re-opening of the issue of the Synod's authority and charged that by excommunicating Tolstoi it had alienated everyone who believes in freedom. Father Mikhail Semёnov's paper on Christian marriage, which maintained that sexual desire must be expressed only in marriage and for the purpose of begetting children, inaugurated a particularly stormy series of sessions on 'the mystery of the flesh'. Rozanov argued that the sexual act is itself holy and denied the right of the Church to regulate marriage and divorce (see Rozanov §2). Merezhkovskii talked about 'holy flesh', the permeation of flesh by spirit. Uspenskii's paper on Christian dogma provoked challenges to the authority and position of the clergy as its sole interpreter. Some members denied the need for any dogma at all. Others maintained that new dogma was necessary and that laymen must share in its creation. In April 1903 Pobedonostsev ordered that the society be closed down. From his point of view the 'mission to the intelligentsia' had failed. But he could not surpress the rethinking of Orthodoxy that the society had stimulated. The meetings, twenty-two in all, provided a platform for new religious views and forced clergymen to defend their positions. This hitherto unprecedented spectacle encouraged more challenges to clerical authority and, during the Revolution of 1905, demands for a Church council (*Sobor*). The St Petersburg society was revived in 1907 but without the clergy.

The Solov'ёv Moscow Religious-Philosophical Society (1906-17) was founded by Berdiaev, Bulgakov, Florenskii, Vladimir Ern (1881-1917) and others. Social and political issues dominated the agenda, as they did that of the revived St Petersburg society (sometimes the same paper was presented to both), but issues such as Christian asceticism and church reform were also on the agenda. In 1906, members or former members of these societies formed two short-lived groups: The Group of Thirty-Two, priests who demanded various reforms, and the Christian Brotherhood of Struggle, which preached a kind of liberation theology (see Liberation theology). Bulgakov attempted, unsuccessfully, to form a Union of Christian Politics.

3 Merezhkovskii's 'new religious consciousness'

Merezhkovskii was the dominant figure in the original St Petersburg society, which he founded to proselytize his 'new religious consciousness' and his quest for a new Christianity. In the 1890s, he had initiated the Symbolist movement and popularized Nietzsche's thought. In the early twentieth century, he shaped the framework of the Religious-Philosophical Renaissance and, as he had done for Symbolism, defined the issues which others treated in a more sophisticated manner. He propounded his views in a trilogy of historical novels (about Julian the Apostate, Leonardo da Vinci and Peter the Great), in studies of Tolstoi, Dostoevskii and Gogol', and in numerous articles about current social, political, cultural and religious issues.

Merezhkovskii taught that ‘historical Christianity’ (Christianity as taught by the churches) was becoming obsolete; he expected a New Revelation, a Third Testament, to be granted by Christ himself, whose Second Coming was imminent. At that point, the joyousness of Jesus’ Resurrection will prevail over the suffering of Golgotha and the hitherto proscribed pagan values of sensuality, worldly beauty, and self-affirmation will be sanctified. Russians were to prepare for His Advent by studying all religions and by joining Merezhkovskii in his religious quest. At first Merezhkovskii envisaged a new church developing out of the Orthodox Church. Later on, he advocated a complete break with it.

When Merezhkovskii began to preach his ‘new religious consciousness’, religion was so unpalatable to the intelligentsia that he found it necessary to expend a great deal of energy arguing that people need religion and that surrogate religions - whether scientism, aestheticism or socialism - were inherently unsatisfactory. Religion, he said, begins when man realizes that he is mortal. Therefore, personal immortality, the resurrection of both the body and the soul, is the heart of religion. All other aspects, including ethics, are mere by-products. Faith nourishes the soul just as food nourishes the body. Individuals are part of a culture shaped by religious faith; when the faith breaks down the culture loses its unity and individuals are left isolated and alone. The effects of spiritual deprivation are nameless fear and loneliness, and the sufferers do not even know what ails them. Western civilization was nourished by the sap of Christianity, but rationalism has destroyed that sap. Only a ‘Christian renaissance’ would enable contemporary humankind to overcome despair and decadence. Merezhkovskii also argued that Nietzsche’s objections to Christianity applied only to ‘historical Christianity’. True Christianity is not life-denying; it is the supreme affirmation of life. Christianity does not teach a slave morality but a new morality beyond conventional notions of good and evil. And Jesus Christ is the Superman that Nietzsche sought in vain.

Previously, in his essay ‘Pushkin’ (1896), Merezhkovskii had argued that Christianity and paganism (really Nietzscheanism) represented the ‘truth of heaven’ (personal immortality and love) and the ‘truth of the earth’ (worldly pleasures) respectively. Each constituted half of a yet unknown greater truth. Merezhkovskii’s search for this truth led him to postulate that the Old Testament was the Revelation of God the Father and the New Testament of God the Son. A Third Revelation will be of the Holy Spirit. In emigration, Merezhkovskii maintained that the Holy Spirit was feminine.

In *Tolstoi i Dostoevskii* (1900-1), written in the first flush of his ‘new religious consciousness’, Merezhkovskii reformulated the ‘two truths’ as polarities *within* Christianity. Comparing the Russian giants with each other and with Nietzsche, Merezhkovskii argued that Dostoevskii represented ‘the spirit’ and Tolstoi represented ‘the flesh’ which ‘historical Christianity’ denied. Merezhkovskii attributed Tolstoi’s asceticism to an unconscious preoccupation with the flesh, accused him of hypocrisy and of a ‘flight from culture’, and claimed that Tolstoi’s real religion was Buddhism. But Merezhkovskii also saw an unconscious ‘pagan holiness’ in Tolstoi’s *The Cossacks* and he praised Tolstoi’s courage in defying the Orthodox Church. Even so, he preferred Dostoevskii, seeing him as the prophet of the spiritualization of the flesh and of a new humanity united by ‘evangelic love’. Even though Dostoevskii was not always faithful to his own insights, even though he had the Grand Inquisitor advocate the slavery of ‘miracle, mystery, and authority’ in *Brat’ia Karamazovy (The Brothers Karamazov)*, Elder Zosima’s message in the same book showed that Dostoevskii anticipated the coming Christ. Merezhkovskii believed that the Grand Inquisitor and Elder Zosima voiced contradictory aspects of Dostoevskii’s incompletely integrated worldview, but that Elder Zosima and his disciple Alësha Karamazov represented Dostoevskii’s truly prophetic insights. A decade later, Merezhkovskii described his attempt to reconcile Christianity and paganism as dangerous heresy. As he distanced himself from Nietzsche, his admiration for Tolstoi grew correspondingly (see Dostoevskii, F.; Tolstoi, L.N.).

To Merezhkovskii, beauty outranked sex as the greatest worldly pleasure and beauty was incarnated in the statues of Venus or Aphrodite that the early Christians destroyed. Hence his objection to Tolstoi’s *Chto takoe iskusstvo? (What is Art?)* (1898), which subjugated art to moralism. In a study of Gogol’ (1903) Merezhkovskii portrayed his confessor, Father Matvei (Konstantinovskii), as the personification of Christian asceticism, and blamed him for Gogol’s ruin. Merezhkovskii’s interpretation of Tolstoi, Dostoevskii and Gogol’ as religious thinkers rather than social critics inspired other ‘religious’ interpretations.

Novyi put’ provided an outlet for other God-seekers. Blok made his debut there. Rozanov had a regular column, as did Bulgakov who came on board with Berdiaev in mid-1904. Ivanov’s influential study, ‘Ėllinskaia religiia

stradaiiushchego Boga' (The Hellenic Religion of the Suffering God) (1904), which treated Dionysus as a precursor of Christ, first appeared in *Novyi put'*. Florenskii published some early articles in it. Berdiaev and Bulgakov became co-editors of its successor journal *Voprosy zhizni (Questions of Life)* (1906), which featured essays by Symbolists and idealists.

During and after the Revolution of 1905, political and other disputes fractured the Symbolist group and created a breach between them and the idealists. Merezhkovskii advocated a 'religious revolution' that would institute the Kingdom of God on Earth and proclaimed that the atheistic intelligentsia, not the Orthodox Church, was the carrier of Christ's message: 'They are not yet with Christ but Christ is with them'. Ivanov supported Mystical Anarchism, a doctrine that advocated the abolition of government, law and morality. Love (*eros*), ritual and myth would be the social cement. The idealists continued to champion reform. Members of both groups predicted that 'Socialism as Religion' would lead to despotism.

4 Symbolism as a worldview

Russian Symbolism was not just an artistic school but a worldview, based on a mystical epistemology which held that the empirical world is but a reflection of a higher reality, and that art, imagination and intuition, rather than reason and science, are the means to new psychological and religious truths. The Symbolists saw themselves as creators of a new culture of freedom, beauty and love, which was opposed in all respects to contemporary materialist and positivist-utilitarian culture, including such 'bourgeois' institutions as constitutions and parliaments.

Basic to Russian Symbolism were the Orthodox concepts of transfiguration and incarnation, and the Orthodox belief that man is called upon to fulfil the divine Plan - to be co-creator with God. Also basic, especially to Ivanov, Belyi and Blok, were Solov'ëv's apocalypticism, and his concepts of all-unity (*vseedinstvo*), Godmanhood (*Bogochelovechestvo*) and Sophia (divine wisdom, the 'eternal feminine', or the World Soul) (see Solov'ëv, V.S. §§1-2). Melding these concepts with ideas derived from Nietzsche, Wagner, Dostoevskii, Fëdorov and occult doctrines, the Symbolists regarded art as a theurgical activity that would transfigure the world and human beings. The poetic word was itself a symbol, bearing the transparent reflection of the eternal in the temporal. The Symbolist poet had a divine mission, the articulation of a new saving word which would generate a new world. Within this broad framework, each Symbolist had special themes. Blok wrote poems to 'the Beautiful Lady' and to 'the Stranger', a fallen Sophia. Ivanov advocated self-transcendence in the mystical ecstasy of the Dionysian rites. Maintaining that poetry requires a special hieratic language, he was interested in the roots of language and the origins of myth and cult. Merezhkovskii opposed all attempts to subvert individual integrity and used language that ordinary people could understand. Belyi tried to make Symbolism the basis of a new religious worldview that encompassed art, philosophy and science. Briusov, however, maintained 'Symbolism was and always wanted to be only art'. He made this statement in 1910, during the 'crisis of Symbolism'. After the crisis, individual Symbolists remained creative but went their separate ways. *Vesy* and *Zolotoe runo (Golden Fleece)* (1906-9) had ceased publication, but they had access to mainstream journals such as *Russkaia mysl' (Russian Thought)* and to a new religious journal *Trudy i dni (Works and Days)* (1912-16).

The Symbolists refused to defer to 'necessity', including the 'laws of nature'. Ivanov titled one of his essays 'On the Non-Acceptance of the World' (after Ivan Karamazov's refusal to accept the world that God has created) and praised 'struggling with God' (*Bogoborchestvo*), by which he meant rejection of that which exists in the name of a higher ideal. Some Symbolists, and Berdiaev, rejected the traditional family (husband, wife, children). They counterposed resurrection to procreation and separated sex from procreation in the hope of breaking the endless cycle of birth and death. Their ideal human being was an androgyne, which implies the end of the sexual act.

The Symbolists' sociopolitical ideal, which they borrowed from the Slavophiles and Solov'ëv, was *sobornost'*, originally an ecclesiastical concept that pertained to the unity of all believers in the mystical body of Christ (see Slavophilism §3). To the Symbolists and to most idealists as well, *sobornost'* connoted a society united by love and common ideals whose members retain their individuality, as opposed to individualism which they rejected as self-affirmation against or apart from society. They also rejected impersonal collectivism.

As the eschatological expectations aroused by the Revolution of 1905 died down, the Symbolists and some idealists condemned the 'pagan' Renaissance and romanticized the medieval West. Ivanov made Dante Alighieri

into a Symbolist and equated Beatrice with Sophia. Paradoxically, the very same people pontificated about Russia's cultural/national identity and destiny. Ivanov tried to articulate the 'Russian Idea' - that which distinguishes Russia from other nations - insisting that it was a Christian idea and that only Christianity could provide the spiritual integration that Russia needed. He urged the intelligentsia to 'descend' to the people in the spirit of Christian humility and self-sacrifice. Merezhkovskii objected to Ivanov's view on various grounds, but he shared Ivanov's belief that Russia stood at a crossroads and must choose between 'the beast' and Christ. Blok began to write about an anthropomorphized Russia, at once mother and wife, and to prophesy the destruction of the Westernized intelligentsia. The latter was also the theme of Belyi's novel *Serebrianyi golub' (The Silver Dove)* (1909), the first of a projected trilogy on the collision of East and West. *Petersburg* (1911) was the second. The third novel, which Belyi never wrote, was to be about the legendary city of Kitezh which sank to the bottom of Lake Svetloiar at the time of the Mongol invasion and would rise at the end of time. Reports at Religious-Philosophical Society meetings included attempts to distinguish between 'nationality', love of one's own land and culture, and aggressive, self-aggrandizing 'nationalism'. Ivanov maintained that the 'sin' of Slavophilism was its inclusion of spiritually extraneous factors such as the state in its metaphysics. He viewed the nations of humanity as members of a cosmic *sobornost'*.

Nevertheless, Ivanov welcomed the outbreak of the First World War as the start of a new constructive era, as did most other Religious-Philosophical Society members. Merezhkovskii was a notable exception. During the war, Ern gave a lecture 'From Kant to Krupp' in which he argued that Kant's philosophy leads inevitably to a drive for world hegemony. In another lecture, Ern proclaimed that 'the time is slavophilizing'. In his major philosophical work *Struggle for the Logos* (1911), Ern distinguished between the Logos, a real entity, and abstract rationalism, associating the latter with the West.

5 The idealists

The symposium *Problemy idealizma* was a foundational work of the Religious-Philosophical Renaissance. All the contributors emphasized the importance of the individual person, grounded this tenet in a metaphysical worldview, and attacked positivism, materialism and determinism. They came from different milieus. Novgorodtsev, who was also the editor, and the Trubetskoi brothers were devout Christians and long-standing members of the Moscow Psychological Society (founded 1885). Berdiaev, Bulgakov, Frank, Struve and S.A. Askoldov had been 'legal Marxists' in the 1890s. All the idealists were indebted to Kant, and most of them to Solov'ëv as well. Berdiaev and Frank were also captivated by Nietzsche. Novgorodtsev, a liberal and a founding member of the Kadet (Constitutional Democratic) Party, did not write about religion *per se*. Rather, he argued for moral renewal based on 'the principle of the unconditional significance of the person'. Novgorodtsev based his respect for the individual person on Christian and Kantian ethics, which he viewed as compatible, even though he recognized a certain tension between Christian personalism and Kantian rationalism (see Kantian ethics). He regarded the rule of law as a safeguard against arbitrary political power and as a precondition for the development of individuality, and argued that for law to be respected it must accord with morality and justice. Novgorodtsev never gave a paper or participated in the Religious-Philosophical discussions, but he knew about them. During the Revolution of 1905 he argued that political and social reform could not, by themselves, bring about a good society; the prerequisites were moral regeneration and self-perfection. Convinced that there would always be tension between the personal and the political, he wanted to keep them separate. Novgorodtsev did not contribute to *Signposts*, but he sympathized with its critique of revolutionism and gave it his qualified support. In *On the Social Ideal*, serialized 1911-16, he warned that utopianism could lead to despotism. Only in exile did Novgorodtsev write about subjects such as 'The Essence of the Russian Orthodox Consciousness' (1923).

Sergei Trubetskoi held that philosophy must be based on a metaphysics that is deeply rooted in Christianity. He claimed that rationalism, empiricism and mysticism each omit essential aspects of reality, and hoped to unite their insights in 'absolute all-unity'. He called his philosophy 'concrete idealism'. One of its tenets was the communal (*sobornyi*) nature of human consciousness. His most important books are two studies of the history of philosophy, *Metaphysics in Ancient Greece* and *The Doctrine of the Logos*, and three works in which his own views are stated: *On the Nature of Human Consciousness*, *The Foundations of Idealism* and *The Belief in Immortality*. One of Trubetskoi's concerns was to overcome Solov'ëv's pantheism. Another was to resist the 'mystical alogism' of Berdiaev, Bulgakov, and Florenskii by arguing that 'Revelation itself is inseparable from the Logos and is subject to its valuation'.

Evgenii Trubetskoi is best known for his two volume study of Solov'ëv's worldview (Mirosozertsanie Solov'ëva) (1912) which describes the collapse of Solov'ëv's utopianism, but he also wrote about early Christianity, epistemology, and Russian icons. In his newspaper, *Moskovskii ezhenedel'nik (Moscow Weekly)* he argued that Christianity did not mandate either socialism or anarchism, but was compatible with several political systems. He was a co-director of the publishing house Put', which specialized in books and articles about Orthodox philosophy and its contemporary applications.

Signposts was the high-water mark of the former legal Marxists' liberalism and Kantianism. Soon after, their thought took a different direction. Berdiaev and Bulgakov rejected Kant. Frank continued to grapple with 'Kantian' ideas, but was no longer a Neo-Kantian. Struve advocated a mystique of the state, nationalism and imperial expansion.

6 Responses to the Bolshevik Revolution

Merezhkovskii considered Bolshevism the reign of the Anti-Christ and worked against it in Russia and in emigration. Rozanov bewailed 'the apocalypse of our time' and attributed it to the Church's neglect of everyday life. By contrast, Belyi and Blok perceived the Bolshevik Revolution as part of a spiritual revolution that would culminate in a non-materialistic, artistically creative new man. Ivanov regarded it as a religious trial, a Golgotha which would eventually result in Resurrection. In 'Our Language', his contribution to *Iz glubiny*, Ivanov attacked the Bolshevik orthographic reform as a secularizing measure. In their contributions, Berdiaev, Bulgakov, Novgorodtsev, Frank and Struve blamed the Revolution on the secular intelligentsia. Struve emigrated soon after. Berdiaev, Bulgakov, Frank and Novgorodtsev were expelled in 1922. Ivanov left voluntarily in 1924.

Soviet intellectuals discovered the God-seekers in the 1960s. By 1980 there was so much interest that the government began publishing books that debunked them. In 1988-9, however, Gorbachev permitted official publications of their works. Interest grew rapidly and continues to the present day.

Ryle, Gilbert (1900-76)

Alongside Wittgenstein and Austin, Ryle was one of the dominant figures in that middle period of twentieth-century English language philosophy which became known as 'Linguistic Analysis'. His views in philosophy of mind led to his being described as a 'logical behaviourist' and his major work in that area, The Concept of Mind (1949), both by reason of its style and content, has become one of the modern classics of philosophy. In it Ryle attacked what he calls 'Cartesian dualism' or the myth of 'the Ghost in the Machine', arguing that philosophical troubles over the nature of mind and its relation with the body arose from a 'category mistake' which led erroneously to treating statements about mental phenomena in the same way as those about physical phenomena. For Ryle, to do something was not to perform two separate actions - one mental, one physical - but to behave in a certain way.

Much of Ryle's work had a similar theme: philosophical confusion arose through the assimilation or misapplication of categorically different terms, and could only be cleared up by a careful analysis of the logic and use of language. He later became preoccupied with the nature of reflective thinking, since this stood as an example of an activity which seemed to evade the behaviouristic analysis that he recommended. Ryle was also a considerable Plato scholar, though his work in this area has been less influential.

1 Early influences

Gilbert Ryle was born in 1900 in Brighton, England, and went to the Queen's College, Oxford, as a Scholar in Classics. He read Literae Humaniores (Classics and Philosophy) and then Modern Greats (Philosophy, Politics and Economics). In 1924 he became a Lecturer in Philosophy at Christ Church, Oxford, and was to remain at Oxford University for the whole of his academic life.

In a deliberate attempt to avoid sinking into what he felt was a rather parochial philosophical atmosphere at Oxford, in the first few decades of the twentieth century Ryle deliberately directed his academic gaze outwards. He travelled to Cambridge to hear Moore, Russell and Wittgenstein, and set himself the task of reading Wittgenstein's *Tractatus Logico-Philosophicus* as well as dipping into Russell's *Principia Mathematica*. Ryle also set out to gain some knowledge of contemporary continental European philosophy. He taught himself German and read Husserl's *Logische Untersuchungen*, as well as some Croce, Gentile, Meinong, Brentano, Bolzano and Frege. Against the prevailing fashion he offered at Oxford 'an unwanted course of lectures, entitled "Logical Objectivism: Bolzano, Brentano, Husserl and Meinong"', which became known as 'Ryle's three Austrian railway stations and one Chinese game of chance'. Indeed Ryle's first published pieces of philosophical writing were book reviews of works by the Polish philosopher Ingarden (a follower of Husserl) and Heidegger.

As with the Cambridge school, so with the Continentals, Ryle was principally interested in their philosophical logic, and this is reflected in the titles of his earliest papers, 'Negation' (1929), 'Are There Propositions?' (1930) and following shortly after, 'Imaginary Objects' (1933a), 'About' (1933b) and 'Internal Relations' (1935).

In the introduction to his *Collected Papers*, Ryle remarks that 'to elucidate the thoughts of a philosopher we need to find the answer not only to the question "What were his intellectual worries?" but, before that question and after that question, the answer to the question "What was his overriding worry?"' (1971: ix). Ryle himself declared that his overriding worry concerned the nature and function of philosophy itself. This question has arisen from time to time in philosophy but, through the influence both of the scientistic doctrines of logical positivism and Wittgenstein's *Tractatus*, and also because of the remarkable inroads which natural science seemed to be making into the subject matter of philosophy, the question became particularly insistent in the 1920s.

Ryle gave his answer in the seminal paper, 'Systematically Misleading Expressions' (1932). His uncompromising and restricted view of philosophy, as 'the exercise of systematic restatement', became one of the major influences on the style and content of mid-century English-speaking philosophy. It led to those who felt sympathetic to Ryle's (and to some extent Wittgenstein's) view of philosophy being dubbed 'Ordinary Language Philosophers' and to their movement, if it could be called that, being called 'Linguistic Analysis' (seeOrdinary language philosophy, school of §§2-3).

When Ryle came to the task of working out his programme of 'systematic restatement' in more detail, it turned out to consist mainly of two subsidiary tasks, a positive and a negative one. The negative task was concerned with

exposing and correcting conceptual mistakes perpetrated by philosophers' mishandling of ordinary language in the course of propounding and defending philosophical theories. The positive task consisted in what he later described as 'conceptual cartography' or the job of getting clear about the basic categories that were or should be operative in some area of knowledge.

These views were among the influences that shaped the style of English-speaking philosophy in the twentieth century. He believed that the 'growing passion for ratiocinative rigour' was to be satisfied by ever more careful, step-by-step conceptual analysis. Great emphasis was to be placed on getting clear about the exact meaning of terms and, in consequence, on the exact usage of them. Ryle's views about the nature of philosophy also influenced the subject matter of philosophy, because he felt, with Wittgenstein, that philosophers should eschew theorizing and be content with the logico-linguistic analysis of concepts. In turn, this meant that for several decades philosophy in much of the English-speaking world became heavily weighted towards the analysis of language.

For most of the Second World War Ryle was engaged in intelligence work. In 1945, he was elected to the Waynflete Chair of Metaphysical Philosophy at Oxford, which had lain vacant since R.G. Collingwood's death in 1943. In his Inaugural Lecture, entitled 'Philosophical Arguments', Ryle expanded on his views about the nature of philosophy. 'Philosophical reasoning,' he proclaimed, ' separates the genuine from the erroneously assumed logical powers of abstract ideas by using the *reductio ad absurdum* argument as its flail and winnowing fan,' and philosophers of genius are those who have the insight to see, then flail and winnow, new abstract ideas which then become the core of some new area of enquiry or some new way of making sense of an old area of enquiry.

2 *The Concept of Mind*

In 1947, Ryle became editor of *Mind*, then the most influential philosophy journal in the English-speaking world, and set about turning its gaze outwards as well. A few years before, in 1945, he was beginning to crystallize his ideas about a number of issues in the philosophy of mind. The outcome of this, in 1949, was *The Concept of Mind*. As he himself readily admitted, *The Concept of Mind* was 'a sustained piece of analytical hatchet-work' on Cartesian dualism, whose view of mind he gleefully lampooned as an account of 'the life of a ghostly Robinson Crusoe' and as 'the dogma of the Ghost in the Machine'. Strictly speaking, his target was not so much Descartes himself as Cartesian doctrines which he believed had lain more or less unmolested in the philosophy of mind up to that time.

Ryle believed that Cartesian dualism was one large category mistake - an incorrect assignment of the terms of our common-sense psychological vocabulary to one logico-linguistic category or type when they should be assigned to another. After careful philosophical analysis it would be discovered that our mental terms, such as 'mind', 'thought' or 'belief', are not words which refer to or describe an inner private mental world of faculties with their proprietary activities but are mostly to be analysed as dispositional terms whose attribution depends on the ordinary observation of ordinary human behaviour. For dispositions are nothing but an ability, propensity, liability or capacity to do things of a certain type in certain specifiable circumstances. To be intelligent is to be disposed to accomplish successfully such tasks as doing mathematical problems or intelligence tests; it is not to provoke an inner Cartesian faculty, called 'the intellect', into producing its private and proprietary mental acts (see Dualism §1).

Even attributions about what seem to be the most 'inner' and 'private' of mental activities are still to be cashed out in a behaviouristic way. Thus imagining is paradigmatically an outward performance, such as when a boxer imagines, in an afternoon's shadow-boxing performance, how the fight will go that evening. So imagining in one's head should also be analysed in relation to ordinary 'outer' behaviour. To imagine my childhood nursery is not to engage in inner Cartesian performances, but simply to realize, anticipate or expect what I would be seeing if I were once again in my nursery. It is to be disposed to see something *if*…

To take another example, to introspect is not to observe inwardly, in some non-sensuous manner with our 'mind's eyes', some item in our streams of consciousness. Rather, it is to 'retrospect' in memory some behaviour of our own, covert or public, which we have perceived in the past with our ordinary 'outer' senses, and then to make some overall dispositional claims about what we have been able to recall. Indeed, Ryle notoriously asserted in *The Concept of Mind* that 'the sorts of things that I can find out about myself are the same as the sorts of things that I

can find out about other people, and the methods of finding them out are much the same' (1949: 155)

It was conclusions such as these which led many to describe Ryle as a logical behaviourist. In *The Concept of Mind* at least, he seemed to arrive at much the same conclusions as did the psychological behaviourists, but his reasons were logico-linguistic, not methodological. On the other hand, it is probably true to say that both those who assent that Ryle was a logical behaviourist and those who deny it find support for their arguments in *The Concept of Mind* (see Behaviourism, analytic).

3 *Dilemmas* and 'Le Penseur'

In 1953, Ryle gave the Tarner Lectures at Cambridge; they were published the following year as *Dilemmas*. The paradigmatic type of dilemma which Ryle had in mind, and which he believed would yield to the right sort of philosophical analysis, was that which arose when answers to different questions were mistakenly taken to be answers to one and the same questions and so to be in competition with one another. The solution to such dilemmas was to demonstrate that the purported answers cannot in fact be answers to one and the same question because they are of a different logical type or category. Thus, for example, the neurophysiologist's account of perception, the philosopher's account and the ordinary person's account are not in competition with each other, though they might at first appear to be so. When examined closely, each account has been generated in response to quite different questions. The neurophysiologist's question is 'What are the mechanisms of perception?', the philosopher's 'What is perception?', and the ordinary person's 'What is perceived?'

Ryle dealt with other dilemmas by analysing them as arising through the misinterpretation of some unproblematic and innocuous proposition, such that the misinterpretation then emerges as a rival to the common-sense view of the matter. For example, a dilemma occurs when the dictum, 'That whatever is, was to be' is misinterpreted by the Fatalist as 'That for whatever takes place, it was antecedently true that it was going to take place', instead of being given the quite innocuous interpretation, 'That for everything that happens, if anyone had at any previous time made the guess that it would happen, the guess would have turned out correct'. The misinterpretation occurs, Ryle suggested, when the term 'true' is incorrectly assigned to the category of 'property' when it should be assigned to the category of 'verdict'.

Though less spectacular and on the whole less successful than in *The Concept of Mind*, the Tarner Lectures were a further display of his view that many philosophical problems can be solved by 'systematic restatement' through 'the replacement of category-habits by category-disciplines'. This in turn meant that category mistakes are to be corrected by having misapplied terms and the misunderstood concepts underlying them reassigned to their correct categories or types. It was not an idle comment of Ryle's when he said that Russell's Theory of Types had been an important influence on his work (see Categories §2).

Between 1949 and 1954 Ryle wrote a further series of influential papers on philosophical logic, including '"If", "So" and "Because"' (1950a), 'Heterologicality' (1950b), 'Thinking and Language' (1951), and 'Ordinary Language' (1953). At about the same time Ryle also embarked on the first in the series of papers on the theme which was to occupy him on and off for the rest of his life: the nature of thinking, in particular reflective or contemplative thinking. Indeed, he believed that an inadequate account of this latter aspect was one of the major omissions in *The Concept of Mind*.

Ryle acknowledged that mental activities such as doing mental arithmetic or composing a tune in one's head or, in general, doing whatever it was that 'Le Penseur' (Rodin's 'Thinker') was doing posed a particular problem for his approach to the analysis of mind. Such activities were circumstance-disengaged and behaviour-free, and thus there was nothing of which a dispositional analysis could take hold. Eventually Ryle toyed with the idea of giving 'an adverbial account'. Such an account worked well enough in the context of practical thinking. Thinking, Ryle argued, was often doing something, such as playing chess or driving a car, 'thinkingly' or 'wittingly', that is, 'with initiative, care, patience, pertinacity and interest'. However, to give an adverbial account of what 'Le Penseur' is doing, one must first nominate some inner activity of which thinking is the modification. This, Ryle admitted, he was never able satisfactorily to do, and he was still wrestling with the problem at the time of his death in 1976. The record of his struggles with this problem - in the case of true contemplative thinking, of 'finding the peg' on which to hang the adverbial modifications - was published posthumously as *On Thinking* (1979) (see Mental states, adverbial theory of).

4 The return to Greek philosophy

Besides his collected papers, the other major work published by Ryle after *Dilemmas* was a series of articles on Plato which culminated in his book *Plato's Progress* (1966). This was a reappraisal of the chronology of Plato's dialogues, and included the provocative claim that the dialogues had been written for dramatic performance. In the following year his magisterial entry on Plato appeared in Paul Edwards' *Encyclopedia of Philosophy* (1967). These essays in Greek philosophy were not the sign of a change of direction in the last part of his life, but a reversion to one of his earliest philosophical interests. His interest in Greek philosophy, which encompassed both Plato and Aristotle, had never waned. In the 1930s he had immersed himself in Plato's later dialogues; this concentration culminated in his paper on the Parmenides (1939) and in a review of Cornford's book on the same dialogue. These works initiated a revolution in the philosophical interpretation of Plato's later work. In the 1950s Ryle was still enthralling undergraduates with a detailed series of lectures on the Theaetetus; he was a powerful lecturer - tall, firm-voiced, dryly humorous and incisive. When Ryle died in 1976, among his 'work in progress' there was a paper on Plato's *Meno*.

WILLIAM LYONS

List of works

Ryle, G. (1971) *Collected Papers*, London: Hutchinson, 2 vols.(These two volumes comprise all the papers, except for a few very minor pieces, such as reviews and obituary notices, which Ryle published before 1971. Of the papers mentioned in the body of this entry (with their original dates of publication in brackets, but given here with the pagination of their most accessible form, in the *Collected Papers*) - namely 'Negation' (1929: 1-11), 'Are There Propositions?' (1930: 12-38), 'Systematically Misleading Expressions' (1932: 39-62), 'Imaginary Objects' (1933a: 63-81), 'About' (1933b: 82-4), 'Internal Relations' (1935: 85-100), 'Plato's *Parmenides*' (1939: 1-44), 'Review of F.M. Cornford: *Plato and Parmenides*' (1939: 45-53), 'Philosophical Arguments' (1945: 194-211), '"If", "So" and "Because"' (1950a: 234-49), 'Heterologicality' (1950b: 250-7), 'Thinking and Language' (1951: 258-71), and 'Ordinary Language' (1953: 301-18) - all appear in volume 2, with the exception of the two papers on the *Parmenides*, which are reprinted in volume 1.)

Ryle, G. (1949) *The Concept of Mind*, London: Hutchinson.(In this, his *magnum opus*, Ryle sets out to dispel 'The Cartesian Myth' on account of which both philosophy and psychology since Descartes have been haunted by the distinction between the inner and outer world. Ryle makes explicit the traces of Cartesianism in traditional theories of will, feeling, imagination, perception and thought, and tries to obliterate those traces. In place of the myth, he proposes an alternative behaviouristic account of our mental vocabulary.)

Ryle, G. (1954) *Dilemmas: The Tarner Lectures 1953*, Cambridge: Cambridge University Press.(Ryle sets out to resolve certain false dilemmas wherein the ordinary person's account of the world or of their knowledge of it, in terms of, for example, the concepts of pleasure or motion or perception, is made to look as if it is opposed to and so inferior to some technical or scientific view of the world. These resolutions are a practical demonstration of Ryle's view that many philosophical problems are just cases of conceptual confusion which can be dissolved by 'systematic restatement' through 'the replacement of category habits by category disciplines'.)

Ryle, G. (1966) *Plato's Progress*, Cambridge: Cambridge University Press.(A provocative intellectual history of Plato, in which Ryle questions the accepted chronology of Plato's dialogues and suggests that by and large they were composed for public recitation at the great Hellenic festivals. He also disputes whether Aristotle was in any meaningful sense ever a disciple of Plato.)

Ryle, G. (1979) *On Thinking*, ed. K. Kolenda, Oxford: Blackwell.(This collection of eight papers on topics of thinking encompasses most of Ryle's papers which were published after his *Collected Papers* went to press. It also includes an interesting preface by Geoffrey Warnock as well as a very brief appendix, entitled 'On Bouwsma's Wittgenstein'.)

Ryle, G. (1993) *Aspects of Mind - Gilbert Ryle*, ed. R. Meyer, Oxford: Blackwell. (Includes some of Ryle's previously unpublished 'publishable' papers, most of which were written between the late 1950s and the late 1960s. Among them is a paper on Plato's *Meno*, a short piece tracing the development of Oxford Philosophy in the mid-century, a set of notes of Ryle's lectures and a seminar taken by Meyer, and two tributes to Ryle. In his 'Annotations', Meyer mentions that 'when he retired as Waynflete Professor of Magdalen College in 1967, Ryle donated his books and some papers to Linacre [College, Oxford]. The collection consists of about 1,100 books, some papers, rough notes and letters'.)

Régis, Pierre-Sylvain (1632-1707)

Régis helped to define and disseminate Cartesianism. He proselytized on its behalf, defended it against its critics and innovators, and wrote the systematic textbook for which Descartes had hoped. Although primarily an expositor of Descartes' views, he sometimes developed them in creative ways that tended towards empiricism. He seems to have been led in this direction by Robert Desgabets who, while adhering to Descartes' principles, consciously departed from what Descartes actually said in order to be 'more Cartesian than Descartes himself'. The same may often be said of Régis.

'One of the ornaments and pillars of the Cartesian sect', as Pierre Bayle called him, Régis was born near Agen, France. After his education by the Jesuits at Cahors, he studied theology in Paris, where he became interested in the philosophy of Descartes. A clearly important influence was the weekly lectures given by the leading proponent of Cartesianism, Jacques Rohault. A more important influence came from Robert Desgabets, who may have introduced Régis to Descartes' philosophy. Desgabets would have provided him with an understanding of those of its principles, particularly the doctrine of created eternal truths, that gave it a quasi-empiricist complexion.

Around 1665, Rohault sent Régis to Toulouse to spread the gospel of Cartesianism. There, at Montpellier (where he met Locke), at Aigues-Mortes and finally back in Paris in 1680 after the death of Rohault, Régis' lectures enjoyed enormous success. However, given the official opposition to Cartesianism because of the theological controversies it generated, the lectures were suppressed by the Archbishop of Paris, and the publication of Régis' first, longest and most important work, the *Système de philosophie* (1690), was delayed for ten years.

Régis was less a creative thinker than an expositor of what he took to be Cartesianism (even if he sometimes developed it in surprising ways), which he defended in a number of polemical works. His *Système* criticized Malebranche on several topics, on three of which Malebranche and he then exchanged 'Replies': the nature of sensual pleasure, the problem of the horizontal versus meridional moon (on which Régis was demonstrably mistaken), and, most importantly, the nature of ideas (see Malebranche, N. §§1, 2).

As had been the case in Malebranche's much longer debate with Arnauld over the nature of ideas, the central issue was whether the soul's modifications are essentially representative (as Arnauld and Régis held), or whether ideas different from those modifications are required for knowledge of material things (as Malebranche held). Many of the same arguments from the Arnauld debate reappear - for example, Malebranche's contention that a modification of the soul, which is a particular, cannot represent a circle in general (see Arnauld, A. §3). But novel points also emerge, one of the most important being Régis' contention that the exemplary cause of an idea is the thing it represents, which he deduces from the principle that a representation cannot be of nothing. Régis and Malebranche, in fact, share this principle but draw different conclusions from it: Malebranche sees perception mediated by God, while Régis has it directly of objects. Malebranche's problem is to explain how we know material things; Régis' problem is to explain how we can fail to do so.

Malebranche's cause in general was taken up by his disciple Henri Lelevel, who found Régis committed both to Spinozism and to scepticism (see Spinoza, B. de). Régis tried to respond to the charge of Spinozism by condemning in no uncertain terms the view that there is only one substance, which is God, but he seems not to have rejected or modified his earlier view that individual minds are modes of thought, just as individual material things are modes of extension. Thus, while holding with Desgabets that substances are indefectible, the basis for personal immortality seems none the less upset.

In other debates, Régis defended Cartesianism against the sceptical attacks of P.-D. Huet, against the objections of Jean Du Hamel on a range of issues beginning with the theory of ideas, and finally against the misgivings of Leibniz, with whom he also exchanged 'Replies' concerning the consequences of Cartesianism for religion and piety. In his last work, *L'usage de la raison et de la foi* (1704), Régis sought to establish the compatibility of faith and reason, essentially by establishing their independence. He was one of the few Cartesians to subscribe to Descartes' doctrine of the created eternal truths, which he thought followed from God's omnipotence (see Descartes, R. §6). He held, moreover, that anything dependent on God's will can be known only through experience or revelation, and thus the apriorism usually associated with Cartesianism is contrary to the central

thrust of Régis' philosophy. This thrust is clear, too, in his conception of the soul, which thinks through the body.

Régis disavowed the occasionalism that he might have been expected to hold (see Occasionalism). His emphasis on divine omnipotence led him to the principle on which Malebranche had based his occasionalism: 'there is such a necessary connection between His will and the existence of the thing He wills to produce that it is incomprehensible that God should will a thing to be produced and that it not be' (1690: 110). But the created things between which this necessary connection fails to occur are none the less real secondary causes, and not just occasional causes of God's operation. As occasional causes determining God to act, they would violate his immutability. It is open to question, however, whether Régis really understood the doctrine of occasionalism, and whether the occasional causes of Malebranche really differ from Régis' secondary causes, which he describes as having 'no proper causality' and as 'contributing to the production of things only by serving as instruments by which God modifies His action' (1690: 125).

In accordance with the arboreal metaphor in the introduction to his *Principles*, Descartes thought that all philosophy was connected and based on metaphysics. Aside from the earlier sketchy effort of François Bayle, however, Régis' *Système* was the first attempt to produce a systematic and comprehensive account of the Cartesian view of things that Descartes had only imperfectly realized. In addition to logic and metaphysics, an extended physics, biology and so on, the *Système* also offers ethical, political, legal and theological theories. The title of its second edition (1691) seems fully justified: *Cours entier de philosophie ou système général selon les principes de Mr. Descartes*.

THOMAS M. LENNON

List of works

Régis, P.-S. (1690) *Système de philosophie contenant la logique, la métaphysique, la physique et la morale (System of philosophy containing logic, metaphysics, physics and morality)*, Paris; 2nd edn, Amsterdam, 1691; repr. with introduction by R.A. Watson, New York and London: Johnson, 1970.(A textbook account of the Cartesian system, but one that departs from the views of Descartes in a number of crucial respects, for example in holding that individual minds are modes of a single substance.)

Régis, P.-S. (1691) *Réponse au livre qui a pour titre P. Danielis Huetii censura philosophiae cartesianae (Response to book which has as its title P. Daniel Huet's critique of philosophy)*, Paris.(A defence of Cartesianism against the sceptical attack of Pierre-Daniel Huet.)

Régis, P.-S. (1692) *Réponse au réflexions critiques de Du Hamel (Response to the critical reflections of Du Hamel)*, Paris.(Important for Regis' views on, among other things, the creation of the eternal truths.)

Régis, P.-S. (1694) *Première réplique á…Malebranche [Seconde… Troisième…] (First reply to Malebranche [second… third…])*, Paris.(Polemical works directed against Malebranche on three topics: the nature of ideas, the problem of the horizontal versus meridional sun, and the nature of sensual pleasure.)

Régis, P.-S. (1697) 'Réflexions sur… Leibniz… ' (Reflections on Leibniz), and 'Réflexions pour… réplique…' (Reflections for… response…), *Journal des savants* 17 June and 16 November.(A defence of Cartesianism against Leibniz's criticisms with respect to religion and piety. Compare Leibniz's *Die philosophischen Schriften*, ed. C.I. Gerhardt, Berlin: Weidmannsche Buchhandlung, vol. 4, pages 333-42.)

Régis, P.-S. (1704) *L'usage de la raison et de la foy ou l'accord de la foy et de la raison (The use of reason and faith or the relation of faith and reason)*, Paris.(Important for the author's views on causation, immortality, the mind-body connection, as well as the relation between faith and reason; a refutation of Spinoza is appended.)

Sa skya Paṇḍita (1182-1251)

The philosophical importance of Sa skya Paṇḍita (Sagya Paṇḍita) lies in his clarification of the tradition of logic and epistemology established by Dharmakīrti. He actively promoted the study of Dharmakīrti's thought in Tibet as a propaedeutic to the study of other systems of Buddhist philosophy as well as to a Buddhist account of knowledge; knowledge is a crucial element in the Buddhist tradition, for ignorance is considered the main obstacle to liberation, the summum bonum *of the tradition. Like Dharmakīrti, Sa skya Paṇḍita held that the only two types of knowledge are perception and inference. Perception presents us with real individual objects, while inference enables us to consider these individuals in a conceptual way, in terms of universals; however, it is a mistake to regard these universals as real.*

Sa skya Paṇḍita (Sagya Paṇḍita), whose name is often shortened to Sa-paṇ, is a dominant Tibetan figure whose accomplishments go well beyond the domain of philosophy. Politically, he was the first ruler of a unified Tibet after the collapse of the Tibetan empire in 842. He was chosen by the Mongolian Prince Godan to govern Tibet under Mongolian supervision, and was summoned to the Mongolian court, where he spent his last years. Religiously, Sa skya Paṇḍita was the fourth leader of the school named after the monastery of Sa-skya in southwestern Tibet. He played an important role in bringing the monastic and Tantric aspects of Tibetan Buddhism together, furthering Atīśa's attempt to harmonize these two traditions by describing the practice of Tantra from a monastic perspective in his *ldom gsum rab byed (Differentiation of the Three Vows)*.

Sa skya Paṇḍita is important philosophically for his contribution to the tradition established by Dharmakīrti, which was introduced into Tibet by rNgog lōtsa ba Blo ldan shes rab (Ngok lodzawa loden shayrap, 1059-1109) and Phya pa Chos kyi seng ge (Chaba Chögyi sengge, 1109-69). Through these two thinkers, an important indigenous tradition of logico-epistemological study developed, based on realist principles. Its orientation was actually quite different from Dharmakīrti's antirealist philosophy, as Sa skya Paṇḍita discovered while studying with the recently exiled Indian pandit, Śākya Śrībhadra (1127-1225). To expose and correct the revisionism of rNgog, Phya pa and their followers (among which the later dGe-lugs tradition is included), Sa skya Paṇḍita wrote his famous *Tshad ma rigs gter (Treasure on the Science of Valid Cognition)*.

Sa skya Paṇḍita interprets Dharmakīrti as espousing a conceptualist view of universals, in opposition to Phya pa's realist interpretation, which allows for the existence of real universals. In the Buddhist tradition, reality is composed of momentary and causally effective objects set apart from the realm of unreal conceptual entities. For Sa skya Paṇḍita, only individuals can be real, since an entity can be considered real if, and only if, it has its own distinctive essence (*rang bzhin*; *svabhāva*). The term 'specifically characterized phenomenon' (*rang mtshan*; *svalakṣaṇa*) used by Dharmakīrti indicates quite well the individual nature of real entities. For Sa skya Paṇḍita, the distinctive essence corresponds to clear identity conditions, spelled out in terms of definite spatiotemporal location. Only things clearly located in space and time are real. Tested this way, individuals pass, while universals do not.

Abstract entities such as properties or universals are described by Dharmakīrti as 'generally characterized phenomena' (*sāmānyalakṣaṇa*; *spyi mtshan*). They are conceptually superimposed onto reality and hence are without the power to produce an effect. This does not mean, however, that they are completely nonexistent. Although less than real, universals have a minimal ontological status as objects of concepts. They are quasi-entities, whose existence does not rest on any extra-mental reality and is presupposed by thought.

Sa skya Paṇḍita's epistemology reflects his parsimonious ontology. Following Dharmakīrti, he asserts the existence of only two types of knowledge, perception (*pratyakṣa*; *mngon sum*) and inference (*anumāna*; *rjes dpag*). These two types of cognition are distinguished on the basis of their objects and their modes of operation: whereas perception is nonconceptual and relates to real objects through experience, inference apprehends unreal conceptual constructs on the basis of reasoning.

It would be a mistake, however, to think that Sa skya Paṇḍita's view of perception is that of a straightforward empiricist who would hold perception to be cognitive by itself. For Sa skya Paṇḍita, we do not know things only by sensing them, for we need concepts to identify them. Since perception is nonconceptual, it cannot deliver fully

articulated objects, but only initiates a contact that becomes cognitively relevant through categorization. Perception passively holds an object and induces the appropriate conceptual judgement, thereby creating a fully cognitive situation. Whether or not the perceiver adequately ascertains the situation depends less on the perception than on the perceiver’s conceptual state.

The other form of knowledge is inference, which is conceptual. This is the more active form of knowledge, which categorizes the objects perceived and synthesizes them on the basis of a reason. In this way it brings signification to the bare data apprehended by perception, and extends knowledge beyond the purview of the evident. Unlike perception, conception does not mirror the reality of individuals, but relates to universals, which it mistakenly projects onto the former. In this way, conceptuality constructs the universe of meaning in which humans live. Sa skya Paṇḍita’s conceptualist and constructivist bent also concerns language, which like thought is based on conceptual activity.

The process of conceptual construction, which characterizes thinking and language, is negative in nature: conceptual constructs are formed by eliminating their contradictories. For example, the concept of tree is constructed by eliminating the non-tree. This process requires thought to create a dichotomy between a conceptually constructed property (being a tree) and its contradictory (not being a tree). By eliminating this contradictory, a property is constructed. Such a quasi-entity is just an elimination of others (*anyāpoha*; *gzhan sel*); it does not exist in reality and is merely superimposed by thought. In this way, the strict distinction between the real and the conceptual is maintained.

Saadiah Gaon (*fl.* early 10th century)

Saadiah Gaon al-Fayyumi was the first systematic philosopher of Judaism and a pioneering exegete, grammarian, lexicographer, liturgist and chronologist. His Kitab al-mukhtar fi ’l-amanat wa-’l-’i‘tiqadat (Book of Critically Chosen Beliefs and Convictions) uses reason, experience and tradition to elaborate a monotheistic theology and pluralistic ethics.

Organized in ten thematic treatises, the work, familiarly known by the title of its Hebrew translation, Sefer Emunot ve-De‘ot (The Book of Beliefs and Convictions), opens with a striking epistemological prelude laying out the sources of knowledge in sense experience, reason and (for the recipients of Scripture) tradition. Saadiah defends sense experience on the grounds that scepticism is self-undermining. He defends reason as the basis of critical and scientific knowledge; and he defends the Jewish sources of traditional learning on the grounds of the continuity and trustworthiness of their transmission. He treats tradition not as an independent source of knowledge but as a means of preserving primary knowledge acquired in the past.

The ten treatises of the work defend creation against alternative cosmological theories, argue for God’s unity and incorporeality, explain the human situation as a trial designed to test and reward human goodness, defend God’s justice and the substantiality and immortality of the soul, affirm the national restoration promised by the prophets of Israel, and lay out the constituents of the good life, which Saadiah argues is undermined by excessive attention to any one of the varied goods available to us. Committed to reason, science, free will and God’s ultimate justice, Saadiah champions the veracity of Scripture using his formidable philological skills and learning to find appropriable interpretations of biblical language whenever the apparent textual sense to be ruled out by reason, science, another text, or a sound tradition. In keeping with the Rabbinical and Biblical outlook, he upholds the value of this life on the grounds that only here are authentic choices possible. Saadiah’s philosophy profoundly influenced Maimonides and later Jewish thinkers; his biblical commentaries are still consulted for their philosophical and philological insights.

1 Life and works

Born in Egypt well and educated in Scripture and Rabbinic law, Saadiah published his first Hebrew-Arabic lexicon in 913, expanding it gradually to over one thousand entries. He sought a philosophical correspondence with the Jewish Neoplatonist Isaac Israeli. His polemics against the Karaites evidently led to his removal from Egypt. Living in Palestine, Iraq and Syria, he deepened his knowledge of history, philosophy and Scripture, studied with Abu Kathir Yahya al-Katib of Tiberias, and absorbed the ideas of the Jewish philosopher/*mutakallim* (dialectical theologian) Daud al-Muqammas and the Masoretes of Tiberias. His writings show a thoughtful acquaintance with the Arabic texts of Plato and Aristotle.

Gaining repute for his successful defense of the traditional Hebrew calendar against proposed alterations, Saadiah was appointed an *alluf* (master) of the ancient Talmudic academy of Pumpedita, now, like its sister academy of Sura, relocated in Baghdad. In 928 the Exilarch David ben Zakkai made Saadiah head of the Sura academy, with the traditional title Gaon (eminence). Ben Zakkai was not put off but only piqued when warned that Saadiah seemed to fear no one. By 930 the two men were at loggerheads over Saadiah’s refusal to sign a testamentary judgment in which ben Zakkai had improperly awarded himself a fee from the proceeds. Bans, depositions, factions and even riots ensued.

Refusing a bribe from a jealous rival, the Khalif assigned the case to ‘Ali ibn ‘Isa, ‘the good wazir’, as ‘Ali was known, restored Saadiah to office and was seeking to reconcile the rival leaders when the Khalif was killed in a coup d’etat and ‘Ali’s government was prorogued. When the new and impecunious Khalif al-Qahir ascended the throne, Saadiah was deposed. At length a reconciliation was achieved, consummated in a moving ceremony in 937. The anathemas were withdrawn and Saadiah restored to office with approval of the new Khalif al-Radi and the reinstated ‘Ali ibn ‘Isa.

Deprived of judicial authority for seven years, Saadiah pursued scholarship and philosophy. His commentary in 931 on the Kabbalistic *Sefer Yetzirah (Book of Creation)* adopts a scientific cosmology. Like the Muslim savants of his day, he knows that the earth is round; he has no use for a flat-earth cosmology and refuses to prop it up

against Scripture. Philosophy and history, he urges, are the proper work of man, in which God will aid us, ‘disclosing deep things’ (Job 12: 22). By 933 Saadiah completed his chief philosophic work, opening with a critical epistemology, a constructive, rationalistic empiricism, buttressed by a subdued Platonism and enriched by a chastened traditionalism that relies on trustworthy ancestors for their histories and hermeneutics but does not treat tradition as a source of knowledge independent of reason and experience.

Saadiah finds little use for the Neoplatonic ‘active intellect’ (see Neoplatonism). Yet, his naturalism and rationalism do not exclude mysticism. Prophets and the blessed derive comfort and inspiration from a ‘created light’ that is no rival to God’s absoluteness but allows the immanence of divine action. Anchoring what would later become a central Kabbalistic tenet, reciprocity between the human and the divine, Saadiah systematically glosses ascriptions to God of emotions like yearning, satisfaction and joy, as transferred epithets whose logical subject is a human being. The approach finds consummate expression in the liturgical phrase applied to Jacob, and thus to all Israel: ‘whom Thou didst love with Thine own love and rejoice with Thine own joy’. Spinoza later uses the same idea in explaining how the Infinite can care for finite individuals.

Saadiah’s books on language, surviving only in fragmentary form, include the earliest known Hebrew grammar. He composed the first scholarly *Siddur* or Hebrew prayerbook. Most of his liturgical poetry is lost, but his didactic poem on the Ten Commandments and his penitential and petitionary prayers, found in the Cairo Geniza, convey the flavour: highly allusive writing of the philological type favoured in his day. His prose prayers are more straightforward, and his Arabic prayers and translations of Hebrew prayers reveal his expressive powers.

Saadiah’s Arabic Bible translations and commentaries assign each book a thematic title and include an introduction explaining the book’s problematic and complementing the linear commentary to reveal the higher order argument. The commentaries are openly philosophical and typically fight shy of midrashic embroideries.

Most of Saadiah’s *halakhic* contributions are lost, but in the fragmentary corpus that survives, thematic introductions and conceptual organization reveal the role of philosophy in structuring Saadiah’s thought. Saadiah’s lost *Kitab al-ta’rikh (Chronology)*, apparently was intended as a summary of history from the creation. As Franz Rosenthal (1968: 139) showed, the work represented the movement towards linear historiography that was ongoing in Saadiah’s time. Saadiah’s goal was to situate Biblical and other events chronologically. His exegetical writings show a similar interest in geographical orientation.

2 *The Book of Critically Chosen Beliefs and Convictions*

Saadiah’s philosophical *chef d’oeuvre* is commonly known by the Hebrew title, *Sefer Emunot ve-De‘ot (The Book of Beliefs and Opinions)*. But in what seems to be his final revision it bears the title *Kitab al-mukhtar fi ’l-amanat wa-’l-’i‘tiqadat (The Book of Critically Chosen Beliefs and Convictions)*, ‘And rightly so’, Joseph Kafih explains. ‘For our teacher did not set out simply to gather a compendium of beliefs and convictions, but to demonstrate which beliefs were worthy of choice and which convictions were true in his estimation’ (Kafih 1970: 1). Like Aristotle and Plato, Saadiah surveys and criticizes rival views, choosing one to be accepted. As in *kalam* (dialectical theology), he answers objections and arrays arguments, scriptural and rational, against the rejected views and in support of the view he deems orthodox; but the enterprise is never purely apologetic, since what passes muster cannot remain unaffected by the demands of critical scrutiny.

The work comprises ten ‘treatises’. The introduction lays out Saadiah’s epistemology. Doubt is a natural concomitant of our finitude but can be overcome by subduing its causes, ignorance and impatience. Subjectivism is absurd, since opinions do not determine reality; nor does disbelief exempt us from our obligations. Saadiah defends perceptual knowledge, arguing that systematic scepticism about perception itself is self-destructive. He goes on to urge that the methods needed to render perceptions trustworthy lead inevitably to general theories and thus to the sciences. Only the superstitious forbid speculation, fearing for the faith. Such fears are as irrational as the fantasy of the ignorant that whoever travels to India will grow rich.

Treatise 1 defends creation as the bulwark of theism, warning against attempts to explain the ultimate Cause found by reason. ‘Explaining’ the ultimate in terms, for example, of sensory phenomena would reduce God to the very facts that creation was invoked to explain. The revolution of the heavens proves the cosmos finite; its finitude and compositeness, the temporality of all accidents in nature, the inability of finite particulars to cause their own existence, all prove the world to have been created. True, nothing comes from nothing, but for that very reason,

creation provides the best explanation for nature’s existence.

Neoplatonic attempts to derive the physical from the ideal explain the obscure by the more obscure and bring matter and spirit no closer together than does the sheer Biblical creation. Materialism, by contrast, hides a tendency to confuse cause with effect. Our aim is not to deny causality; but proximate causes are just part of the cosmic system. They are insufficient without the ultimate cause. Thus, when Aristotelians ascribe the cosmic order to the celestial motions, Saadiah emphasizes that circular motion is natural to the heavenly bodies, and is thus part of what we are seeking to explain.

Against the idea that chance is the ultimate cause, Saadiah argues that chance could not produce a stable system. Besides, chance can be defined only relative to a natural order; so it is incoherent to treat it as the ultimate cosmic principle. The idea that nature has always been as we observe it, by contrast, extrapolates our experience to the wholly unknown.

Treatise 2 derives God’s unity from his incorporeality as the absolute creator, from his oppositeness to the world’s multiplicity, and from the economy of explanations: one cause is sufficient, more would be redundant and would require proof beyond the sole proof we have, the act of creation. Dualists and polytheists have no way of limiting divinities once they begin; in the end they cannot help making a god of every element or principle. If God needed help or cooperation to make or rule the world, he would be powerless; and if some other god were not his aide but free to contradict him, the two would either limit one another’s power, making neither divine, or overrule each other - so that the same object, for example, could have contradictory characteristics.

As for attributes, God’s life, power, knowledge and transcendent goodness are known from the act of creation. However, God’s attributes represent a single reality; they differ only in our understanding. Thus they are figures, like the Biblical anthropomorphisms, not to be taken literally. Paradigmatically, the ascription of loves and hates to God expresses normative intentions. God’s speech is a created sound, and God’s ‘back’, as seen by Moses, is his created glory.

God created the world, Treatise 3 explains, to allow humans to earn blessedness. Earned desert is far more precious than mere bliss, but the effort to earn blessedness entails real risks: trials of our mettle, accountability for our choices, sufferings that may be warnings or chastisements, or ‘sufferings of love’, whose purpose, which we cannot know when we undergo them, is enhancement of our reward in the hereafter through recompense for preserving our integrity. The chief vehicle of our test, for which the world was created, is the system of our obligations. The most basic of these are well known to reason, as when we recognize the wrongfulness of causing bloodshed or pain, fornicating, stealing or lying. But many of the commandments are known to us only because they are revealed. Their performance is our obligation not because of any intrinsic value in the acts they involve but because they function symbolically, as expressions of gratitude, a fitting means of honouring our Creator.

The rational commandments are not derivable from hedonism or from any merely empiric naturalism. Hedonism will make the same act, such as a theft, both good and evil, since it brings pain to the victim and pleasure to the thief. But if we recognize the need to differentiate ourselves from animals (and so do not fornicate), understand that misrepresentation is a grotesque perversion of creation (and so do not lie), and see that bloodshed thwarts fulfilment of God’s plan (by violating the potentials God imparted to be realized), we discover the values underlying some of the precepts of the Law. We can even find the rational basis for the ritual commandments, those that would have had no strict standing as obligations had they not been commanded. Reason demands a response to generosity, and all the ritual commandments, although they may yield benefits (Sabbath rest, Levitical purity), are ultimately expressions of gratitude. Such laws, then, have a purpose, but that purpose alone does not define, but as we might put it today, underdetermines their content. Prophets are needed to spell out God’s expectations. Miracles corroborate the claims of prophets, and tradition preserves their message, vouching for its authenticity, but also interpreting it. Just as reason is prior to revelation, tradition is posterior to it; none of the three can stand alone.

Treatise 4 presents man as the object of creation, at the centre of the cosmos, endowed with moral freedom. Our bodies are small, but are the best that could be given mortal beings; and the human soul is vaster than the cosmos, which its knowledge embraces. That cosmos was created in our interest, not for our pleasure. Life is short, but the choices made while choice is possible are of absolute significance. As with any growth, dead wood must be

cleared away. Thus there is capital punishment in this world and hellfire in the next, where the very light that comforts the blessed torments the damned. God gives us the capacity to act and choose, but some choices may diminish our degrees of freedom. What God forms is our underlying nature; our character is our own work.

We are judged, Treatise 5 teaches, by the preponderance of our good or evil actions, whose inner worth God knows irrefragably. Reconciling virtue ethics with command ethics, Saadiah finds each act significant, but insists that one act is not our character. Thus penitence is possible, fulfilling regret, just as action fulfills intent. The weight of our choices, however, precludes redemption of every act: once choices have sealed our character they have sealed our destiny, and even penitence becomes impossible. Prayer goes nowhere when it is insincere or intransigent; it is bootless in one who is actively neglectful of the Torah or the poor, mired in embezzlement or impurity. Three sins will not be expiated: slander, misleading others and retention of ill-gotten gains. Three merits are rewarded in this world, even for those who reject God’s service: filial piety (Exodus 20: 12), kindness to animals (Deuteronomy 22: 7) and honest dealing (Deuteronomy 25: 15). Like Maimonides after him, Saadiah derives not merely the commandment (and its reward) but the generalized theme of each precept: not simply releasing the mother bird, but kindness to animals; not simply fair weights and measures, but honest dealing.

The soul, Treatise 6 argues, is created on completion of the body with which it is united. Neither soul nor body is impure; sin results only from our own wrong choices. Like the heavenly spheres, the soul draws luminosity from God, gaining life and consciousness, which allow it to animate a body that would otherwise be passive and inert. Once its destiny is complete, it returns to God, who allowed it to act through the body’s intermediacy. When the tally of souls God destined for existence is complete, all are reunited with their bodies and judged. Those whose lives were cut short or who suffered undeservedly are recompensed, including the slain infants of Israel’s ancient conquest, and even any animals that suffered unduly in the Temple sacrifices.

The soul is not an accident; it is not a function of the body or adjunct of the blood. Nor is it a self-moving number, an entelechy or an epiphenomenon. The world was not created for the sake of an accident. The soul is not made of fire or air, for it lacks their qualities. It is not of two parts locatable in the head and heart, for the soul would be what enables these to interact. Nor are there three separate souls, as suggested by Plato. Appetite, ire and reason are faculties of one soul, called alive in virtue of the immortality to which it is heir. The demands of theodicy may give colour to the theory of metempsychosis, but understanding that God’s grace and justice assure us of recompense for all unrequited sufferings and retribution for all unpunished wrongs deflates the appeal of the notion of transmigration.

Treatises 7-9 differentiate resurrection, redemption and requital. Resurrection reunites body and soul here in the world. All monotheists will share in it, but Israel will have the leading role because of her long sufferings. God did not include resurrection in the first redemption, the exodus from Egypt, but promised it for the future, because Israel’s present bondage is heavier than the Egyptian enslavement.

Redemption is the historical vindication of God’s promises to Israel: the ingathering of her exiles, the return of prophecy and the restoration of the Davidic monarchy. But the ultimate requital must be otherworldly, to respond to transcendent human goodness and suffering, sin and cruelty. In this world, Saadiah argues, following Al-Razi, pains outweigh pleasures, the wicked often triumph, and suffering innocents are not requited. God’s mercy must remedy life’s defects. Were it not for future requital, fire and brimstone would surely have fallen on the earth long ago, as they did on Sodom and Gomorrah.

But the hereafter is not an earthly place. Only metaphorically is it called Tofet or Eden. Time itself will be transmuted in the new heaven of which Isaiah spoke. The most striking transcendence will be moral: our trials over, there will be no more need, or chance, for choices, but the infinite consequence of our decisions in this world will be played out to eternity.

3 The good life

Treatise 10 concerns the good life, defined in moral terms, for we do not know the reward of the ritual commandments even in this life, still less in the hereafter. Saadiah’s eudaimonism is pluralistic, based on the complexity of human nature. Like Plato, he sees the good life as a balancing of interests (see Good, theories of the §5). He does not break these down into intellectual, appetitive and spirited, but elicits his own list from Scripture and from observation of human nature: abstinence, eating and drinking, sex, passionate love, wealth, progeny,

agrarian and urban development, longevity, power, vengeance, knowledge, worship and rest. Each of these (even vengeance) is in some sense a good, but none, as devotees might imagine, offers a fulfilling life. To make one of them our sole object is to cheat ourselves of the rest.

Self-denial is a valuable discipline, but the pure ascetic is misanthropic and embittered; his isolation feeds his envy and deprives him of the piety he may have sought. Food and drink sustain body and mind and foster reproduction, but the gourmand is bloated, unhealthy, selfish, foggy-headed and licentious. Sex is a unique delight, countering melancholy, cementing human relations and well accepted by the prophets, but the lascivious are unhealthy and typically adulterous. Passionate love has its place, sustaining the marital relationship; but, as a way of life, it is an absurd obsession, often a source of regret or hatred. Progeny perpetuate the world and give solace and joy, but offspring are also a hardship and source of anxiety; they are not sufficient to give meaning to our lives. Development is useful and satisfying; but taken beyond human need and made our overriding object, it distracts us from intellectual and spiritual goals and becomes a source of anxiety and compulsion. Longevity too is a means to an end, allowing us to attain our spiritual and worldly goals, but the valetudinarian must know that even the vigorous often die young, and there are higher goals than maintenance of the body.

Power or authority is necessary to the ordering of the world; but, if made all-sufficient, it promotes arrogance and injustice and becomes self-destructive, transforming a ruler’s ebullience from overconfidence to the tyrant’s suspicions and hatred of humanity. Vengeance is the most specious of *prima facie* goods. It gives momentary satisfaction, but the scheming it engenders fosters anxiety and ruthlessness. Hatred cannot be made a way of life. Vengeance may spur us in pursuit of justice, but vengeance is not justice. Like all other *prima facie* goods, it becomes an actual good only when mitigated by the rest.

Knowledge is a good, but even the quest for knowledge can be excessive; pursued to the exclusion of all else, our appetite for knowledge would ruin our health, even dull our mind. Worship is a fitting expression of gratitude; but, as an exclusive goal, it is self-undermining. How can we fulfill the commandment to keep just weights and measures if we eschew all social engagement and economic activity? Pietists may aspire to devote themselves wholly to God, but their neglect of their bodies and their offspring cannot be condoned. Finally, rest is needed, and is prescribed for sabbaths and holy days. But rest is possible and valuable only through work; laziness is destructive. Rest imparts a taste of the world to come, but our obligations are for this world.

Saadiah underlines his integrative pluralism with a brief discussion of aesthetics. Blending, he argues, is the key to beauty. Tastes, colours, sounds, even smells are beautiful when mingled; rough, even injurious, when left simple. All goods - and Saadiah acknowledges more *prima facie* goods than he has listed - have their proper place and context, and this can be found, if one is not simply rationalizing one’s appetites and desires but inquiring after the truth with humility and sincerity. The Torah lays out a way of life that enables us to balance the goods pertinent to our nature, allowing none to usurp the place of reason.

Sacraments

The Christian theory of 'sacraments' underlies ideas of a general 'sacramentality' in the universe whereby ordinary things have religious significance by their own nature or by virtue of some hidden power within them. The pre-Christian Latin word sacramentum *meant a non-returnable gift marking the taking on of some binding obligation; more informally it meant an oath, and later a secret or mystery. Latin theology turned it to Christian use, initially in rough translation of the Greek* mysterion, *applied to the Church, to the Scriptures and to Old as well as New Testament rites. The word then became the predominant medieval and modern term specifically designating those rites in permanent use in the Church which human authority was conceived not to be free to abolish, add to or change in their essentials.*

Each such rite presupposes that the creaturely things used have some aptitude which allows or invites the particular ritual use concerned, that is, which presupposes some more general sacramental potential in natural things. The conceptual tools developed in Catholic theology - 'effective sign', 'matter and form', 'sacrifice', 'authority', 'power' and 'institution' - sharpen enquiry into the phenomenology of rituals within many different religious traditions.

1 Explaining early conceptions: the 'seven sacraments'

The so-called seven sacraments existed in the Church long before being classified together as 'sacraments' to distinguish them from other Church rituals, and long before any discussion of their precise number or what they had in common - what it is to be a 'sacrament'.

The Fourth Lateran Council (1215) set forth the Western Catholic conception of seven sacraments: two of initiation - Baptism and Confirmation; the Eucharist, the central action supposed constitutive of the Church, around which the others are grouped (commonly referred to as the Mass or the Divine Liturgy, or, among Protestants, Holy Communion or the Lord's Supper); two of healing - Reconciliation (absolution from sin, commonly referred to as Confession or Penance) and the Anointing of the Sick (Extreme Unction); Ordination, conveying authority to celebrate the Eucharist and to teach; and Marriage, which is unique as the context of cooperation with God in his creation of new persons, and gives grace enabling marriage to imitate the mystery of the love between Christ and the Church. The Eastern Orthodox Churches generally agree in the same list. Protestants tend to similar conceptions of which rites are integral to the life of the Church, but regard only baptism and the Eucharist as instituted by Christ himself, and so only these as sacraments in the strict sense (although Luther initially ranked confession as a third). All agree on the higher status of baptism and the Eucharist.

Catholic theological tradition saw a sacrament as essentially an action that is effective in communicating grace, the action being such as to signify what is being done. The philosophical concept of 'effective sign' defined what the seven rites had in common.

How was effectiveness viewed? God alone (acting immediately, not deputing his power) gives grace inwardly in the sacraments, with Christ himself acting as principal agent through the Holy Spirit; the ministers of the sacraments are essentially instruments. In this conception, it is primarily Christ who baptizes, absolves, celebrates the Eucharist, heals, joins in marriage, ordains and so forth - a view echoed in the Anglican archbishop William Temple's insistence that in ordination the minister acts as the representative of Christ, not of the Church. The effectiveness of the sacraments seems an immediate corollary of this conception, so that, if there is no obstacle on the side of the recipient, then the appropriately intended performance of the rite by ministers with appropriate authority must be effective for God to give grace, in the traditional phrase *ex opere operato* (that is, effective simply 'out of the work's having been worked'), although the fruitfulness of the grace is affected by the dispositions and prayer of the persons concerned.

This belief in effectiveness was what first made the notion of 'institution by Christ' pivotal, since evidently no merely human authority could arrogate to a human ritual (even granted appropriate intentions and ministers) certainty of being thus instrumental to an action of God. This consideration made Thomas Aquinas reject earlier ideas that some sacraments might have been instituted by the apostles or by the Church. He argued that such lesser authorities could no more do this than institute or alter the essential constitution of the Church. The list of

sacraments was supposedly compatible with many different explanations of how and when they were instituted. Aquinas, for example, distinguished the institution of a sacrament (the establishment of its power), its being published (perhaps by Christ instructing the apostles before his Ascension) and its being promulgated (made known to the whole world); the promise of the Holy Spirit without measure implied the completion of baptism in confirmation and the elevation of marriage, instituted at the beginning of mankind, to a sacramental means of grace. Which rites were actions of Christ and therefore effective was not held in doubt, only their mode of establishment.

The notion of ‘sign’ seems less problematic, and customarily two aspects were distinguished: matter (water, bread, wine, oil, the laying on of hands - that is, certain materials and actions with them) and form (what indicates the meaning of the actions, including the kind of minister required). But how the matter/form distinction applies in the cases of confession and marriage is obscure; where both the laying on of hands and the application of oil are used, which is essential has been disputed; and the Eucharist presents another difficulty, described in §2 below. Plainly, the form is paramount; but many obscurities arise of the kinds philosophy often finds in the areas of law and action (for example, how to distinguish the publicly recognizable context of words or actions, which determines ‘the intention of the rite’ - that is, the character of the action - from the private intentions of ministers or recipients). Problems are resolvable only by regarding the essence as lying in some action, an action by the doing of which grace is given, not in the applicability of this matter/form distinction. These distinctions, problems and approaches to resolution arise in considering the rituals of almost every religion.

The list of seven has a rationale in its relation to the universal structure of human life. However, its significance has always lain partly in what it excludes, for example, kings being anointed or crowned, monks and suchlike taking vows, places and objects being dedicated (except in the Eucharist). It also excludes all other public or private ritual postures, acts, ceremonies and processions, including those centred on sacred icons, statues or images. To distinguish them from the sacraments, they all are commonly grouped as ‘sacramentals’, along with various uses of candles, incense, ashes or water (except in baptism) - the last sometimes associated with natural springs and wells.

2 The Eucharist: presence and sacrifice

The Eucharist is described by Aquinas as the greatest of the sacraments because ‘it contains Christ substantially’. According to ancient Catholic and Orthodox tradition, what is sacramentally present and received under the forms of bread and wine is not bread and wine as such, but Christ himself, mysteriously present in his complete humanity. Receiving Christ’s body and blood is not itself the grace received, but only the means of grace. The aim is not cannibalism: Christ’s body is said to be present but ‘not in the way a body is in a place in its own dimensions’ (*Summa theologiae* IIIa, q.76, aa.3-6); therefore it is not available so as to be altered and consumed in physical nutrition. Rather the grace given is that of being ‘nourished with the divine life’, ‘divinized’, ‘made partakers of the divine nature’ (2 Peter 1: 4). Anscombe (1981) argues that it is a secondary question whether Christ, as wholly present in the sacrament, is thus present really or only symbolically or only in the act of reception; the primary datum is that in the Eucharist it is Christ himself - mysteriously present in body, blood, soul and divinity - who is the matter or means of grace, whereas in other sacraments it is only water, oil, the laying-on of hands, and suchlike. Describing the matter of the sacrament as ‘bread and wine’ is oversimple.

The philosophical difficulties in Catholic and Orthodox teaching are signalled by the absence of any positive ways of describing Christ’s mode of presence (the word ‘sacramentally’ tells us no more than the word ‘mysteriously’) or of describing the conversion of the bread and wine into Christ’s body and blood (denied to be an annihilation), beyond saying that they constitute a change in ‘reality’ or ‘substance’ (a ‘transubstantiation’). The use of the term ‘transubstantiation’ (Greek, *metaousiosis*) was ancient, recurring in the Fourth Lateran Council (1215), and not tied to Aristotelian doctrine, let alone to the contrast between essential and accidental predicates. The Council of Trent (1547-63) used the term ‘appearance’ (*species*), not the term ‘accident’, thereby implying no more than that the change concerned is knowable by faith alone.

However, such philosophical difficulties have been exacerbated by considering the aspect of presence out of its original context, namely that of a memorial (Greek, *anamnesis*). The Jewish conception of memorial is not of individuals gathered in an assembly each, in their individual minds, remembering the thing being remembered, but rather of laying this out in front of other people, the world or God - in the case of an action, it is more like

re-enacting it than doing anything merely psychological (etymologically, ‘re-member-ing’ is putting parts together again). Memorial is also the context for conceiving the Eucharist as a ‘sacrifice’, not in the modern sense of killing or mutilating something, but still in the sense of an offering, not just of ‘ourselves’, but of Christ - it involves pleading again in an unbloody manner the one bloody sacrifice of Christ on the cross. Dummett (1987) argues that the reality of the presence of the risen Christ is a condition of the objectivity of the memorial made, so we cannot make sense of the ancient understanding that the primary action of the Eucharist is the making of this memorial without registering that it was understood to require a real presence. The generic meaning of the word ‘sacrifice’ as ‘making holy’ or ‘separating from human use for divine use’ adds nothing, except in being one of a whole family of features anticipated in Jewish as well as pagan rites. In the Eucharistic memorial, Christ as having been sacrificed is presented, now risen, before the Father under the forms of food and drink; these forms mark this action as to be completed by Christ’s being received by the participants as food and drink, with all the symbolism of a shared meal and of being nourished, the participants being thereby also set apart for divine use.

Roman Catholic and Orthodox Christians reckon the Eucharist to contain, not just the pledge, but the reality of the incarnate Christ now risen, and so to represent and embody the change in the world brought about by the Incarnation - in Athanasius’ words, ‘God’s being made man in order that man might be made divine’. It was thus that the Eucharist with its many aspects first became envisaged as the Mystery constitutive of the Church.

3 Post-medieval developments

The primary feature of Protestant accounts was, while retaining the notion of outward signs of inward grace, to repudiate any *ex opere operato* effectiveness, and to make the receiving of grace wholly dependent on the faith of the recipient, the minister being the representative of the congregation rather than of Christ. Institution by Christ was now important only because obedience to explicit Scripture required it, not because the sacraments were actions of Christ in the Church. In the Protestant conception, a sacrament was a human work, of no intrinsic merit, so that efficacy lay only in faith in God, who instituted the sacrament; in the Catholic conception, by contrast, a sacrament was in itself a divine work, so that reliance on it constituted direct reliance on God rather than on one’s own psychological state.

Philosophical conceptions varied: Luther’s consubstantiation might seem only a slight variation on transubstantiation (the body of Christ co-present with the bread, as fire in molten iron, instead of taking its place), except it was conceived more as a temporary indwelling than a real change, the change not conceived as persisting after the ceremony; Calvin’s doctrine involves only a power (*virtus*) in the bread and wine, a power realized only in their being received in faith; Zwingli began by regarding the bread and wine as symbols of Christ’s body and blood, but later considered only the ceremony as a whole as significant, emphasizing its aspect as a community meal. Recent Catholic theology has added other non-realistic theories, such as transignification (criticized by Anscombe (1981) and Dummett (1987)), as well as attempts to explain how the non-empirical change of bread into Christ’s body can be ontological and real without being physical (for example, Schillebeekx 1968; Dummett 1987).

Twentieth-century Catholicism, transformed by Pius X’s drive for ‘frequent and even daily communion’ and Pius XII’s systematic emphasis on the people’s participating in more ways in every part of the liturgy, is now experiencing the resultant vernacularization initiated by Vatican II. This has dramatized the character of the sacraments as bringing people into relation to one another as well as to God. Each sacrament relates people to the Church in the same act as relating them to Christ, so that (for example) being joined or reconciled to Christ is being joined or reconciled to the Church. The Eucharist presents itself as constitutive of the Church. Vatican II situates both sacraments and sacramentals within the context of the Church as ‘Sacrament or instrumental sign of intimate union with God and of the unity of all humanity.’

4 General sacramentality of the universe

Their realistic standpoint with regard to the Eucharist, despite the absence of any satisfactory account of it, constitutes the high point in Catholic and Orthodox resistance to the desacralization of the world. In the lesser sphere of ‘sacramentals’, the numinous significance of icons for the Orthodox presents a dramatic case of the same resistance.

In the theistic perspective, God, as cause of being, immediately present in and upholding everything, is never an absentee. Therefore, within the world thus loaded with his presence and activity, there is always the possibility, through the Holy Spirit, of God's presence and activity taking forms beyond mere causation, forms richer in personal significance and power, and instanced not only in the sacraments but more widely. This perception appears in Donald Baillie's emphasis on the sacramentality of the universe (1957), and is given vivid expression in Gerard Manley Hopkins' poem 'God's Grandeur' (1877). The way God's immanence in all things makes all potentially open to religious significance has also been important for Christian understanding of very differently expressed ideas - for example, in Hinduism. It is the background for the permanent potential that nature and particular places have to arouse religious awe, a sense of the 'numinous'.

In the Catholic conception, relationship to God in any such rich mode of presence in creation is constitutive of relationship to the Church. God's giving grace is not limited to the sacraments, but the symbolism they embody signifies or explains the direction of the grace which he may give without them. What happens when a person receives grace by a sacrament is representative of what happens when the same grace is given without sacrament.

Within a dualist framework of thought, identifying the spiritual with the immaterial, the sacraments have been thought of as an accommodation of God's mode of action to the lowly body-and-imagination-bound character of the human soul, as if human worship and its expression were ideally purely verbal or intellectual. However, the sacraments can be thought of as reflecting God's express purpose in creating the physical universe; the human being's unitary psychophysical nature is not a weakness or a privation, but a source of enrichment, modes of worship include a physical aspect, and voluntary physical action often provides the most definitive expression of the human heart. Light, heat, the air, the sea, the heavens, food and water provide images pregnant with religious meaning, not to be disparaged in a false body/mind dualism, but integral to a rounded communication between God and the human race, the background to sacrament and sacramental alike.

Saint-Simon, Claude-Henri de Rouvroy, Comte de (1760-1825)

An influential French social theorist, Saint-Simon propounded a philosophy of history and an account of the future organization of industrial society. He predicted a 'golden age', where harmony between individual capacities and social structures, reflected in a reordering of 'temporal' and 'spiritual' power, would overcome disorder and banish idleness. He has been variously portrayed as a utopian socialist, the founder of sociology and a prescient madman.

Saint-Simon's life was eventful, even if the more apocryphal details of the hagiography transmitted by his followers - including his descent from Charlemagne, being tutored by d'Alembert, childhood imprisonment, and marriage proposal to Madame de Staël - are omitted. As a commissioned French officer he participated in the American Wars of Independence, was wounded and imprisoned by British forces, and commended for bravery by the American government. Following his release, Saint-Simon pursued an unsuccessful canalization project in Panama before returning to France. During the Revolution, he (prudently) renounced his title, underwent a 'republican baptism', and made (and subsequently lost in litigation) a fortune speculating on the property market - his brief incarceration during the Terror was the result of mistaken identity. From 1802 Saint-Simon devoted his energies to developing and promoting his distinctive views on social organization in a torrent of books, pamphlets, prospectuses, articles and letters. The interpretative difficulties created by the diversity of these projects are compounded by the frequency of joint and disputed authorship, his opportunistic willingness to adapt his emphasis to imagined audiences as varied as the European proletariat and the French king, and the indifference to consistency that accompanied his predilection for descriptive detail. His productivity was punctuated by an unconsummated and hastily terminated marriage, a period in a private mental hospital, trial and acquittal on charges of subversion, and a suicide attempt (involving seven shots to his head) which resulted in the loss of his right eye.

In advocating a 'science of social organization', Saint-Simon depicted himself as emulating physiology in applying the methodology of the natural sciences - basing arguments on 'observed and examined facts', rather than revelation or deductions from reason - to the study of humankind. History, he claimed, was driven by the progression of the human mind, in which successive advances in understanding are embodied in a (twelve-stage) chronological narrative. In its most schematic form - as promulgated bySaint-Amand Bazard - history is structured into 'organic' epochs (in which ideas and institutions are in harmony) divided by 'critical' interludes (where social arrangements lag behind the progress of intellect). Development proceeded from the ancient and Christian worlds (grounded in polytheism and theism respectively), through the contemporary period of transition, to a final 'golden age' of industrialism (founded on positive science). The role of human agency was limited to hastening the arrival, rather than determining the content, of 'the perfection of the social order' that lay ahead.

'Social physiology' revealed inequalities in human nature, both between 'Africans' and 'Asians' (the 'descendants of Cain') on the one hand and 'Europeans' (the 'children of Abel') on the other, and within the latter category, where one of three capacities - emotive, rational and motive - would typically predominate within any particular individual. This psychology motivates the class structure of industrialism in which social differentiation according to capacity - into artists, scientists and 'industrials' (the latter group including wage labourers and owners of capital) - is functional to both the individual aim of fulfilment (since 'every citizen must naturally tend to confine himself to the role for which he is most suited') and the social goal of production (which requires the invention, examination and execution of useful projects). Saint-Simon portrays the shared ends of industrial society in moral terms, but reduces morality to the general happiness which is in turn identified with productivity - 'work is the essence of all virtues'. The same reductive strategy defines society as 'the ensemble and union of men engaged in useful work', describes individuals as free when they are 'unrestricted in productive work', and reveals 'true equality' as consisting in an individual's right to benefits 'exactly proportionate' to the contribution of that person (and their capital) to productivity.

The universal human drive to seek power would in future be sublimated, deflected away from immoral and destructive expression in conflict between individuals and into a cooperative victory over nature. Politics would be transformed into a positive science, developing 'laws of hygiene' to eradicate idleness ('a state of sickness in

man'), whilst 'government' would transmogrify into a much reduced 'administrative' structure facilitating production (divided accordingly into Chambers of Invention, Examination and Execution). His scientism and belief in natural inequality led Saint-Simon to assign 'temporal power' to those most competent to exercise it (the most successful 'industrials'). 'Spiritual power' would be the responsibility of a clerisy of scientists and artists, providing the moral and educational leadership necessary for social stability. Initially Saint-Simon advocated a 'Religion of Newton', with its own forms of worship and dogma, as an alternative to Christianity (optimistically suggesting that existing clergy might retrain for the new order). Increasingly, however, he portrayed his 'holy enterprise' as embodying the 'true spirit' of a Christianity uncontaminated by the heresies of the Church. This 'New Christianity' would utilize rhetoric, music and imagery to 'fill the souls of the faithful with feelings of terror or joy' designed 'to direct their ardour…towards works of general utility'. Institutionalized cooperation between the 'temporal' and 'spiritual' powers of Europe would lead to a confederation 'without wars, catastrophes or political revolution', in which a 'new family sentiment of Europeanism' would supersede competing patriotisms.

Saint-Simon's legacy resists summary. Any adequate account would include and assess his impact on his distinguished and estranged secretaries (Auguste Comte, Augustin Thierry) and claims of influence upon a succession of renowned social and political theorists (John Stuart Mill, Karl Marx), writers (Heinrich Heine, George Sand) and musicians (Franz Liszt, Hector Berlioz). The Saint-Simonian 'movement' did not survive intact in France, but fractured into the worldly and messianic currents that Saint-Simon had sought to incorporate. The achievements of the former, a distinguished group of engineers, mathematicians, economists and bankers, include the Suez Canal Company, the Paris-Lyon-Méditerranée railway and the Crédit mobilier. The latter, a more wayward group under Père Enfantin, scandalized Paris with the elaborate public rituals of their community at Ménilmontant and talk of an androgynous (and seemingly lascivious) God, before embarking on a crusade to North Africa in search of the 'Female Messiah'.

Salvation

For there to be such a thing as salvation, there must be someone to be saved, something from which they need to be saved, and some way in which they can be saved from it. 'Salvation' is primarily a religious term, and religious traditions typically assume that there is some basic religious problem that all people face. Monotheistic religions (for example, Judaism, Christianity, Islam, Viśiṣṭādvaita and Dvaita Hinduism) whose central doctrine concerns God conceived as Creator and Providence take this basic problem to lie in the fact of sin. Human persons have sinned (knowingly acted against the will of God) and sinning has become habitual. Thus there is need for forgiveness and reformation, which are available only in God's gracious pardon and restorative power. People can receive forgiveness and reformation through repentance and faith. Salvation by sheer self-effort is impossible. Nonmonotheistic traditions (for example, Buddhism, Jainism, Advaita Vedānta Hinduism) take a particular sort of ignorance to be the basic problem. The ignorance in question involves having false beliefs about the nature of persons and their cosmic environment. The proper treatment and cure is the achievement of an esoteric religious experience in which calm and bliss are accompanied by an understanding of the true nature of reality. The different traditions give very different accounts of what this nature is. Thus religious traditions differ greatly in the ways in which they conceive persons, their basic religious problem, and the proper treatment and cure. Secular notions of salvation, as in classical Marxism, tend to be secularizations of one or another religious conception - in the Marxist case, of the notion of the Kingdom of God.

1 Indian Buddhism

According to Indian Buddhism, there is a cycle of birth and rebirth in which every person participates; the cycle is beginningless and, unless one becomes enlightened, endless. There is a law of karma: one's misdeeds yield bad consequences for oneself, and one's good deeds yield good consequences for oneself. These consequences frequently come in a later life than that in which one performed the original action. Life in this cycle is inherently unsatisfactory, so the basic religious problem is that of escaping the round of birth and rebirth. The way to do so is through having a pre-*nirvāṇa* enlightenment experience in one's present life, which prepares one for release from the cycle and entry into *nirvāṇa* upon one's (next) death.

To prize anything in the reincarnation cycle more than escape from that cycle is, for reincarnation traditions, the height of folly. A person who enjoys the best of earthly conditions and fails to see that they are momentary and meaningless compared to the value of escape and enlightenment is desperately ignorant.

The natural world (roughly, the set of objects of sensory experience) does not consist of mind-independent, enduring physical objects. Rather, it consists of either physical (nonconscious) states or mental (conscious) states with perceptual content; in Theravāda Buddhism - the 'tradition of the elders' - it is held to consist of both, whereas in Mahāyāna Buddhism - the 'greater vehicle' (as contrasted to Hīnayāna, the 'lesser vehicle', Mahāyāna's term for Theravāda) - it consists only of mental states. Perhaps more importantly, persons themselves are nothing more *at* a given time than a bundle of states (conscious and nonconscious for the Theravādin, only conscious for the Mahāyānin), and *over* time they are nothing more than a series of such bundles. The idea seems to be that were persons more than this, enlightenment and escape from the reincarnation and karma cycle would be impossible. This tells us, then, the nature of what requires salvation according to Indian Buddhism, and what it needs salvation from (see Buddhist philosophy, Indian §§1-2).

The nature of salvation is another matter. What is it to be in the condition of having been saved? Buddhist salvation is a matter of becoming enlightened in this lifetime, which involves having an esoteric religious experience in which one comes to recognize the truth of the Buddhist account of reality, particularly concerning persons, and experiences calm and bliss. This experience in turn allows one release from the reincarnation cycle at death. For the Theravāda tradition, as for Buddhism generally, there is nothing permanent - nothing endures. Everything noncomposite that exists at a given moment exists only at that moment and everything composite either exists only at one moment or else is composed of elements each of which exists at only one moment. Further, every state or condition that can enter into the composition of a person is inherently unsatisfactory. Given these doctrinal claims, it follows that continued existence as a person inevitably involves continuing to have the basic problem that attaining *nirvāṇa* is intended to solve. Hence *nirvāṇa* will be extinction as a person; it will involve

extinction or annihilation of any state or series of states that could enter into the composition of a person. This is what Theravāda doctrine entails and what various texts seem to teach. This interpretation, however, is controversial, and *nirvāṇa* is sometimes said to be ineffable. For part of the Mahāyāna tradition, achieving a pre-*nirvāṇa* enlightenment state involves achieving a condition in which one is still composed of conscious states, but states which are not unsatisfactory. Hence the earlier claim that every state or condition that can enter into the composition of a person is inherently unsatisfactory is rejected. On this view, one who becomes enlightened will indefinitely postpone entering final *nirvāṇa* until the time at which everyone is able to do so, and it is sometimes held that this time will never come. Thus, on this account, whatever personal identity holds regarding a person within one lifetime can also hold over lifetimes after one has become enlightened, and over enlightened lifetimes in which none of one's composing bundles contains anything unsatisfactory. By contrast, Mahāyāna voidist tradition denies that even such persons as Mahāyāna idealism allows are anything other than illusory, and so takes the solution to one's religious problem to be that the problem, and those who have it, are themselves only illusory (see Buddhist concept of emptiness).

2 Jainism

Jainism holds that there exist a great number both of real (nonillusory) self-conscious substances and non-self-conscious substances. To be a substance is to be a possessor of properties, not to be a property oneself, to endure over time and to remain numerically the same through qualitative change. Indeed, Jaina mental substances are permanent and indestructible, and their goal is to escape being embodied because embodiment causes ignorance, namely the false beliefs that we depend on other things for our existence and could be destroyed, and that our knowledge is inherently limited. Each person or soul is eternally distinct from every other and from any physical (nonconscious) substance. Though the Jainas believe in individual immortality, they do not believe in a supreme deity (see Jaina philosophy §1).

The depth and importance of the difference between Buddhism and Jainism concerning the nature of persons is illustrated by one of their more important disputes. The Jaina objection to the Buddhist account of persons and karma essentially runs as follows. Justice requires that the same person who performs an action must reap the positive or negative karmic consequences that follow from it. According to the Buddhist tradition, a person at a time is but a momentary bundle composed of momentary states. Call this a single-time person; all there is to any person at any time is a single-time person. According to the Buddhist tradition, a person over time is a series of momentary bundles - a series of single-time persons - and so is what we might call a multiple-time person. Every action is performed at some time, and so is done by some single-time person. Every consequence is received at some time, and so by a single-time person. But since consequences typically take time to come along, the same single-time person does not both perform the action and receive the consequences, and justice is not served.

The obvious Buddhist answer is that it is enough to serve justice that the same multiple-time person include both the doer of the deed and the receiver of the consequences thereof. The Jaina response is that all there is to the multiple-time person at the time of the action is the single-time person who then exists, and all there is to the multiple-time person at the time of the consequences is the single-time person who then exists; multiple-time persons are agents or patients only in so far as their component single-time person parts act or receive. Single-time persons must *be* persons, or else agents are not persons. But then multiple-time persons are not persons in the sense in which agents are persons, but are classes of persons; single-time persons are persons in one sense (the basic) and multiple-time persons are persons in another (derivative) sense. If the person-in-the-basic-sense who acts is different from the person-in-the-basic-sense who receives the consequences of the action, then justice is not served.

Jainas, like Buddhists, hold that salvation requires the having of an enlightenment experience; this involves feelings of calm and bliss, and essentially includes a recognition of the correctness of the Jaina view of reality, particularly concerning persons. One who has such a this-life experience is released from embodiment and karmic obligations upon death. Personal identity is retained.

3 Advaita Vedānta

For Advaita Vedānta, a nonmonotheistic variety of Hinduism, ultimate reality, which does not depend on anything else for its existence, is nonpersonal and eternal, unchanging and permanent. The real self (*ātman*) of each person

is identical to this ultimate reality (Brahman-without-qualities). Having an enlightenment experience (*mokṣa*) involves realizing this truth, thereby escaping the reincarnation cycle, losing all individuality, and being ‘absorbed’ into Brahman. Here, in contrast to Jainism, personal identity is not retained. What was you, or seemed to be, no longer exists as you when final enlightenment occurs. Critics of this view point out that it means that there can be neither persons who have a basic religious problem, nor a problem for them to have - nor, of course, on this view can persons exist problemless (see Vedānta §1). Viśiṣṭādvaita Vedānta (whose major figure is Rāmānuja) and Dvaita Vedānta (whose greatest representative is Madhva) are monotheistic varieties of Hinduism that offer a very different account of the sacred texts to which Śaōkara, the most influential Advaita Vedānta philosopher, appeals.

4 Monotheistic traditions

Monotheistic traditions typically hold that God, an omnipotent, omniscient and morally perfect being, depends for existence on nothing else, and everything else that exists depends on God for its existence. Whether beginningless, or created *at* a time, or *with* time, the world exists by divine courtesy. Persons resemble God in ways that nonpersons do not, having some degree of knowledge, power and (potential) goodness. God is unique and holy, and, typically, in some sense the source of morality. For at least Semitic (Jewish, Christian and Islamic) as well as Hindu monotheism, God is characterized by unselfish love (see God, concepts of §§1-6).

According to these traditions, the basic religious problem all human beings face is that they have sinned - that is, they have knowingly acted wrongly against God’s will, and overrated their own significance while undervaluing the worth of others. Sin is not merely manifested in individual actions, but comes from a disposition towards wrong action that comes to lie deep in our nature. Our individual and collective existence is plagued by it; sin has social and institutional as well as individual manifestations. Thus there is a need for human repentance, for sorrow for one’s sins that includes the resolve not to repeat them, and for prayer for divine forgiveness. This prayer God graciously answers, enabling forgiven sinners to love others as they love themselves. Love in this sense is primarily volitional, not emotional, and involves concern for the ultimate good of the beloved, for which one is prepared to act sacrificially (see Sin §§1-2). Human individuality, then, is viewed as real, not illusory, and good. Finite persons typically are viewed, as in Jainism, as mental substances, but also, as in Buddhism, as not indestructible.

In Christianity, it is the incarnation, death and resurrection of Jesus Christ, God incarnate, that brings salvation. Christ lived a perfect human life as our example, died for our sins to make a just forgiveness possible and rose from the dead; the power to forgive and to progressively free us from the domination of sin is exercised through Christ’s life, death and resurrection (see Incarnation and Christology §1; Atonement).

Sin is not seen as the violation of arbitrary laws, but as a disposition (realizing itself in action) that thwarts one’s potential to realize one’s capacity to become as like God as is possible for a creature, and hence to fulfil one’s nature. It is in worship, obedience and service that one both shows love to God and becomes fully oneself. Creation in God’s image involves having an intrinsic worth that God sustains in existence. Hence, in the monotheistic traditions, personal identity is typically fully retained in the afterlife. Union with God is a matter of oneness of purpose, not of being. Salvation is seen as resulting in a personal relationship with God that occurs in the context of a redeemed community.

5 Agreements and disagreements

Semitic and Hindu monotheism, generally speaking, agree on these matters. For both sorts of monotheism, God is providential, though in Hindu monotheism this involves God governing the course of reincarnation and distributing karma with a justice tempered by mercy, whereas for Semitic monotheism, God’s being providential involves such actions in history as calling Abraham to be father of the nation of Israel, giving the law to Moses, sending the Old Testament prophets, becoming incarnate in Jesus Christ (for Christianity) and revealing the Qur’an to Muhammad (for Islam). (There are traditions associated with particular Hindu temples that Krishna, for example, appeared to someone and commanded that a temple be built at a particular place, but there is not the robust notion of God acting in history that characterizes the Semitic traditions, and no notion of God moving the course of history towards the Kingdom of God). For each sort of monotheism, worship is not a preliminary religious experience to be later transcended; its appropriateness is built into the nature of the distinction between

Creator and creature, which is not a dissolvable distinction. In Semitic, but not Hindu, monotheism central religious doctrines make essential reference to certain persons and events. For Christianity, God's becoming incarnate in Jesus Christ to die for our sins and be raised from the dead for our justification is an essential objective basis for divine forgiveness of the repentant.

There are similarities between Indian monotheistic religious traditions and Indian nonmonotheistic traditions. They agree that there is no movement of history towards an end or fulfilment. For Advaita Vedānta and Buddhist voidism, temporal and historical processes are illusory. For Buddhist idealism, historical events are all states within the minds of persons - parts of transitory bundles. For earlier Indian Buddhism, historical events include physical or nonconscious states, many of which do not belong to bundle-persons, but, like Jainism and Hindu monotheism, it denies that a providence guides those events to any historical conclusion or goal. All the Indian perspectives initially agree that the doctrines of reincarnation and karma are true, though some of them so radically reinterpret these doctrines as in the end to reject them. For no Indian tradition does basic religious doctrine essentially concern certain persons or contain essential references to places.

There are also differences between Indian monotheistic and nonmonotheistic perspectives. For the nonmonotheistic traditions, the basic religious problem is ignorance, not sin (there is no God to sin against), and the basic religious need is for enlightenment, not for forgiveness (there is no God to forgive). For Indian monotheism, it is sin that is our problem, and God's active forgiveness that solves it. For the nonmonotheistic traditions, religious knowledge is gained through meditation and through sacred texts that have no nonhuman personal source, not through revelation (there is no God to offer revelation). For Indian monotheism, Brahman is the source of all religious knowledge, scriptural or experiential. For the nonmonotheistic traditions, salvation comes through one's own efforts (there is no God to help). These are do-it-yourself religions: however necessary the aid of a teacher, guide or guru prior to one's enlightenment, it is one's own efforts that ultimately succeed or fail. For all of these traditions, it is in an enlightenment experience that one is said to learn the ultimate religious truth, and by having the experience one learns it in such a manner that one is transformed. But the truths that one is alleged to learn cannot all be true; at most one is. The claim is that enlightenment experience yields saving religious knowledge, not merely that it provides psychological certainty or great comfort. For monotheistic traditions, salvation requires that one repent of one's sins and seek God's forgiveness, and is constituted by one's flourishing in a community that lives in God's presence.

Sanches, Francisco (1551-1623)

Francisco Sanches was a sceptical philosopher and a professor of medicine at the University of Toulouse in southern France in the late sixteenth and early seventeenth century. He was born in Spain to a family of Jewish ancestry that had been forcibly converted to Catholicism, but he was brought up in France. Though he was a distant cousin of the sceptic Michel de Montaigne, he independently advanced what was perhaps the strongest sceptical critique of Aristotelianism and Platonism. In addition he developed a scepticism about mathematical knowledge claims. At the same time, he offered the first form of constructive scepticism, a way of solving intellectual problems without antecedently overcoming the sceptical challenge to traditional kinds of knowledge. He thus presented science as a way of dealing with experience, rather than as a way of gaining knowledge, and in this his views anticipate some twentieth-century philosophies. Sanches was also an important empirical medical practitioner, who presented the newest medical findings in his courses at Toulouse. His sceptical-critical views were influential in the first half of the seventeenth century, and were still being studied in Leibniz's time.

1 Life and works

Francisco Sanches (or Sánchez, though he is not to be confused with Francisco Sánchez de la Brozas (1523-1600), also known as Sanctius) was born in 1551 on the Spanish-Portuguese border to a family which had been very influential in Spain before the Expulsion of the Jews in 1492, and were now Marranos or New Christians (Jews who had been forcibly converted to Christianity). They first moved to Portugal and then, in 1564, to southern France in order to escape religious and political persecution by the Inquisition. The young Sanches studied at the Collège de Guyenne in Bordeaux, the same school that Montaigne had attended. After these studies he travelled in Italy for a while, visiting various universities there, and then settled in Rome. After two years of study at Rome with leading medical innovators who brought him into contact with new medical discoveries and theories, he went to the University of Montpellier, where he received a degree in medicine in 1574. After several years as a successful medical practitioner he was appointed first as professor of philosophy at the University of Toulouse in 1585, and then in 1612 as professor of medicine at the same university. He continued to work there until his death in 1623.

Sanches wrote extensively. The first of his philosophical writings that has survived is a letter to the Jesuit mathematician, Father Christopher Clavius, who had just edited Euclid's works, and whom Sanches had met in Rome. In the letter, Sanches offered a sceptical attack on the possibility of attaining genuine truth in mathematics. This was followed by his most famous writing, *Quod nihil scitur (That Nothing is Known)*, composed between 1574 and its first publication in 1581. Soon thereafter he wrote *Carmen de Cometa*, published in 1578, a critical examination in poetic form of the astrological interpretations of the comet of 1577. He also wrote some commentaries on portions of Aristotle's writings, as well as many medical works. Sanches criticized various Renaissance naturalistic views, such as those of Cardano (§§3, 6), and he may have actually debated with Giordano Bruno in person.

Limbrick's introduction to *That Nothing is Known* stresses how much of Sanches' limited sceptical view grew out of his lifelong medical work: 'it is the combination of two approaches to the theory of knowledge, the philosophical and the medical, which distinguishes Sanches' contribution to the history of ideas in the sixteenth and seventeenth centuries' ([1581] 1989: 25-6).

2 Attacks on Aristotle and Plato

The most important work of Sanches, *That Nothing is Known*, is perhaps the best technical exposition of philosophical scepticism produced during the sixteenth century (see Scepticism, Renaissance §5). Unlike other philosophers who were diffuse and digressive in their presentations of scepticism, appealing to the history of human stupidity and the variety of theories that have been accepted, Sanches instead systematically developed a radical sceptical critique of the Aristotelian theory of knowledge (see Aristotle §6), pointing out its many errors and inconsistencies. All sciences, he declared, begin with definitions. But these definitions are arbitrarily assigned to things without having any definite relation to them, and so they do not state the nature of things. Moreover, names keep changing. Hence when we think we are saying something about the nature of things by means of combining words and definitions, we are unfortunately just fooling ourselves.

This nominalistic thesis, when applied to Aristotle's view that science consists of knowledge that is certain, acquired by syllogistic demonstrations from true definitions, leads quickly to a scepticism about whether such knowledge can be achieved. As already seen, we do not possess true definitions, but only arbitrary ones. In fact, the particulars about which we are trying to demonstrate are better known than the general terms in the premises. Further, the syllogistic method of reasoning does not lead to any new knowledge. There is a vicious circularity in any knowledge claims based on demonstrative syllogisms, for the conclusion that is being proved actually constitutes part of the evidence for the premises. In order to demonstrate that Socrates is mortal, it is argued that all men are mortal and that Socrates is a man. However, the premises involve the conclusion, since the particular, Socrates, is needed in order to have a conception of man and of mortality. This criticism was later given by both Gassendi (§3) and J.S. Mill (§2) in their discussions of Aristotelian logic. Moreover, one could not have a true definition of the terms involved in the syllogism without already knowing their meaning, in which case one would not need the syllogism. On the basis of all this, Sanches said of Aristotle's notion of science, 'Do you call this science? I call it ignorance!'

Next Sanches contended that in a formal sense anything can be proved syllogistically if one just begins with the proper premises. Thus the fact that one can construct a syllogistic demonstration constitutes no indication that the conclusion of such a demonstration is true, for if the initial premises are carefully chosen, both true and false propositions can be proved in this manner.

Finally he attacked the Aristotelian claim that true knowledge is knowledge of things in terms of their causes. In order to know something in this manner one would have to know the cause of the cause as well, and the cause of the cause of the cause, and so on *ad infinitum*.

In his letter to Clavius, Sanches attacked a form of the Platonic theory of knowledge (see Plato §10). We cannot gain knowledge of things through mathematical study, since the objects studied by mathematics are not the natural real ones encountered in human life. Rather these objects are ideal, or perhaps even impossible ones, like points and lines. The mathematical relations that are demonstrated about such objects do not help explain anything in nature or experience, unless we happen to know independently that the experienced objects have mathematical properties, and also know that the principles of mathematics are in fact true. We cannot learn this from mathematics itself. So far as we can tell, mathematics is just conjectural or hypothetical until we can independently determine the nature of things.

3 Constructive scepticism

To replace the approaches that Sanches regarded as false conceptions of science, he insisted that true science is perfect knowledge of a thing ('Scientia est rei perfecta cognitio'). This conception, Sanches contended, was perfectly clear. Genuine knowledge is the immediate, intuitive apprehension of all of the real qualities of an object. Therefore true science will deal with particulars, each of which will somehow have to be understood individually. Any generalizations that go beyond this level of scientific certainty will introduce abstractions, fictions and so on. Scientific knowledge in its ideal form for Sanches would then consist of the experiential apprehension of each particular thing in and by itself.

None the less Sanches casts doubt on the possibility of such an experiential apprehension. At the beginning of *That Nothing is Known*, Sanches had said that he did not know if he actually knew anything at all. After casting doubt on whether anything can be known by using Aristotle's theory of science, Sanches then analysed his own view, and showed that in a strict sense humans are incapable of reaching any certainty at all. A full apprehension of objects which are known only one by one cannot be reached, in part because of the nature of objects, and in part because of the human being's nature. Everything is related to everything else, and therefore cannot be known individually. And there are an unlimited number of things, all of which are different, so they could never all be known. And, to make matters worse, things change. Thus they cannot be truly known since they never reach a final or complete state.

Turning to the human side of the question, Sanches spent much time discussing the difficulties that prevent human beings from obtaining true knowledge. Our ideas are dependent on our senses which are only capable of perceiving the surface aspects of things, the accidents, and never the substances. Appealing to his medical information Sanches was able to indicate how unreliable sense information is, how it changes as our state of health

changes, and so on. The many imperfections and limitations that God has seen fit to leave us with do, in fact, prevent our senses and our other faculties and powers from ever reaching true knowledge. All that we can attain is a quite limited, imperfect knowledge of some things which are present in our experience through observation and judgment. And, as Sanches seems to have found out through his medical studies and work, few scientists in fact make use of experience, and few persons actually know how to judge.

Sanches' sweeping negative conclusion that 'nothing is known' (*nihil scitur*), goes far beyond the Pyrrhonian balancing of opposing views and suspension of judgment offered by his distant cousin Montaigne. Yet Sanches' conclusion is the result of a most careful epistemological examination of the nature of our knowledge. Unlike the scepticism presented by Agrippa von Nettesheim (§3), which is destructive in its tendencies, Sanches attempted to state precisely what genuine knowledge would be, and then to show why it is not possible to attain this knowledge. He differs from both Montaigne (§§2-3) and Agrippa in that there is also a positive side to his work. He put forward a procedure which was not aimed at gaining knowledge, but at developing a way of dealing constructively with human experience. This procedure, which Sanches explicitly called scientific method ('método universal de las ciencias'), consists in patient, careful empirical research and cautious judgment and evaluation of the data observed. This would not provide, as his contemporary Francis Bacon (§§3, 6) thought, a key to knowledge of the world, but it would allow us to obtain the best information available. In advancing this limited or constructive view of science, Sanches was the first Renaissance sceptic to conceive of science in its modern form, as the useful activity concerning the study of nature that remained after one had given up the search for absolutely certain knowledge of the nature of things (see Scientific method).

Unlike other Renaissance sceptics, Sanches only briefly raises the fideistic solution to sceptical difficulties, the appeal to knowledge gained by religious faith alone. This lack of a serious presentation of fideism has led José Faur (1992) to suggest that Sanches was really secretly putting forth a non-Christian message, an assertion of his ancestral Jewish faith rather than the Christianity of the other fideists. Faur shows that Sanches' use of biblical material, together with his knowledge of early Jewish non-biblical literature could be taken to suggest that he was indicating his real beliefs. However, the fact that two of his sons became priests may be more indicative of Sanches' actual views.

4 Influence

Sanches had a good deal of influence in his own day and throughout the seventeenth century. *That Nothing is Known* was reissued several times up to 1665, and he is mentioned by quite a few authors, including Leibniz, who refers directly to some of Sanches' views from both *That Nothing is Known* and the letter to Clavius. People have seen possible influences on Descartes (§4), Gassendi (§3), Mersenne (§2) and Spinoza (§8), among others. However, in general it is hard to determine his exact influence as distinct from that of Montaigne, Sextus Empiricus, Cicero, Charron, and other available sceptical sources that were read by most intellectuals of the time.

Sanctification

Sanctification, the process of becoming holy, is closely connected to justification, although Roman Catholic and Protestant theologians differ on how closely. According to the Roman Catholic Church, sanctification takes place in justification. In justification, sins are forgiven and there is an infusion of sanctifying grace, whereby one is made just and holy; this is what it is to be sanctified. In this state of grace, one merits heaven. Nonetheless, there is room for spiritual growth in the Christian life (though this is not called sanctification, as it would be in Protestantism) because concupiscence remains and appetites are still not fully under control. Justification is the beginning of a new life (the life of grace) in which we may grow towards integrity, the proper use of appetites; moreover, the gifts of faith, hope and charity, which enable one to perform meritorious works, can also increase. The state of grace, which is the result of justification, can be lost by mortal sin, but can be fully restored through the sacrament of penance.

Protestants teach that in justification one's sins are forgiven and one is fully reconciled to God, but that one is not wholly sanctified (that is, renewed or made holy). Luther's formula that we are simul iustus et peccator *(both just and sinner) is widely accepted by Protestants. Justification is only the beginning of sanctification, which, most Protestants believe, is never completed in this life. The exceptions are Methodists and members of some holiness churches (groups that either broke away from Methodism or were influenced by it).*

1 The influence of Eastern Orthodoxy on the Western Church

The Orthodox Fathers never engaged in controversies over justification and sanctification comparable to those of the Western churches. Their debates concerning humanity's salvation focused on the nature and person of Christ, that is, on what Christ must be in order to effect salvation. At the Council of Nicaea (325) it was affirmed that Jesus is fully God and fully man. At the Council of Chalcedon (451) it was made clear that Jesus is the mediator between God and humanity because Jesus has two natures, a divine one and a human one. God saves his followers through the work of Christ, which is brought to fullness by the Holy Spirit. The teachings of these two councils were accepted as definitive by both the Roman Catholic and the Protestant churches. The outlook of the Eastern Church was summarized by Saint Athanasius in his *Incarnation*: 'He was made man that we might be made divine' (ch. 54: 3). That is, human beings, while remaining human, are able through union with the crucified and risen Christ to participate in the eternal (uncreated) life of God.

The Christian life, whether Roman Catholic, Protestant or Orthodox, begins with baptism, which remits sin and enables one to participate in the death and life of the risen Christ. What distinguishes the Orthodox Church is its focus on the Christian life as the increase of one's participation in the uncreated life of God; this process is referred to as *theiopoiesis* (divinization). The liturgy of the Eucharist (Holy Communion) is an eschatological event at which the present world and the world to come intersect. The congregation, in the presence of the risen Christ, the prophets, the apostles and the saints, has a foretaste of heaven. The Eucharist is often referred to as the 'medicine of immortality', whereby one is increasingly healed of the effects of original sin, which introduced death into human life, and is increasingly enabled to participate in the eternal life of God.

Eastern Orthodoxy deeply influenced the spirituality of the Western churches, largely through the ascetic practices of the Desert Fathers and Mothers (from the third century) and the mystical theology of Pseudo-Dionysius, who was active in the sixth century. Evagrius of Pontus summarized their ascetic practices in his *Praktikos (Practice)*. He distinguished eight deadly thoughts (gluttony, lust, avarice, anger, sadness, sloth, vainglory and pride), which are said to assail every Christian and which must be mastered so that one may obey Christ's commandment to love one's neighbour. Reading, vigils, prayer, almsgiving and fasting are particularly recommended as effective remedies for the passions they arouse. Once sufficiently freed of the distractions of the eight deadly thoughts by the development of *apatheia* (understood as purity of heart, and not as lack of feeling, as in Stoicism), Christians are able to practise the contemplative life. Contemplative prayer in particular increases knowledge and love of God, culminating, as Paul taught, in knowledge of God face to face (1 Corinthians 13: 12). The sixth-century Pope Gregory the Great, through his knowledge of John Cassian, a disciple of Evagrius and other Desert monastics, recast Eastern ascetic teaching for the Western Church; the eight deadly thoughts, for instance, became the seven deadly sins (lust, gluttony, avarice, sloth, wrath, envy and pride).

The teachings of Pseudo-Dionysius, first through Maximus the Confessor and then, from the tenth century, through a direct knowledge of some of his writings, brought into the Western Church the practice of an elaborate spiritual ascent into God, said to culminate for a very few Christians in mystical ecstasy. Some of the most important Western spiritual teachers that Pseudo-Dionysius influenced are Bernard of Clairvaux, Bonaventure (§§2-3) and Saint John of the Cross. John particularly stressed Pseudo-Dionysius' *via negativa,* in which all images and concepts of God are set aside as inadequate, and the 'dark nights' of purification, which enable one to ascend into mystical union with God. The most influential alternative to this speculative spirituality ('speculative' meaning knowledge of God as reflected in God's works and culminating in direct mystical knowledge of God) is the practical spirituality of Ignatius Loyola's masterpiece, *Spiritual Exercises*. Its practical nature lies in the stress on the discernment and pursuit of God's will for one's individual life.

All Christian spirituality uses the distinction between the active or ascetic life, and the contemplative life (see Asceticism). Thanks mostly to the influence of Pseudo-Dionysius, the contemplative life is usually subdivided, yielding the famous threefold way: the purgative way of ascetic practices, and the illuminative and unitive ways of contemplation. The way of illumination is an indirect knowledge of God through contemplation of God's two books: the book of nature, which reflects God's power, wisdom and goodness, and the book of Scripture, usually interpreted allegorically for hidden spiritual wisdom. The unitive way is a direct knowledge of God through such practices as the *via negativa* and prayer. The thirteenth-century writer Hugh of Balma's widely used terms, beginner, proficient and perfect, more or less correspond to the threefold way (to asceticism, the illuminative way and the unitive way respectively).

2 The Christian life in Roman Catholicism

The Roman Catholic Church clearly affirms that Christians grow in their participation in the divine life. Nonetheless, it placed its emphasis on the other aspect of the Christian life, namely the forgiveness of sin, which, by renewing one, puts one in a state of grace that merits heaven. The tradition of spirituality, with its stress on ascent to God, is primarily for those who have a special vocation. Even so, the central concern for all Catholics is to obey the teachings of Christ, which is possible through the infused grace of the sacraments. It is by participation in the sacraments that one grows in faith, hope and charity, and achieves greater integrity. But since one is not granted the gift of stability in the restoration from the Fall, there is a continuing concern to preserve the state of grace and to restore it whenever it is lost by mortal sin.

There is a strong emphasis on the objective character of the sanctifying grace that justifies. In justification, one is actually renewed and is just or holy regardless of one's psychological state. That is, one does not have to experience grace in order for sanctifying grace actually to have changed one's state from that of sin to that of grace. This affects pastoral practice, since there is a marked distance between the ontological condition of holiness and the actual experience of Christians. Although there is no theoretical incompatibility between doctrinal teaching on justification, spirituality and pastoral practice, the strong interpersonal nature of the Christian life with God (made possible by the indwelling of Christ) is in practice in danger of being neglected by the stress on sanctifying grace as objective, since the personal appropriation, however desirable, is not necessary.

In justification, one is just or holy by the standard of justice, because one has been actually renewed and made innocent. In the state of grace, one is able to perform actions which are meritorious (worthy of reward) according to the standard of justice; this is called condign merit. By good deeds, one may also merit an increase of grace in this life and a greater glory (degree of beatitude) in the next life (see Heaven §3); this is called congruous merit and, in contrast to condign merit, stems from divine liberality rather than justice. One may congruously merit special graces for oneself and for others, including the sanctifying grace of justification. These views on merit underlie the propriety of prayer for others.

3 Protestant views: Luther, Calvin and Wesley

Martin Luther has been widely misunderstood by both Roman Catholics and Protestants (including Lutherans) as teaching a view of justification that has no place whatsoever for sanctification. For Luther, in justification we are forgiven because Christ's righteousness is imputed to us. But unlike Roman Catholic teaching, we are not made holy or sanctified. Luther formulated his view as *simul iustus et peccator* (both just and sinner). But in theological polemics, it is little noticed that Luther held that justification is the beginning of sanctification, the beginning of

the reception of God's promise in Christ to establish his kingdom or rule in his followers. The coming of this eschatological fact into their lives is how Luther conceived of sanctification. Although they are forever inadequate according to the law (that is, they remain sinners because they are incapable of making themselves acceptable to God by their efforts), God in Christ makes life with God and in God possible. Whenever and wherever that life manifests itself, sanctification occurs. One has regeneration of one's life, with the eschatological reality of God's kingdom breaking into one's life.

Luther's conceptions of ordinary occupations as genuine spiritual vocations (with the rejection of the monastic or priestly life as spiritually superior) and justification by faith are hallmarks of Protestantism, marking it as sharply different from ancient and medieval conceptions of the Christian life. Furthermore, in order to avoid any suggestion that righteousness (justice, holiness) could be achieved by one's own efforts (by works), Luther also rejected any scheme of stages of growth for achieving sanctification. For Luther, there is no path or course that describes the Christian journey, a position which would include a rejection of the pre-eminently influential Protestant account, Bunyan's *The Pilgrim's Progress*. Yet Luther did not repudiate spirituality entirely, despite the rejection of stages of growth and of monasticism. On the contrary, he deeply admired *Theologica germanica*, an anonymous classic of spirituality written in the fourteenth century, and wrote that, next to the Bible and Augustine, he had read nothing more helpful and true.

John Calvin (§4) was in essential agreement with Luther, but unlike Luther he wrote extensively on sanctification. For Calvin, the issue of one's salvation is firmly and completely settled with justification. Although one's primary concern is to discern and do the will of God, one is still under the power of sin, with a will that resists God's will. Sanctification consists of the conflict between sin and grace, flesh and spirit, which lasts until the will becomes wholly subject to Christ's will. One then becomes free of the tyranny of sin and finds perfect freedom. In this struggle to become holy, one realizes how much one is utterly dependent on God's mercy. So although one can do good deeds, they are acceptable to God only because of God's liberality (this corresponds to 'congruous merit' rather than 'condign merit' in Roman Catholic theology). Calvin makes it clear that sanctification (actual regeneration and holiness), no less than justification (the gift of Christ's righteousness), comes to the believer from Christ. The two are distinct, but are not to be disjoined, since they both result from one's union with Christ.

Both Luther and Calvin agreed that, even though one is justified apart from the law, there are three valid uses of the law: enforced by the civil government, it permits civil society; it convicts one of sin; and it guides the life of believers in discernment of God's will. Both were opposed to an antinomianism in which it was inferred that since one is saved by faith alone, the law is not binding; however, both believed that through justification, one is motivated by love and not by compulsion to obey the law. The extensive debate between Lutherans and Calvinists over the third use of the law appears in retrospect to have been based on misunderstanding.

Unlike Luther and Calvin, John Wesley agreed with the Roman Catholic view that the gift of salvation can subsequently be lost. However, his main concern was the completion of salvation by achieving freedom from all effects of the Fall ('entire sanctification'). For him, the sanctification described by Roman Catholic teaching is not entire because one is not freed from all effects of sin (concupiscence remains), nor does one achieve perfection. It is difficult to tell what Wesley meant by the perfection he believed attainable in this life, but this belief divides him from Luther and Calvin, and Roman Catholicism. He clearly thought that there is an experience of sanctification in which there is a total death to sin and a complete renewal of the image of God. His various qualifications concerning the nature of perfection did not, however, weaken the Methodist stress that one must press on towards perfection in this life. Much of the social activism of Methodism sprang from this stress.

4 Pastoral psychology and sanctification

The nineteenth-century camp meeting revivals, with their stress on a 'born again' experience led Horace Bushnell to champion Christian nurture as the normal path to godliness. Through his reliance on modern pedagogical principles, including elementary psychology, he became the father of the Christian education movement. In Protestantism, Christian education continues to be the primary means for promoting spiritual growth.

In post-war years, the psychology of Sigmund Freud and, to a lesser extent, that of Carl Jung was adapted for the purposes of understanding and promoting spiritual development, especially in US Protestantism. It is generally held that the pastoral psychology movement has become increasingly in danger of complete secularization, losing

a transcendent dimension. Since about 1970, this has provoked a marked resurgence of interest in spiritual classics, because of their explicit stress on the work of the Holy Spirit in renewal, as well as new attempts to integrate spirituality and psychology.

Santayana, George (1863-1952)

George Santayana was a philosopher, essayist, novelist and poet. Born in Spain, he moved to America as a child and attended Harvard, studying under William James and Josiah Royce. The philosophical world first took note of Santayana for his work in aesthetics. The Sense of Beauty (1896), his attempt to give a naturalistic account of the beautiful, remains influential. He wrote exquisitely crafted essays on literature and religion, viewing both as articulating important symbolic truths about the human condition. His mature philosophical system is a classical edifice constructed out of positions adopted from Plato and Aristotle, which he modified in light of the naturalistic insights of his beloved Lucretius and Spinoza and steeped in pessimism reminiscent of Schopenhauer. Although in close touch with the philosophical developments of his day, he always viewed human life and its problems in a calming cosmic perspective.

1 Life and works

George Santayana was born Jorge Augustin Nicolas Ruiz de Santayana in Madrid, Spain, on 16 December 1863. At nine years of age, he accompanied his mother on her move to Boston. He attended Harvard University and studied with William James and Josiah Royce. Upon receiving his doctorate, he joined his former teachers on the faculty and rose to professor of philosophy. He never married, took early retirement from his teaching post and spent the last forty years of his life travelling and writing in Europe. He died in Rome on 26 September 1952.

Santayana's philosophical work is best understood in the context of the rejection of idealism at the beginning of the twentieth century. He was a realist in every significant sense of the word, believing that the world exists independently of human cognitive efforts and that not even the themes of thought we entertain depend for their reality on the human mind. Although his early, five-volume *The Life of Reason* (1905-6) has been compared to Hegel's *Phenomenology of Spirit*, the two works are fundamentally different. Santayana's philosophical edifice lacks Hegel's optimistic teleology, his devotion to totality and his structuring commitment to the power of consciousness (see Hegel, G.W.F. §5).

Beginning around 1920, Santayana developed an ontology designed to identify fundamentally different types of being. In *Scepticism and Animal Faith* (1923) and the much-misunderstood four-volume *Realms of Being* (1927-40), he attempted to show the ways in which essence, matter, truth and spirit differ from one another and are jointly adequate to account for everything in human experience and in the world. The terms in which Santayana cast his system derive from the great Western philosophical tradition. References to essence and substance may even make his writing appear scholastic. His message, however, is thoroughly modern, even postmodern, in its rejection of essentialism, of the possibility of certainty, and of a universal hierarchy of values.

2 Santayana's realism

Scepticism is irrefutable, Santayana argues, as long as knowledge is supposed to involve certain possession of its object. Such a stringent demand as this, however, commits us to a wrong-headed standard for cognition. In the affairs of life, we neither seek nor need assurance of the highest order. Accordingly, scepticism is defeated not by its logical weaknesses but by the irrelevance of the criterion it imposes on knowledge.

Santayana issues a call for honesty in philosophy, meaning by this the refusal to believe in our reflections what we would never countenance in daily life. This opens the door to a new method of doing philosophy and to a resultant system of ideas we might call 'the philosophy of animal faith'. The method consists of taking animal action as a starting point and attempting to disentangle the beliefs implicated in it. When animals eat, for example, they take the independent existence of their food for granted. Consciously or otherwise, they believe that what they eat is not a part of themselves, that it continues to exist even after it slips from sight, that they have the power to engulf it and that doing so is beneficial. The existence of a dynamic and enduring environment consisting of differentially powerful and desirable items is thus one of the beliefs involved in and justified by activities in which we all engage. The job of philosophy is to identify these beliefs and to present them as a coherent system of common sense.

What Santayana calls 'the discovery of essence', however, is often thought to be anything but common-sensical. But criticisms of the infinity of the forms of which the realm of essence consists are based largely on

misunderstandings. The essences he distinguishes do not *exist*: they are the qualities and relations, the structures and the event-types that may gain embodiment in the world. Santayana focuses on the ways in which these forms are different from the flux of physical events. As objects of thought, features of existence and terminal points of change, they remain free of the ravages of time. Their eternal self-identity renders them beacons in the turning world: they make temporal process possible without sharing its fate.

Essences are what the tradition has called ‘universals’. But since every distinguishable characteristic and the object of every possible thought is an essence, generic forms and the forms of natural kinds enjoy no privilege. This disintegrates the metaphysical, epistemic and axiological prerogatives of essences: if forms set the standards for being, knowing and the good, the infinity of essences means that we must choose which of a very large number of possible norms to embrace. Santayana accepts Aristotle’s idea that nature determines perfection. He thinks, however, that human nature is not defined by a single generic form, consisting instead of a vast continuum of the variously resembling forms of individuals. This leaves ample room for diversity and calls for choice in deciding which essence to enact.

Embodiment is the work of matter - a restless, mindless, impersonal force. Existence consists of a jostle of miscellaneous events: its external relations result from instantiating a shifting and arbitrary collection of essences. Santayana refers to the force of embodiment as a ‘whirlwind’ that creates ‘an insane emphasis’. Why there is something rather than nothing and why this world exists rather than some other are, therefore, questions that admit of no intelligible answer. Existence is a surd whose ultimacy cannot be eliminated by imagining a God who confers it as an expression of benevolence.

The realm of truth consists of all the essences that have been, are being and will be actualized in the history of the world. Truth is, in this way, a complete record of the agency of matter. Even if this realm contains an infinite number of forms, there remains an infinity never actualized. For if there is a monstrously complex essence that contains the form of everything that ever happened in the history of the world, there is another, unembodied essence differing from it in a tiny particular. In addition, there is an infinity of other forms that differ from it in indefinitely many ways.

Although this view of truth makes it eternal and unchanging, Santayana thinks that its tie to time cannot be severed. All truths relate to the changing world: only those essences that matter endows with external relations are members of the realm of truth. Santayana calls the truth about a fact its ‘standard, comprehensive description’. He does not mean by this, however, that it involves some actual description by a living being and thus that it belongs in the sphere of language or discourse. On the contrary, though it may be difficult to know, it is altogether objective and independent of what anyone says or thinks. It is the standard against which such thoughts are measured and is a ‘description’ only in the sense of being the total embodied form that may be described.

3 Values and spirituality

‘Spirit’ is Santayana’s word for consciousness, which he thinks is a product of biological causes. The immediate objects of consciousness are the nontemporal qualities and relations that belong to the realm of essence. Animal eagerness takes the presence of such themes in consciousness as signs of surrounding things. Perception and the knowledge of the world it makes possible are, therefore, always symbolic: they involve the use of present essences in deciphering the nature and causal powers of the substances on which our weal and woe depend. Such knowledge is never certain. Continued experience can correct it and successful action serves as its final criterion. The growth of knowledge in this way expresses the interests of the animal and not the intrinsic nature of awareness.

Consciousness in its purity pays no heed to animal life and knowledge. It finds no essences more worthy of attention than any others; it enjoys the presence of every form with equal readiness. By the claim that spirit is intrinsically spiritual Santayana means that it naturally transcends the concerns of daily life to engage in the carefree contemplation of eternal forms. This is ‘pure intuition’, a moment of aesthetic vision in which, as he puts it, the ultimate becomes immediate.

The spiritual life is not an existence that rivals successful rational life in this world. It consists of pure intuitions that can be had anywhere because their objects may be any of the infinity of essences. The only requirement of this achievement is that we liberate ourselves from animal concern and attend to the intrinsic features of what is

present, rather than to its causal or cognitive properties. This stress on the enjoyment of immediacies connects Santayana to the long history of spirituality and to such modern advocates of aesthetic immediacy as Schopenhauer (see Schopenhauer, A. §5).

What generates and justifies this account of ultimate human satisfaction is Santayana's view of the impotence of consciousness. He thinks that awareness is epiphenomenal, a 'lyric cry in the midst of business'. Although a product of the human nervous system, it is ontologically different from anything material and can wield no formative power. Its only function is to light up the realm of forms and, in the process, to enable us to enjoy things under the form of eternity. The transcendence it offers has a material ground and natural limits: spirituality is a perfection of this life, not the promise of another (see Epiphenomenalism).

Intuition of essence does not yield knowledge. The immediate objects of consciousness are universals and it takes animal faith to convert the colours and sounds that appear to us into signs of a surrounding world. Perception is veracious when the direct object of mind is an apt symbol of the features and movements of matter. This critical realism sees the identity of the essence we intuit with the essence embodied as a limiting case of knowledge; it is not necessary for cognition, we can probably not achieve it, and even if we did, we could have no valid evidence of it. There is little need of literal knowledge so long as the symbols we use help us live successfully.

Santayana's conviction that one's good is determined by one's nature is not enough to lead him back to Greek virtue ethics. He rejects the tidy universality that imposes a single perfection on all humans or even on all the members of a community. Working on the assumption that the role of the moral philosopher is to understand, not to condemn, he insists on the internal justification of every coherent life and unified set of values. The personal good is relative to the nature of the individual and the social good to the natures with which a community endows its members. The great problems of human life derive not from wickedness but from the clash of incompatible commitments, from internal confusion about the good and from the militancy that attempts to impose alien values.

By the time of his death, the loss of interest in systematic philosophy fostered by logical empiricism sent Santayana's popularity into decline. But the last two decades of the twentieth century witnessed the rediscovery of his thought. He is valued not only for his sharp insights, but also for his tolerant understanding of the varieties of human perfection. His naturalistic ontology is strikingly contemporary and his realism can serve as a welcome counterweight to prevailing historicist and constructivist positions. His categories offer a sensible and unified picture of the world, along with an account of human life that is free of illusions. His greatest contribution may be the way in which he combined an uncompromising naturalism with the highest demands of spirituality.

Śaōkara (early 8th century)

Śaōkara has been a highly influential figure in Hindu philosophy and religion from his lifetime (early eighth century; traditionally 788-820) to the present day. He is the most renowned teacher of nondualist (Advaita) Vedānta, which emphasizes realizing the nondual reality, Brahman, through hearing and contemplating the Upaniṣads, sacred knowledge which reveals the nature of human existence and the cosmos. Unlike many Western thinkers, who consider themselves forward-looking individuals putting forth new insights, Śaōkara is self-consciously part of an ongoing tradition committed to scriptural exegesis. He honours prior teachers (such as Gauḍapāda), and his own writings are primarily explanatory commentaries on sacred Vedānta texts. Śaōkara also requires certain purifying qualifications to pursue liberation, and vigorously contests other views prevailing in his time.

1 Life and works

The traditional Advaitic account of the life of Śaōkara (Śaōkarācārya) is as follows: born a Brahman in Kaladi, South India, he was a worshipper, and reputedly an incarnation, of Śiva. Becoming a renunciant when still a youth despite his mother's wishes, he went to Banaras to study and teach. During extensive travels, he set up monasteries in the four corners of India and founded an ascetic order with ten divisions. He debated with (and often converted) scholars of other religious sects and philosophical schools, both Hindu and Buddhist. Although he is said to have died at the age of 32, his Advaita Vedānta philosophical school and the renunciant Brahmanical tradition continues, from immediate followers such as Sureśvara and Padmapāda to contemporary teacher-leaders called Śaōkarācārya ruling most prominently at the Śṛōgeri and Kanchipuram monasteries in South India.

Śaōkara's primary writings include commentaries on a number of Upaniṣads (such as the Bṛhadāraṇyaka, Chāndogya and Taittirīya), Bādarāyaṇa's *Brahmasūtra* (concise aphorisms on Brahman which attempt to explain and show the coherence of Upaniṣadic teachings while refuting other views), and the *Bhagavad Gītā*, the immensely influential poetic discourse found in the *Mahābhārata*. He also wrote an independent philosophical work, the *Upadeśasāhasrī*, and is said to have composed many devotional hymns (*stotras*) to Śiva, though his authorship of these writings is contested by many scholars.

2 Śaōkara on Brahman

Throughout his writings, most notably in comments on *Brahmasūtra* 1.1.1-4, Śaōkara holds that Vedāntic texts teach that the basis of reality is nondual Brahman, which is eternal, qualityless (*nirguṇa*) and pervades everything without limitation. It is the single, efficient, substantial and conscious cause of existence. Brahman is identical with our true unqualified and unchanging self (*ātman*), which is immediate, self-luminous and distinctionless consciousness. The *ātman* is 'intuited' as that pure subject prior to all particular contents of consciousness (and free from the limitations which condition waking and dreaming); it is sometimes called *sākṣin*, the self-luminous and unconditioned but passive witness. The self is undeniable and self-authenticating; one who doubts it in fact presupposes it.

Śaōkara's Advaita teaches that human beings normally suffer bondage to transmigratory existence (*saṃsāra*), which requires experiencing the fruits of all one's actions (karma) and thus repeatedly entering the cycle of rebirth. The delusive manifestation of diversity and change (*māyā*) appears due to beginningless ignorance (*avidyā*), which is the superimposition (*adhyāsa*) of illusory phenomenal diversity on *nirguṇa* Brahman. Brahman is, however, unaffected by the superimposition of objects and conditions upon it. The knowledge that *ātman* and Brahman are identical removes ignorance, and this removal brings liberation (*mokṣa*) from *saṃsāra*. Liberation is knowing *and* being Brahman, our original nature. Liberation has no beginning, end or degrees; it is not a place or an attainment. It is solely a change in understanding through the removal of ignorance, not a product or result of any action.

Śaōkara's well-known introduction to the *Brahmasūtra* commentary states that ignorant beings such as ourselves have a general sense of the pure subject, nondual Brahman, but then, from the memory of a thing previously experienced elsewhere, we erroneously superimpose objective limiting conditions on Brahman, and properties of Brahman on limited, unconscious objects. We begin to identify all things as 'I/mine' or 'other', oblivious to the

ultimate nondifference of subject/object and knower/known. Through this natural and eternal *adhyāsa*, we falsely suppose that we are finite and embodied agents and enjoyers (called *jīvas*), but neither *jīvas* nor the world are truly real. Śaōkara calls the *jīva* a reflection of the self, like an image of the sun reflected in a pool of water; changes or imperfections in the reflection do not affect the source. Inquiry into Brahman is necessary and proper because Brahman is now known imperfectly, and there are many mistaken opinions about it (such as regarding it as a body, agent or momentary entity). Śaōkara concludes that Vedānta study should be begun to remove the error of superimposition and to realize the unity of the self.

An obvious problem here is how to explain the common-sense perception of duality. Śaōkara relies on the idea of two levels of truth, one apparent, known as practical or 'everyday' worldly activity (*vyavahāra*), and the other the higher nondual reality indicated in the Upaniṣads. Śaōkara does not merely dismiss the everyday activity of *vyavahāra*, sphere of reasoning and experience. He claims that despite lacking ultimate reality, objects appear - thus, they are neither existent nor nonexistent. *Vyavahāra* is real as far as it goes; those in it should follow the ritual and social order according to *dharma* (though without attachment to results) to prepare properly for liberating knowledge. He often describes delusive everyday appearance as being like a rope mistakenly seen as a snake due to superimposition - the snake is never there and never different from the rope (see Error and illusion, Indian conceptions of §1). Still, unreal imaginings (snake, *vyavahāra*) are based on a real substratum (rope, Brahman). Śaōkara's 'realism' also asserts that waking experience is normally true on its own terms, and dreams are mental creations less real than, and largely derived from, waking. On the other hand, both these states are shown to be false by the highest truth, and he praises deep sleep as suggestive of Brahman: luminous, serene and objectless bliss.

For Śaōkara, then, we are always Brahman, but do not know it - just as the 'snake' is always the rope, but we realize that only after being told. Still, according to Śaōkara, some things in the realm of ignorance, such as the Upaniṣads and wise teachers, can move us towards higher knowledge. One can in fact be liberated while living, but the knower remains in a body as long as needed to experience currently manifesting fruits of actions, as one temporarily continues trembling even after realizing the 'snake' is but a rope.

Perhaps one of Śaōkara's strengths is that he does not feel obliged to resolve all the difficult philosophical problems his outlook raises. This is but one manifestation of his reservations about reasoning and the need for reliance on scripture. He is not deeply concerned with how diversity arises from unity, and he acknowledges that why superimposition takes place, or exactly how Brahman and ignorance are related, is ultimately inexplicable. Neither does he resolve whence ineluctable karma arises, or whether karma limits Brahman. He asserts that such issues are only relevant to those caught in *vyavahāra* and cannot be understood until ignorance ends.

3 Qualifications for pursuing liberation

Śaōkara holds that one must be qualified to attain liberation. In commenting on *Brahmasūtra* 1.1.1, he describes four personal or psychological requirements for pursuing knowledge of Brahman: discriminating between non-eternal and eternal things, detachment from enjoyments here or in the afterlife, serenity and control of mind and senses, and desire for liberation. He implicitly endorses the later formula which states that one must hear, reflect on and meditate on Vedic texts.

In addition, and contradicting modern claims of Advaitic inclusivism, Śaōkara held that access to the Veda (the source of liberating knowledge) is externally or socially restricted. That is, in everyday reality Śaōkara remains committed to Brahmanical orthodoxy, which stresses the caste system and the importance of Vedic duties and right action according to *dharma* as a preliminary leading to renunciation and knowledge. Since only higher-caste males can hear the Veda, no women, low-caste or outcaste men may get the proper training which brings liberation, a state that Śaōkara generally seems to hold can only be gained as a male Brahman renunciate.

4 Śaōkara on other Indian schools

While Brahman is one, it has many manifestations. Śaōkara recognizes a lower Brahman 'with qualities' (*saguṇa*), often called *īśvara* ('lord'). *Īśvara* is omnipotent and omniscient, and the efficient and material cause of world appearance, creating due to motiveless play. Despite *īśvara*'s relative inferiority, Śaōkara holds that belief in and devotion to *īśvara* is acceptable as a preliminary to, and helpful auxiliary on, the path to liberation. Worshipping a

god may lead one to the path of the gods, but not to liberation; that is, it may lead to the heavens and a better rebirth as a high-caste renunciate, well-placed to pursue *mokṣa*, but it does not lead directly to the ultimate end.

Śaōkara's Vedānta is sometimes called the later (*uttara*) Mīmāṃsā, or Exegesis (of Brahman), to differentiate it, but show its indebtedness to, earlier (*pūrva*) Mīmāṃsā (of *dharma*), which explains duties described in the ritual-oriented portions of the Veda (see Mīmāṃsā). Śaōkara repeatedly rejects the Pūrva Mīmāṃsāview that actions are necessary or sufficient to bring liberation; he argues that the works portion of the Veda, which contains injunctions about rituals and social duties, is inferior to the knowledge portion, which makes statements about Brahman. As stated earlier, release comes from knowledge of nondual Brahman alone (and this knowledge is not an action); actions cannot affect or purify the self. Performing Vedic rituals and caste duties may, like worship, lead to prosperity, increased purity or better rebirth (which make one eligible for knowledge). Still, only Brahman knowledge, eternally present and not dependent on human activity, can bring final liberation. Even yogic meditation, which stills the mind, cannot bring liberation; it is a humanly dependent action and presupposes duality.

Despite major philosophical differences with Pūrva Mīmāṃsā, Śaōkara largely shares its commitment to textual exegesis, its modes of argumentation, and its understanding of the means of knowledge (*pramāṇas*). For the highest truth, Śaōkara holds that the most important means is Vedic text (*śruti* or *āgama*), which is eternal and transcends human senses and reason. While *pramāṇas* like sense perception and reasoned inference are generally valid and legitimate in their own (duality-based) sphere, they are relevant only to the ignorant *vyavahāra*-bound being, and cannot reveal nondual Brahman on their own. Although Brahman is not directly communicable in language, even by scripture, the Vedāntic texts are vital since they inform us about Brahman and evoke an immediate intuition of it through identity statements like *tat tvam asi*, 'you (*ātman*) are that (Brahman).'

Śaōkara's writings reveal him to be a superb debater and polemicist. He generally puts forth the opponent's view (*pūrvapakṣa*) and then counters with his response, which brings the correct conclusion (*siddhānta*). His commentaries often include critiques of other philosophical schools of his time, attempting to show Advaita's coherence and the incoherence of his opponents, particularly Sāōkhya and the Sarvāstivāda and Vijñānavāda schools of Buddhism. He focuses on issues concerning causality. For example, Śaōkara generally agrees with the Sāōkhya view (called *satkāryavāda*) that an effect pre-exists in a cause (like a pot is 'in' a lump of clay); otherwise, events could happen randomly and anything could arise anywhere. However, unlike Sāōkhya, Śaōkara holds that change in form is not real transformation, but only appearance; that is, the unchanging cause (Brahman, clay) merely appears as an effect (*māyā*, pot), and is unaffected by the latter's impurities (see Causation, Indian theories of §§3-4; Sāōkhya §5).

Later schools, within and outside Vedānta, engage extensively with Śaōkara's ideas (see Rāmānuja; Madhva). There are also many modern interpreters of Śaōkara's Advaita; some, such as Swami Vivekananda and Sarvepalli Radhakrishnan, have been influenced by Western thought, and claim Śaōkara as an ecumenicist, reformer and 'philosopher' (see Ramakrishna movement). While it should be acknowledged that great thinkers allow for many readings, readers should be wary of how some modernize Śaōkara's views to fit the temper of other times.

Sāōkhya

Considered one of the oldest classical Hindu schools by Indian tradition, Sāōkhya is most famous in Indian philosophy for its atheism, its dualist model of puruṣa *(passive, individual consciousness) and* prakṛti *(nonconscious, cognitive-sentient body) and its theory that effects pre-exist in their cause. In its classical formulation the* puruṣa-prakṛti *model is analysed into twenty-five components (*tattva*) intended to encompass entire metaphysical, cognitive, psychological, ethical and physical worlds in terms of their embodiment as individual constituents and the creative and interpretive projection of those worlds as experience by and for individuals. Both the world and the individual, in other words, are considered a phenomenological refraction and projection of the underlying and constitutive components of the conscious body.*

Falsely identifying with the cognitive and sensory components of prakṛti *(which according to orthodox Sāōkhya performs cognitive and sentient operations, but is bereft of consciousness;* puruṣa *alone is conscious), Sāōkhyans believe themselves to be the agents of their actions, rather than recognizing that actions are processes lacking any selfhood. Sāōkhyans claim that liberation from the suffering of repeated rebirths can only be achieved through a profound understanding of the distinction between* puruṣa *and* prakṛti. *The latter is not abandoned after liberation, but continues to operate, observed with detachment by* puruṣa. *However, according to some versions of Sāōkhya,* prakṛti *eventually becomes dormant.* Puru ṣa *and* prakṛti *both are considered to be eternal and to have no beginning. Since liberation is achieved through knowledge, Sāōkhya stresses the importance and efficacy of knowledge over ritual and other religious endeavours.*

Sāōkhya is cognate to saōkhyā, *meaning 'to count' or 'enumerate'. Thus Sāōkhya seeks to enumerate the basic facts of reality so that people will understand them and find liberation. Basic Sāōkhyan models and terms appear in some Upaniṣads and underlie important portions of the epic Mahābhārata, especially the Bhagavad Gītā and Mokṣadharma. No distinct Sāōkhyan text prior to Īśvarakṛṣṇa's Sāōkhyakārikā (*c.*350-*c.*450) is extant. It enumerates and explains the twenty-five components and a subsidiary list of sixty topics (*ṣaṣtitantra*), which are then subdivided into further enumerative lists. Most of the subsequent Sāōkhyan literature consists of commentaries and expositions of the Sāṃkhyakārikā and its ideas, which continued to be refined without major alterations well into the eighteenth century. Sāōkhyan models strongly influenced numerous other Indian schools, including Yoga, Vedānta, Kashmir Shaivism and Buddhism.*

1 Historical overview

Sāōkhya claims origins in remote antiquity, identifying its founders with names found in the Vedas - the earliest Indian texts (*c*.2000-*c*.800 BC) - such as Kapila and Āsuri, but nothing in the early material points to these people as having particularly Sāōkhyan views. Some Sāōkhya texts assert that its teachings predate the Vedas. Kauṭilya's *Arthaśāstra* (*c*.300 BC) mentions Sāōkhya as one of the leading teachings of the day. The epic *Mahābhārata* (*c*.400-200 BC) contains sections revealing a sophisticated, elaborate Sāōkhyan system. In one section, the *Mokṣadharma*, the basic system of twenty-five components is already found, along with a twenty-six component system, adding a universal single *puruṣa* as the twenty-sixth item. This universal, cosmic *puruṣa*, or 'ultimate self', was retained in the Yoga school, which in many other respects developed parallel to Sāōkhya. The *Mahābhārata*'s most famous section, the *Bhagavad Gītā*, not only presents a detailed discussion of early Sāōkhya theories, but structures its characters and plot to reflect those models. Both sections, emphasizing the indispensability of knowledge, use the terms 'field' and 'knower of the field' as synonyms for *prakṛti* and *puruṣa* respectively. The Buddhist poet Aśvaghoṣa, in his *Buddhacaritam (Life of the Buddha)* (first to second century), treats Sāōkhya thought as one of the formative teachings studied by the Buddha on his way to enlightenment, suggesting that by Aśvaghoṣa's time there already existed a developed Sāōkhyan tradition considered ancient and influential even by its opponents.

Orthodox Sāōkhya begins with Īśvarakṛṣṇa's *Sāōkhyakārikā*, which synthesized centuries of conflicting Sāōkhyan speculation. Its seventy verses (although the number varies in different commentaries) concisely presents the models, terminology, arguments and systematic configurations that were to be definitive for Sāōkhya from that time on. Virtually every subsequent Sāōkhya text is a commentary on either the *Sāōkhyakārikā* or the *Sāōkhyasūtra* (about fifteenth century). The latter itself is considered to be an expanded, reorganized version of the

Sāōkhyakārikā. The many dozens of commentaries written over the centuries reflect the changing concerns and growing sophistication of Indian thought. While some of the commentaries display clever strategies and great erudition, and minor points are continually being redefined and reinterpreted, the basic parameters set by Īśvarakṛṣṇa are scrupulously followed. The same stock arguments and examples invariably appear century after century in every commentary (Mainkar 1964; Raja 1963) - sometimes with embellishments - but there are no truly creative innovations to the system itself.

The earlier commentaries endeavour to deploy the latest developments in Indian epistemology and argumentative discourse to defend the statements of the *Sāōkhyakārikā* from actual and possible objections. The later commentaries make increasing concessions to non-Sāōkhyan ideologies, often to the point of subverting or reversing the point of distinctive Sāōkhyan teaching while attempting to retain the terminology and basic structure established by Īśvarakṛṣṇa. While orthodox Sāōkhya claimed individuals possessed their own distinct *puruṣa*, later commentators sought to ground this multiplicity of selves in a universal single self. Orthodox Sāōkhya denied the existence of God, but some later commentators reinstated God, or encouraged their readers to reject Sāōkhya's atheistic claims. These later concessions, whose most important advocates were Vacāspati Miśra (ninth to tenth century), Aniruddha (fifteenth century) and Vijñānabhikṣu (sixteenth century), were not so much efforts to change or reform the Sāōkhya system as attempts to make Sāōkhya palatable to contemporary audiences or promote reforms in the non-Sāōkhyan ideologies of the day to which these commentators owed their true allegiance. They may have been emboldened by the Yoga School (whose classical text is Patañjali's *Yogasūtra*), which unlike Sāōkhya, accepted the existence of God who was identified as the best of the *puruṣas*. Yoga also rejected the Sāōkhyan duality of *puruṣa* and *prakṛti*, claiming instead that ultimately the latter dissolves into the former.

2 *Puruṣa* and *prakṛti*

The term *puruṣa* originally meant 'person' and is used in the *Ṛg Veda* to signify the primordial, cosmic person from whom the universe is created (*Puru ṣasūkta* 10.90). As *Ṛg Veda* states, 'Two birds, inseparable companions, have found refuge in the same sheltering tree. One incessantly eats from the peepal tree; the other, not eating, just looks on' (I.24.7). This image of an inseparable dyad, one part actively engaging its appetites and appropriational desires and the other passively observing the activity of the first part, prefigures the notion of *puruṣa* and *prakṛti*.

In Sāōkhya *puruṣa* signifies the observer, the 'witness'. *Prakṛti* includes all the cognitive, moral, psychological, emotional, sensorial and physical aspects of reality. It is often mistranslated as 'matter' or 'nature' - in non-Sāōkhyan usage it does mean 'essential nature' - but that detracts from the heavy Sāōkhyan stress on *prakṛti*'s cognitive, mental, psychological and sensorial activities. Moreover, subtle and gross matter are its most derivative by-products, not its core. Only *prakṛti* acts. *Puruṣa* and *prakṛti* are radically different from each other, although both are considered to be eternal, without a beginning and ultimately inseparable. Every person is constituted of conjoined *puruṣa-prakṛti*. Misunderstanding how these two aspects function and interrelate is the root cause of all problems. Liberation arises from properly distinguishing between them such that one ceases falsely to identify with the components of *prakṛti* as one's self and instead correctly understands that *puruṣa* is a dissociated watcher of the activities of one's *prakṛti*.

Primordially, *prakṛti* is composed of three primary strands or qualities (*guṇa*): *sattva*, which is light, clear, tranquil, joyous, kind; *rajas*, which is passionate, moving, dynamic, agitated, angry; and *tamas*, which is dull, inert, dark, depressed, stupid. Everything in the universe (except *puruṣa*) is composed of varying proportions of these three qualities. Physical objects, mental and emotional states, moral qualities, types of food and personality, for example, are all definable according to which quality predominates. *Rajas* and *tamas* signify the inertia of motion and rest, respectively. *Sattva* signifies the clarity and tranquillity that comes from 'rising above' the negative properties of the other two qualities. For example, by shaking up or moving (*rajas*) something sedimented, depressed, stuck (*tamas*), it may either return to *tamas* (resediment) or remain dynamic (*rajas*), or it may purify and become sattvic. A clear and peaceful condition, if disturbed by passion or violent activity, can transform into reciprocal anger and violence, or produce stupidity, depression and stubbornness. Such dynamics can be applied to psychology, politics, physics, soteriology, or any other field. The three qualities undergo perpetual transformation, those transformations being the empirical universe. The essence of the three qualities remains unmanifest, acting as the cause of the empirical world (manifest *prakṛti*) which, as effect, shares the same nature as its cause. *Sāōkhyakārikā* characterizes their function thus: *sattva* is illuminating, *rajas* is activating or

unfolding and *tamas* imposes limitations and restrictions. They are inseparable, like the wick, oil and flame of a lamp (*tamas*, *rajas* and *sattva*, respectively). *Sattva* and *tamas* are comparable to the Chinese principles of *yang* and *yin*, with *rajas* as the catalyst and dynamic agent that keeps the other two active.

Orthodox Sāōkhya analyses *puruṣa-prakṛti* into twenty-five fundamental components. One is *puruṣa*; the remaining twenty-four are aspects of *prakṛti*, each a further development or transformation of the three qualities. These twenty-five components account for the totality of the universe, as well as the components of each individual. The second component consists of the three qualities taken together, also called 'fundamental *prakṛti*' and the 'unmanifest'. The remaining components, lumped together as the 'manifest' are all formed from combinations of these three. The third of these components is known as *buddhi* which represents reflective discernment and discrimination. *Puruṣa* is most directly connected to *buddhi* through which it is aware of the activities of *prakṛti*. It is *buddhi*'s task to distinguish effectively between *puruṣa* and *prakṛti*. *Ahaṃkāra*, the fourth component, is literally the 'I-maker' or 'the constructor of the "I am"'. The 'I-maker' refracts the three qualities to generate the sensorium, which it then appropriates for itself, thus constructing a sense of subjective selfhood. Thus, it interprets the activities of the three qualities in such a way that it sees itself as the agent or origin of the experience or interpretive theory. It experiences the results as '*my* experience'. The intensity of its sense of self-concern disrupts and obscures *buddhi*'s understanding of its relation with *puruṣa*. The fifth component is the empirical mind (*manas*), which interprets the sensorium and coordinates the discrete sense fields, such as audition and vision, into coherent experience. The next five components are the sense capacities, namely, hearing, touching, seeing, tasting and smelling. The eleventh to fifteenth components are the five activity capacities, such as speaking, grasping, mobility, excreting and procreating. The next five are the subtle elements, such as sound, tactility, colour, form, taste and smell. The five gross elements, ether, air, fire, water and earth, represent the final five components.

3 *Buddhi*

Buddhi alone among the twenty-four components of *prakṛti* directly interacts with *puruṣa*. Orthodox Sāōkhya wishes to maintain a radical distinction between *puruṣa* and *prakṛti*, as well as a *prakṛti* that is fully cognitive, intellective, sensorially aware and active. At the same time it must also be nonconscious (*acetana*). The question of how *buddhi* can be rational, discerning, reflective, discriminative and cognitive and yet lacking consciousness is an interesting one. *Buddhi* must provide both the linkage or communication between *puruṣa* and *prakṛti* and yet generate the discernment that realizes their ultimate separation. Since Sāōkhyan soteriology relies on *buddhi* to discern that separation, and the relation between the radically incommensurate *puruṣa* and *prakṛti* resides in the function of *buddhi*, the coherence of the entire system rests on the coherence of the notion of *buddhi*.

Prakṛti is not 'insentient', since the senses and their functions operate entirely within *prakṛti*. The five sense capacities are said to possess 'bare awareness' of their objects (see Sense perception, Indian views of). The empirical mind is described as both a sense organ and a conceptualizer. The 'I-maker' generates the sense of subjectivity. *Buddhi* discriminates, decides, reflects and provides certainty.

Reserving conscious knowing exclusively for *puruṣa*, while assigning all cognitive, psychological and sensory activities to *prakṛti* only seems confusing, argues *Sāōkhyakārika*. This is because we transfer mistakenly the properties of one to the other due to their proximity: *prakṛti* seems to be conscious and *puruṣa* seems to be active, but in fact they are not. Iron becomes hot when in proximity with heat, but heat is not in its nature, they argue. *Puruṣa* and *prakṛti* support each other and are compared to the symbiosis of a blind man and a lame man. In order to travel, the blind man (that is, *prakṛti*), who cannot see where he is going can carry the lame man (that is, *puruṣa*), who cannot walk but can see and direct the blind man. Since directing a blind man may be construed as an activity and the blind man must be sentient to cooperate with and be useful to the lame man, this example confuses rather than clarifies the problem.

In the later Yoga system, which also adopted a version of the twenty-five components, *puruṣa* shines a light into *buddhi* which *buddhi* then disperses throughout the rest of *prakṛti*. In other words, *puru ṣa* infuses *prakṛti*. Thus the 'light' of reason, sensation and cognition in *prakṛti* is the refracted vision of *puruṣa*. Enlightenment and liberation are produced by realigning *buddhi* such that *puruṣa*'s light is reflected back into *puruṣa*, producing 'self-illumination'. This structure, however, is not entertained by Sāōkhya, according to which *puruṣa* is passive and thus can illuminate nothing. *Sāōkhyakārika* 33-7 explains its relation to *buddhi* in terms of a distinction

between the internal organs (*buddhi*, the 'I-maker' and empirical mind) and the external organs (the ten capacities, that is, five sense capacities and five activity capacities). The external organs only perceive objects in the present; the internal organs can also perceive objects in the past and future. All objects perceived by the external organs are also perceived by the internal organs. Although each organ is different as each is derived from distinct differentiations of the three qualities, together 'like a lamp', they illumine *buddhi* for the sake of *puruṣa*. This is so *buddhi* can provide *puruṣa* with every experience and differentiate the subtle otherness between *puruṣa* and *prakṛti*. Thus, *Buddhi*, both causes *puruṣa*'s suffering and effects its liberation (see Awareness in Indian thought).

4 Orthodox epistemology

Sāōkhyakārikā, like Buddhism and many other Indian schools, claims that the root problem as experienced is a profound sense of dis-ease and dissatisfaction (*duḥkha*) that can only be cured by knowledge. Some commentaries say this knowledge concerns the difference between *puruṣa* and *buddhi*; some say it is knowing the twenty-five components or the list of sixty topics. Sacrifice, ritual and scriptural remedies, the usual methods for an orthodox Hindu, are declared ineffective for anything except temporary rebirth in heaven. Moreover, those methods cannot guarantee success (for example, even authentic prayer and religious observance may not cure barrenness) and they often involve 'impurity' (the killing during sacrifice, the caste requirements to have intercourse with one's mate). Heavenly births and impurities both perpetuate the cycle of life and death rather than resolving it. Like Buddhists, Sāōkhyans consider existence in any realm into which one is reborn, whether human, or heavenly, to be transitory.

Sāōkhya accepts three means of acquiring knowledge: perception, inference and reliable testimony. Descriptions of all three vary. Among Īśvarakṛṣṇa's predecessors, Vārṣagaṇya (*c*.300-*c*.100 BC) reportedly defined perception as the function of sense organs; Vindhyavāsin (*c*.400-*c*.300 BC) added that valid perception was devoid of mental or linguistic construction. Īśvarakṛṣṇa added that perception ascertains specific and definite objects. The *Yuktidīpikā*, one of the fullest and most sophisticated of the commentaries on *Sāōkhyakārika*, further asserts that the instrumentality of perception (that is, the *pramāṇa*) is located in *buddhi*, but its results occur in *puruṣa*.

The discussions of inference also vary across the commentaries, reflecting developments in Indian logic (see Inference, Indian theories of). *Sāōkhyakārikā* cryptically states that inference is threefold, based on a mark and its antecedent mark. The *Sāōkhyavṛtti* (author and date unknown) describes the three types of inference as inferring from what precedes, for example, imminent rain from storm clouds; inferring the whole from a part, for example, inferring all sea water is salty by tasting one drop; and generalization, for example, inferring that because one tree is in bloom others must be likewise. The *Suvarṇasaptati*, a *Sāōkhyakārikā* commentary that only survives in a Chinese translation made by Paramārtha in the sixth century, states that inference is dependent on perception. It redefines the three types in the following terms: inference from what precedes means to infer an effect from the perception of a cause, that is, rain from a black cloud; inferring the whole from the part means to infer a cause from the perception of an effect, such as previous rain from a flood; and examples for generalization are self-evident. Gau ḍapāda (sixth century) in his commentary *Sāōkhya kārikābhāṣya*, for 'generalization' or 'general correlation' gives as an example seeing someone first in one place and then another, which denotes movement although the moving itself may not have been perceived.

This last example is important as orthodox Sāōkhya argues that merely because something is not perceived, this does not mean that it does not exist, as when one knows the Himalayas have a top without actually seeing it. Imperceptibles may be proven to exist through inference. Since Sāōkhyans are atheists, it is not God whose existence they are trying to prove but rather *puruṣa* and unmanifest *prakṛti*. *Sāōkhyakārikā* 8 states that *prakṛti* is too subtle to be perceived, but it is 'perceived through its effects'. Sāōkhyan arguments for the knowability of imperceptibles by means of inference are disappointing since they fail to distinguish between what is not perceived but in principle perceptible, and what is genuinely imperceptible. All their examples address the former variety. Even when the *Yuktidīpikā* records this objection from a Buddhist, its response continues to ignore the distinction.

The most repeated 'proof' for the existence of *puruṣa* is a questionable argument from design (for example, *Sāōkhyakārikā* 17). It states that the body, or *prakṛti*, like a bed, is composite in nature (implying it was put together), therefore it must be for something other than itself. The only existent other than *prakṛti* is *puruṣa*, therefore *prakṛti* and its operations must be for the benefit of *puruṣa*. There is a usual argument offered to prove that the imperceptible unmanifested three qualities are the cause of the manifest world. It is that an effect must be of the same nature as its cause and the effects of the three qualities are observable everywhere in the manifest

world, as everything can be seen as varying proportions of the three qualities. This is illustrated by an analogy of cloth and thread. Thread when woven becomes cloth, although in nature there is no difference between thread and cloth. Since for the Sāōkhyans the qualities function as material causes as well as efficient causes, they were satisfied with this argument, although the thread does not transform the manner posited of *prakṛti*. The *Yuktidīpikā* states that fundamental *prakṛti*, because it is too subtle lacks the 'function of movement', but instead has the 'function of transformation'. Transformation, it says, is when an object obtains new qualities without deviating from its essence. An example might be found in the way a piece of black *palāśa* wood becomes yellow because of exposure to heat and yet never stops being *palāśa* wood. However, the change from threads to cloth is certainly not a transformation in this sense.

The *Yuktidīpikā* describes the ten factors that constitute logical proof. These include five psychological 'conditions for an inference': desire to know, doubt, purpose, examining alternative possibilities, removal of doubts; and the five parts of an actual syllogism: thesis, reason, example, application and conclusion. The *Mātharavṛtti*, another *Sāōkhyakārikā* commentary, discusses the later Indian three- and five-part syllogisms in a manner consistent with their explication in Nyāya and Buddhism.

As for testimony or reliable authority, like most Hindu schools Sāōkhya accepts scripture and the testimony of a reliable person as valid means to knowledge. The *Yuktidīpikā*, for example, asserts that the legendary ancient preceptors of Sāōkhya, such as Pañcaśikha (mentioned in the *Mahābhārata*), actually perceived the effect in the cause so that the Sāōkhyan causal theory rests on their authority (see Testimony in Indian philosophy).

5 Causal theory

Sāōkhyakārikā holds that the effect pre-exists in the cause (*satkāryavāda*) in a latent or potential state, arguing that since something cannot arise from nothing, the effect must pre-exist. It further claims that all effects rely on a material cause. Things do not arise indiscriminately from just anything: certain types of causes produce certain types of effect, for example, cows do not give birth to puppies. Something can only produce what it is capable of producing and a producer can only produce what is capable of being produced; the nature of the cause is in the effect. The same text says elsewhere that all manifest things must have a single ultimate cause to avoid an infinite regress of causes and effects. This ultimate cause is *prakṛti*.

Other causal notions are found in the commentaries. Gauḍapāda's commentary states that each of the three qualities produces conditions conducive to the other two, as well as to itself: 'thus *sattva*, like a beautiful woman, is a joy to her husband, a trial to her co-wives and arouses passion in other men' (*sattva*, *tamas* and *rajas*, respectively). The *Sāōkhyasaptativṛtti* discusses two types of cause: productive causes, which entail fundamental *prakṛti*, *buddhi*, the 'I-maker' and the subtle elements and cognitive causes, which includes five types of misconception, twenty-eight types of dysfunction (of the sense and activity capacities, mind and *buddhi*), nine contentments, eight types of attainment and the cognitive constructions of the eight predispositions.

There are also various discussions on material, efficient and instrumental causes, but these are merely adopted from other Indian schools. Sāōkhya seemed more interested in specific causal sequences and correlations between its various enumerated lists than in an elaborate theory of causality itself. The *Yuktidīpikā* criticizes Buddhist 'momentariness' and the causal theories of Vaiśeṣika and Nyāya, but the arguments shed little light on causal theory in general (see Causation, Indian theories of).

6 Soteriology

Sāōkhyakārikā states that the purpose for which the experiential world is created by the conjoining of *puruṣa* and *prakṛti* is so that the former can 'see' the latter, and the latter can liberate or isolate the former. Everything *prakṛti* does, she does for the liberation of *puruṣa*: 'just as unaware milk operates as an efficient cause to nourish a calf, so does *prakṛti* operate as an efficient cause for the liberation of *puruṣa*' (*Sāōkhyakārikā* 57). As a dancer stops dancing once the audience has seen the performance, so does *prakṛti* stop after having illumined *puruṣa*. She, like a self-sacrificing mother, does everything for the sake of *puruṣa*, while *puruṣa* lends no assistance whatsoever.

The *Sāōkhyasaptativṛtti* declares that *buddhi* enlightens and attains liberation for *puruṣa*. Critics of Sāōkhya have been quick to point out that *puruṣa* is defined in *Sāōkhyakārikā* 19 as inherently liberated and indifferent to pain and pleasure, thus it should be in no need of liberation. Sāōkhya's response to this criticism again hinges on

buddhi, but with an additional notion known as the ‘predispositions’ (*bhāva*). The predispositions that bind and liberate are classified into three types and into eight types: the three are innate, natural and acquired; the eight are *dharma* (meritorious action), which leads to rebirth in a higher life, adharma (demerit), which leads to lower births, knowledge, which leads to liberation, ignorance leading to bondage, detachment leading to dissociation from the activities of *prakṛti*, attachment producing the cycle of birth and death, power conducive to controlling circumstances and impotence leading to loss of control. Innateness, acquisition, detachment leading to dissociation from activities of *prakṛti* and power conducive to controlling forces are considered sattvic; their opposites are considered tamasic.

The *Sāōkhyasaptativṛtti* defines the innate predispositions as *dharma*, knowledge, detachment and power; the natural predispositions are latencies that emerge at certain times in one’s life and the acquired dispositions are derived from learning the truth from a teacher. Gauḍapāda defines the innate as the eight predispositions constituting one’s inherent nature; nature is the eight dispositions resulting from previous lives and the acquired is the eight predispositions obtained by hearing the truth from a teacher. He adds that the predispositions reside in *buddhi* and shape the (gross) embryo. Of the eight, knowledge alone leads to liberation. To the extent that the other seven contribute to knowledge they are conducive to liberation, but only knowledge can effect release.

The predispositions and the subtle body cannot operate without each other. The subtle body is composed of the internal organs, the ten capacities and the five subtle elements. It does not experience anything, but is the repository that holds the predispositions. Impelled by these predispositions, the subtle body is reborn from life to life until the predispositions are eliminated by knowledge. The subtle body is neither a self nor invariant since it is perpetually being modified by the predispositions influenced by the fluctuations of *prakṛtic* experience.

Puruṣa, prior to liberation, watches *prakṛti*’s transformations and suffers the pain of old age and death. But those transformations are merely an unconscious movement, a dance designed to show *puruṣa* that in its own nature it is never bound or liberated. At the next stage, while ‘standing aside like a spectator, *puruṣa* views *prakṛti* who, having fulfilled her purpose, stops, turning her back on the seven forms’ (v.65), that is, all the predispositions except knowledge. Although *puruṣa* and *prakṛti* are still conjoined, no new creation is generated and no new predispositions are created. By the attainment of correct knowledge, the seven predispositions cease to cause further embodiment and yet, ‘like a potter’s wheel that continues to spin even after the potter has stopped applying force’, embodiment continues for a while. Having fulfilled its purpose, *prakṛti* ceases functioning, sometimes understood to mean that the qualities return to an equilibrium from which no further transformations emerge. Attaining separation from the body, *puruṣa* attains everlasting ‘isolation’ or ‘freedom’ (*kaivalya*).

Sapir-Whorf hypothesis

The Sapir-Whorf Hypothesis is a widely used label for the linguistic relativity hypothesis, that is, the proposal that the particular language we speak shapes the way we think about the world. The label derives from the names of American anthropological linguists Edward Sapir and Benjamin Lee Whorf, who persuasively argued for this idea during the 1930s and 1940s - although they never actually characterized their ideas as an 'hypothesis'. In contrast to earlier European scholarship concerned with linguistic relativity, their approach was distinguished by first-hand experience with native American languages and rejection of claims for the superiority of European languages.

Early in the twentieth century, American anthropologist Franz Boas (1858-1942) inaugurated an important expansion of scientific investigation of the languages of native North America. As part of a broad critique of nineteenth-century evolutionary arguments he stressed the equal value of each language type and their independence from race and cultural level. He argued that each language necessarily represents an implicit classification of experience, that these classifications vary across languages, but that such variation probably has little effect on thought or culture.

His student Edward Sapir (1884-1939) accepted the main thrust of Boas' position but came to feel that the closely knit system of categories in a language could represent incommensurable analyses of experience with effects on speakers' conceptual view points and aesthetic interpretations. Gestalt and psychoanalytic psychology and Sapir's own literary efforts also played a role in his thinking on this issue. Sapir's concern was not with linguistic form as such (for example, whether a language uses inflections or not), nor with linguistic content or meaning as such (for example, whether a language could refer to a particular referent), but rather with the formal organization of meaning characteristic of a language, the regular ways meanings are constructed (for example, grammatical categories and patterns of semantic composition). Despite the suggestiveness of his formulation, Sapir provided few specific illustrations of the sorts of influences he had in mind.

Benjamin Lee Whorf (1897-1941), a gifted amateur linguist independently interested in these issues as they related to the nature of science, came into contact with Sapir in 1930 and began developing these views in a more systematic way. He analysed particular linguistic constructions, proposed mechanisms of influence, and provided empirical demonstrations of such influences on belief and behaviour. However, his views on this issue are known to us largely through letters, unpublished manuscripts and popular pieces, which has led to considerable debate about his actual position. In this context, the one article on this issue prepared for a professional audience must be given special weight (see Whorf 1956).

Whorf argued that each language refers to an infinite variety of experiences with a finite array of formal categories (both lexical and grammatical) by grouping experiences together as analogically 'the same' for the purposes of speech. These categories also interrelate in a coherent way, reinforcing and complementing one another, so as to constitute an overall interpretation of experience. Languages vary considerably not only in the basic distinctions they recognize, but also in the assemblage of these categories into a coherent system of reference. Thus the system of categories which each language provides to its speakers is not a common, universal system, but one peculiar to the individual language, and one which makes possible a particular 'fashion of speaking'.

But speakers tend to assume that the categories and distinctions of their language are natural, given by external reality. Further, speakers make the tacit error of assuming that elements of experience which are classed together on one or another criterion for the purposes of speech are similar in other respects as well. The crux of Whorf's argument is that these linguistic categories are used as guides in habitual thought. When speakers attempt to interpret an experience in terms of a category available in their language they automatically involve the other meanings implicit in that particular category (analogy) and in the overall configuration of categories in which it is embedded. And speakers regard these other meanings as being intrinsic to the original experience rather than a product of linguistic analogy. Thus, language does not so much blind speakers to some obvious reality, but rather it suggests associations which are not necessarily entailed by experience. Ultimately, these shaping forces affect not only everyday habitual thought but also more sophisticated philosophical and scientific activity. In the absence of another language (natural or artificial) with which to talk about experience, speakers will be unlikely to

recognize the conventional nature of their linguistically-based understandings.

The ideas of Sapir and Whorf have attracted widespread attention in the humanities and social sciences. Their views have been important in leading many students into comparative linguistics and played a crucial role in giving rise to the field of psycholinguistics in the 1950s. Despite this wide currency, their views have not been subjected to much empirical research. In large part, acceptance or rejection of their proposals has had more to do with the personal and professional outlook of the investigator and the prevailing temper of the times than with any solid evidence. In particular, philosophical responses, whether sympathetic or derisive, have rarely engaged with real linguistic phenomena (that is, how languages actually differ) or with practical cognition (that is, what kinds of effects one might expect). Instead debate centres on the logical (im)plausibility of linguistic incommensurability and determinism.

Existing empirical research on Whorf's claims has consisted primarily of tests for a relationship between lexical or grammatical categories (for example, words for colour, number marking) and experimental assessments of patterns of memory and classification. There have also been some attacks on Whorf's particular evidence, especially his claims about the Hopi language. This empirical research remains controversial, but some results clearly support Whorf's proposals and none decisively contradicts them. Another important strand of thinking has considered whether diverse uses of language (in particular the specialized discursive forms associated with language standardization, literacy and formal education) might have effects on thinking either in their own right or by mediating the structural effects proposed by Sapir and Whorf. This research often focuses on the cognitive importance of decontextualized speech and on the nature of speakers' conscious awareness and control of language - this latter an issue of concern to Whorf himself. Direct empirical research on such possible discursive effects remains quite limited.

There is also a growing body of research exploring the historical development of Sapir and Whorf's views, including intellectual biographies, more complete collections of their works, and accounts of the relation of their views to earlier European thinkers, especially in Germany. It seems certain that they were aware of this earlier work: Boas trained in Germany, Sapir wrote a Masters paper on Herder, and both Sapir and Whorf explicitly reject Humboldt's main substantive thesis, though not by name (see Herder, J.G.; Humboldt, W. von). However, their work is better understood, as with the rest of twentieth-century American anthropology, as an innovative departure from Europeanist views stimulated by direct first-hand contact with native American languages and cultures in a context of an emerging non-hierarchical view of culture.

Sartre, Jean-Paul (1905-80)

Sartre was a philosopher of paradox: an existentialist who attempted a reconciliation with Marxism, a theorist of freedom who explored the notion of predestination. From the mid-1930s to the late-1940s, Sartre was in his 'classical' period. He explored the history of theories of imagination leading up to that of Husserl, and developed his own phenomenological account of imagination as the key to the freedom of consciousness. He analysed human emotions, arguing that emotion is a freely chosen mode of relationship to the outside world. In his major philosophical work, L'Être et le Néant (Being and Nothingness) (1943a), Sartre distinguished between consciousness and all other beings: consciousness is always at least tacitly conscious of itself, hence it is essentially 'for itself' (pour-soi) *- free, mobile and spontaneous. Everything else, lacking this self-consciousness, is just what it is 'in-itself'* (en-soi)*; it is 'solid' and lacks freedom. Consciousness is always engaged in the world of which it is conscious, and in relationships with other consciousnesses. These relationships are conflictual: they involve a battle to maintain the position of subject and to make the other into an object. This battle is inescapable.*

Although Sartre was indeed a philosopher of freedom, his conception of freedom is often misunderstood. Already in Being and Nothingness *human freedom operates against a background of facticity and situation. My facticity is all the facts about myself which cannot be changed - my age, sex, class of origin, race and so on; my situation may be modified, but it still constitutes the starting point for change and roots consciousness firmly in the world. Freedom is not idealized by Sartre; it is always within a given set of circumstances, after a particular past, and against the expectations of both myself and others that I make my free choices. My personal history conditions the range of my options.*

From the 1950s onwards Sartre became increasingly politicized and was drawn to attempt a reconciliation between existentialism and Marxism. This was the aim of the Critique de la raison dialectique (Critique of Dialectical Reason) *(1960) which recognized more fully than before the effect of historical and material conditions on individual and collective choice. An attempt to explore this interplay in action underlies both his biography of Flaubert and his own autobiography.*

1 Background

Sartre's prestige as a philosopher was at its peak, in France at least, in the late 1940s, in the aftermath of the Second World War, when a philosophy of freedom and self-determination fitted the mood of a country recently liberated from the Occupation. It was at its nadir in the late 1960s and 1970s when structuralism had discredited, temporarily, both humanism and existentialism, and proclaimed 'man' to be no more than a locus of forces traversed and indeed produced by social and linguistic structures (see Structuralism). The British analytic tradition has never had much time for the literary and dramatic aspects of existentialism and phenomenology, though some recent critics, such as Phyllis Morris (1974) and Gregory McCulloch (1994), have attempted to take Sartre seriously as a philosopher and to assess his contribution in terms more accessible to analytically trained minds.

The emotive responses tend in their different ways to distort Sartre's arguments and to focus, for example, on one of the poles of the many paradoxes which his philosophy implies. For Sartre is indeed a philosopher of paradox - deliberately facing his readers with logically 'impossible' or self-contradictory statements in order to force them to think beyond the confines of the binary oppositions to which common sense and analytic reason have accustomed them. For example, 'Man is what he is not and is not what he is' (1943a: 97), provocatively compels the reader who perseveres to confront the difficult issues of the relationship between essence, existence and negation. 'Man is what he is not', that is to say, man is a being without an essential nature, a being who operates through negation, who cannot be identified with his past, or indeed his present self, and so 'who is not what he is'.

1940s Paris overestimated Sartre's faith in human freedom and lauded him for it; 1960s Paris made the same mistake and discarded him along with all other relics of mid-century humanism. Neither period read Sartre carefully enough to recognize the constraints and limits within which freedom was, from the outset, deemed to operate.

2 Early philosophy

Sartre's first published philosophical works were *L'Imagination* (1936a), a history of theories of imagination up to

the theory of Edmund Husserl, and 'La Transcendance de l'ego' (*The Transcendence of the Ego*) (1936b). *The Transcendence of the Ego* shows hostility to any kind of essentialism of the self. In it Sartre argues (against Husserl) that the ego is not transcendental but transcendent, that is, it is not an inner core of being, a source of my actions, emotions and character, but rather a construct, a product of my self-image and my image in the eyes of others, of my past behaviour and feelings. Sartre maintains that consciousness is not essentially first-person but is impersonal, or at most pre-personal, and that it is characterized by intentionality, that is to say it is always directed at something other than itself. In this context Sartre positions himself in relation to the Kantian 'unity of apperception', arguing that although the 'I think' must be able to accompany all my representations, it does not always do so, at least explicitly. I may turn my attention at any moment away from what I am doing and direct it towards myself as agent, but this reflexivity is not a permanent, thetic feature of consciousness. Later, in *L'Être et le Néant (Being and Nothingness)* (1943a), Sartre claims that it is precisely this very reflexivity - the self-consciousness of consciousness - that personalizes consciousness and constitutes the human subject, but in *The Transcendence of the Ego* such a notion is absent and he is more concerned to argue against the identification of consciousness with selfhood than to explore the ways in which consciousness relates to the notion of subject.

In his *Esquisse d'une théorie des émotions (Sketch for a Theory of Emotions)* (1939) Sartre turns his attention to another area of human experience in order to show that this, in its turn, cannot be described in essentialist terms. Emotions, in Sartre's account, are chosen rather than caused: emotion involves a 'magical' attempt to transform reality by changing what can be changed (my own feelings) rather than what is less easily malleable, that is, the outside world. In the face of extreme danger I may faint from fear: the danger has not disappeared but I am no longer conscious of it. Sartre here takes a radical position which he maintained but modified in later years, as his recognition of the degree to which we are formed by external conditions gradually increased. He is careful to distinguish between various areas related to emotion - passion, feeling and so on. Emotion is not sustainable continuously through time, but is subject to fluctuations of intensity, and may at times be replaced by alternative feelings. In this sense too Sartre rejects essentialism: like Proust he believes in the 'intermittances of the heart': love, for example, is not a continuous emotional state, but an amalgam of affection, desire, passion, as well as, perhaps, jealousy, resentment and even occasionally hatred. Love is not the permanent compelling state we may like to imagine: it is the product of a decision and a commitment (see Emotions, nature of §4; Emotions, philosophy of §4).

These two works form the grounding for Sartre's early theory of human freedom along with a second work on the imagination. In *L'Imaginaire, psychologie phénoménologique de l'imagination (The Psychology of the Imagination)* (1940) Sartre picks up the threads of Husserl's theory of imagination and develops it further by showing how phenomenological psychology works in practice. Unlike traditional empirical psychology it is not based in a positivist methodology in which evidence depends on an accumulation of examples. The phenomenological method operates through a particular type of introspection or intuition in which the phenomenologist examines a single example, or a series of examples, of the phenomenon to be analysed (here imagination) and deduces from the example the general principles and features of the phenomenon. In this way Sartre describes what he calls the 'poverty' of the image - the fact, that is, that I can never find in it any more than I have already put there. If, say, I do not know the number of columns in the Parthenon, I can count them if I look at the temple in reality; if I merely imagine the temple the number of pillars will depend not on the real building but merely on my own implicit estimate. I cannot learn anything from imagination as I can from perception. But the reverse of this 'poverty' of the imagination is its *freedom* - in imagination I am not constrained as I am in perception by the material world around me. Indeed, imagination is not merely image formation - in Sartre's account it is itself constitutive of the freedom of consciousness. Without imagination we would be 'stuck in the real', unable to escape from the present moment of time and our immediate surroundings. It is imagination that allows us to step back from our material environment and take up an (imaginary) distance from it, in Sartre's terms to 'totalize' it, to see it as a 'world' with order and pattern. In *Being and Nothingness* Sartre will also maintain that the imagination is the source of the purpose and finality we see in the world, but *The Psychology of the Imagination* concentrates rather on the different functions of imagination and image formation in the narrower sense (see Imagery; Imagination §2).

3 *Being and Nothingness*

Being and Nothingness sets out the main philosophical tenets of the 'classical' Sartre. Being is subdivided, as it

were, into two major regions - being for-itself (*l'être pour-soi*) or consciousness, and being-in-itself (*l'être en-soi*) which is everything other than consciousness, including the material world, the past, the body as organism and so on. To being-in-itself Sartre devotes no more than six of his 660 pages; there is little to be said about it other than it is, it is what it is, and it is 'in itself'. Only through the 'for-itself' of consciousness does the 'in-itself' become a world to speak of. Indeed, Sartre argues, we cannot know anything about being as it is, only about being as it appears to us. It is through consciousness that the world is endowed with temporality, spatiality and other qualities such as usefulness. This is where the imagination in its broadest sense may be seen as primary: 'imagination is the whole of consciousness as it realizes its freedom' (1940: 236). Imagination makes a world of the 'in-itself', it totalizes and 'nihilates' it. Nihilation (*néantir*) is a term that is specific to Sartre, and means not annihilation but rather the special type of negation that consciousness operates when it 'intends' an object: it differentiates the object from its surroundings and knows itself *not* to be that object. But consciousness is not alone in the world it has created from the brute 'in-itself', indeed it has not created the world individually, but rather as part of an intersubjective community. And other people, or their consciousnesses, are not an afterthought for Sartre. Like Heidegger he sees man as always already engaged in relationships with others; unlike Heidegger he sees these not in terms of *Mitsein* (Being-with), but in terms of conflict in a manner reminiscent of the account given by Hegel of the relationship between masters and slaves. The other is in permanent competition with me. I wish to be a subject and make of the other an object, while he or she attempts to make me an object in my turn. In Sartre's account, this battle is the key to all human relationships, and not merely those which might appear conflictual, but also those of sexual desire and even love. Consciousness is engaged in a permanent struggle to maintain its freedom in the face of onslaughts from all sides.

These aspects of Sartre's early philosophy are probably the best known. Less familiar but no less significant are his accounts of the limits within which human freedom operates. The battle of consciousnesses is not disembodied, and my own body constitutes not only the condition of possibility but also one of the major constraints on my freedom. Consciousness and imagination are free, but they are free against a background of facticity and situation. Facticity in particular is rarely given due weight by exegetes of Sartre's philosophy. My facticity is all the facts about myself which cannot be changed - my age, sex, height, class of origin, race, nationality, for example. (Later Sartre comes to include in facticity more psychological elements of genetic or environmental origin.) One's situation may be modified, but it still constitutes the starting point for any change, and roots consciousness firmly in the world about it. All this means that the Sartrean philosophy of freedom is less idealized than it might at first appear. I am not free to change a whole multiplicity of aspects of my condition, and those I am free to change may not prove easy. As I live I create a self which does not bind me but which certainly makes some courses of action easier and more attractive than others. My own self-image and the image others hold of me also condition the range of possibilities open to me. I make a character for myself over the years, and though it is always open to me to act 'out of character' - after all it is a self I have constituted, not an essence I was born with - such a decision is not usually easy. Sartre describes this self-constitution in terms not so much of character as of 'project', each person having a fundamental project of being, which is not necessarily the result of a conscious decision, and possibly elaborated gradually over time. This project forms the core of a whole nexus of choices and behavioural decisions which form the totality that constitutes my self. My actions form a meaningful whole, each act relates to others before and since, and so the decision to make significant changes always comes up against resistance from already existent patterns and structures. Discussing, for example, an episode when a man gives up on a long hike declaring he is 'too tired' to continue, Sartre discusses the abandonment of the walk in terms of a project which does not put persistence in the face of setbacks at much of a premium. He 'could have acted differently, of course,' Sartre comments, 'but at what cost?' (1943a: 531). Our personal history does not eradicate our freedom, but in practice it is often easier to deny our freedom than to employ it. We hide behind the selves we have constructed, fearing change and convincing ourselves that our choices are limited. Freedom is threatening to us, it opens up a range of possibilities which we find daunting, and we flee from it in what Sartre calls 'bad faith'. Ideally we would like the positive aspect of liberty - free choice, a lack of constraints - together with the security and comfort of a fixed character or nature. The two are incompatible, and our desire to combine them is termed by Sartre a 'useless passion' (see Self-deception, ethics of §2).

In 1943, then, Sartre already sets freedom firmly against a background of constraint - constraints which arise from the features of the material world, from other people whose projects may not coincide with mine, from bodily existence, from facticity and from fear of freedom itself. Freedom is always within and starting from situation, and

it is on the determinants and conditioning power of situation that Sartre increasingly focuses in his later writings.

4 Literary works

The 1940s were the period of Sartre's most prolific literary production. From *La Nausée (Nausea)* (1938) which explores the relationship of contingency and necessity in life and art through the experiences of Roquentin, Sartre moves on in the war years to a contemporary trilogy *Les Chemins de la liberté (The Roads to Freedom)* (1945-9). The trilogy (or unfinished quadrology?) portrays the lives of a varied group of Parisian intellectuals at the outbreak of war, and in particular the ways in which they hide their freedom from themselves while convincing themselves that it is their ultimate goal. Mathieu, a university academic, is the main focus for such ambivalence as he tries to find money for an abortion for his long-term mistress Marcelle.

Sartre also wrote several very successful plays in this period - *Les Mouches (The Flies)* (1943b), a wartime allegory of resistance to German occupation, which uses the Orestean myth to explore the power of human liberty in the face of oppression. *Huis Clos (In Camera)* (1944) shows the deadly consequences of conflictual human relations and self-deception in a hell comprising three characters doomed to remain together for ever in a Second Empire drawing room. *Les Mains Sales (Dirty Hands, or Crime Passionel)* (1948) debates the issues of realism and idealism, means and ends, truth, lies and political commitment in Illyria, an imaginary Communist country in Eastern Europe. This finely balanced and complex play received an unexpectedly positive response from the bourgeois press who interpreted it, against Sartre's intentions, as predominantly anti-communist. In consequence Sartre felt obliged to ban its production for about ten years.

5 Later philosophy

The increasing politicization of Sartre's postwar writing meant that he left both literature and philosophy to one side in the 1950s as he became increasingly engaged as a writer, lecturer and public figure in concrete political issues and endeavours. His next major philosophical work, the *Critique de la raison dialectique (Critique of Dialectical Reason)*, did not appear until 1960 and is clearly marked by his increasing intellectual engagement with Marx. The *Critique* is an attempt to do the impossible: to reconcile existentialism and Marxism; to revivify Marxism, which Sartre believed was becoming sclerotic, by reawakening its awareness of individual and collective subjectivity; and to bring existentialism into closer contact with the material conditions of historical existence. Sartre examines social and political issues such as group action, historical change, revolution and behaviour in the face of material scarcity of resources. He modifies his radical position on the extent of human freedom by recognizing more fully than before the effect of historical and material conditions on individual and collective choice. He takes as his own the famous slogan of Engels: 'Men make history on the basis of what history has made them.' We are not pawns or cogs in a machine, nor do we simply participate in processes of internalization and externalization: we are free agents, but agents who are profoundly and inescapably situated in specific social and material conditions. Indeed Sartre later uses the (Jansenist) term 'predestination' to explain how his views differ from positivist theories of human determinism. Material conditions set up the environment in which we operate. They do not causally determine our behaviour, but they do prescribe the (limited) range of options open to us. A white bourgeois male in a prosperous suburb has a vastly wider range of choices on which to exercise his freedom than an elderly black women living in the poverty of an inner city ghetto. Both are free in the ontological sense, but their possibilities for making use of that freedom are not comparable. And in 1960 Sartre is as concerned with the restrictions imposed on freedom by the material world as with human liberty itself.

It is this preoccupation with the absolute and yet circumscribed nature of human freedom that underpins Sartre's two last major works: his autobiography, *Les Mots (Words)* (1963), a brief and finely wrought literary masterpiece, and *L'Idiot de la famille (The Idiot of the Family)* (1971-2), a 3,000-page biography of Flaubert which draws on a vast range of different disciplines. 'What can one know of a man, today?' was the question Sartre set out to answer in his account of Flaubert, and in it he synthesizes not only existentialism, phenomenology and Marxist theory and method, but also psychoanalysis, sociology, history of literature, aesthetics and anthropology. What did Flaubert make of what was made of him? Educated in a family embodying the historical conflicts of its age, second son of a doctor and expected to become a lawyer, the young Gustave Flaubert constructed a very different career for himself. Resistant to adult pressures to perform, he learned to read late (hence the *Idiot* of the title), lived in his elder brother's shadow and opted out of law school through a hysterico-epileptic crisis ('intentional' but not 'deliberate', in Sartre's terms) which made him an invalid - the 'hermit of Croisset' - and thus permitted him to

live in the family home and become a writer. Sartre's account of his own choice of the same career is more succinct and more ironic: the Sartre and Schweitzer (maternal grandfather) families are not spared in the biting and witty descriptions of the 'family comedy' which made of young Jean-Paul a precocious charlatan, writing to please adults, writing for future fame - a superman author - and finally writing as a professional. The gap between choice and destiny is shown to be very small, but it has not closed. Even when analysing with cruel perspicacity his own formation, Sartre maintains the framework he set up thirty years earlier: freedom within situation, even when the situation may leave little room for manoeuvre. Subjectivity is now defined as the *décalage* or difference between the processes of internalization and externalization; liberty may be no more than the 'play' in the mechanism, but the permanent dialectic between the poles of freedom and conditioning remains untotalized.

Saussure, Ferdinand de (1857-1913)

*Though he made a major contribution to the comparative and historical studies which dominated nineteenth-century linguistics, Saussure is best known today for the development of a radically different conception of language and of the methodology of linguistics which became central to twentieth-century structural linguistics. According to this conception a language is a system of signs which are radically arbitrary, so that their significations are determined only by the historically constituted systems of conventions to which they belong - such a system Saussure called '*la langue*'. It follows, therefore, that a linguistic study is first and foremost one of* la langue*, that is, of the conventional relations obtaining at a given time between signs belonging to the same system, rather than one of the development of linguistic forms over time, as the comparativists had maintained.*

1 The primary object of linguistic study

In the nineteenth century linguistics was dominated by comparative and historical studies the primary aims of which were to compare forms in different languages and to trace their development. The Swiss linguist Ferdinand de Saussure made a major contribution to these studies at the age of twenty-one in his *Memoires sur le système primitif des voyelles dans les langues indo-européenes (Memoir on the Primitive System of Vowels in Indo-European Languages)* (1878). However, he became increasingly dissatisfied with the assumptions made by these studies. In particular, they failed to ask fundamental questions: 'What is the primary object of a linguistic study?' and 'What is the nature of the object studied?' Saussure proposed novel answers to these questions in three lecture courses given in Geneva between 1906 and 1911. Unfortunately, he died in 1913 before he was able to publish his conclusions; the text by which he is best known, *Cours de linguistique générale (Course in General Linguistics)*, was reconstructed from his lecture notes by two of his pupils and published in 1916.

Saussure's argument about the nature of the object of linguistics is a complex one, in the course of which he develops a conception of a language as a social institution which is, at the same time, radically arbitrary. The starting point of the argument is a claim that for each language one can make a distinction between *la langue* (the language itself, for example, French or German) and *le parole* (its uses, the primary one for Saussure being speech). *La langue* is a system of conventions the knowledge of which enables speakers to communicate. It both logically precedes and is more abstract than *le parole*, since speech sounds, while being the primary means of its articulation, are nevertheless only one of its instruments. The existence of other instruments, such as writing, or the signs of a language for the deaf, show that what is natural to man is not 'oral speech but the faculty of constructing a language' ([1916] 1977: 26). Thus, to concentrate attention on speech sounds, or indeed on any other instrument of articulation, would be to neglect the underlying system (*la langue*) which makes articulation possible and is, therefore, both more fundamental and more abstract than any of its instruments of expression; in short, it is 'a form not a substance' (1977: 113). Since *la langue* is a system of conventions, it is inherently social, but it has no architect and so is not an intentional product. On the other hand, aspects of *le parole* - the uses of that system - such as the production of speech sounds, written texts or speech acts and so on, are individual acts or products which are typically intentional. Nevertheless, they are logically parasitic on the existence of an underlying system; for instance, without a conventional way of naming days of the week (a fact about *la langue*), one could not assert that today is Tuesday by uttering the words 'It is Tuesday'. So, Saussure argues, the fundamental study is one of *la langue*: '*from the very outset we must put both feet on the ground of language (*la langue*) and use language as the norm of all other manifestations of speech*' (1977: 9; original emphasis).

To appreciate the importance of Saussure's claim, and the distance which he had moved from the position of historical linguistics, it is necessary to consider at this point the other major distinction he introduced; that between 'synchronic' and 'diachronic' linguistics. One way in which he presents this distinction seems relatively unproblematic, involving no more than a difference, created by the inquirer's point of view, between studying something at a moment in time (a synchronic study) and studying it as it changes over time (a diachronic study). But his account of the distinction is misleading if it suggests that what is studied from the two perspectives is one and the same thing. On the contrary, Saussure maintains that one can study *la langue* only from the first perspective. By contrast, diachronic linguistics is the study of changing relations between individual items which, though they may impact on *la langue*, are not designed or intended by anyone to do so. They do not, therefore, form a system, so that 'there is no such thing as ''historical grammar''' (1977: 134). Moreover, Saussure argues,

before one can compare items belonging to different stages of a language one first needs to establish what the respective systems of conventions are or were, so that a synchronic study logically precedes a diachronic one. For instance, it is a synchronic fact that a number of English nouns mark the plural with a vowel change: ‘tooth’/‘teeth’, ‘goose’/‘geese’ and so on. This is a fact about the conventions of contemporary English, which is psychologically real for native speakers. On the other hand, it is a diachronic fact that this way of marking the plural was made possible by a series of purely phonetic changes which occurred previously; changes which were in no way designed or intended to make possible the modern way of forming a plural in the cases in question. So if we want to understand how plural forms are generated within a language, we can do so only by studying the language synchronically: ‘the linguist can neither describe it nor draw up standards of usage except by concentrating on one state’ (1977: 82). Hence Saussure’s conclusion that the fundamental linguistic study is a synchronic one of *la langue* - a root-and-branch rejection of the assumptions of nineteenth-century historical linguistics.

2 Language as a system of signs

Central to the argument underpinning this conclusion is Saussure’s theory of signs. For him each sign has two aspects, one acoustic, the other conceptual, and he designates them by the terms ‘signifier’ and ‘signified’ respectively. For example, an acoustic impression of an utterance of ‘cat’ is the word’s signifier, and, *as a first approximation*, its signified is the concept *cat* (see comments on values below). It is a fundamental principle that signs are arbitrary: ‘the signified ‘‘ox’’ has its signifier *b-ö-f* [*boeuf*] on one side of the border and *o-k-s* (*Ochs*) on the other’ (1977: 67). Saussure’s principle implies, of course, that the connection between a signifier and its signified is contingent; but it asserts more than that, namely that there are no extra-linguistic facts which determine either the existence of, or the relation between, a signifier and a signified. For instance, it is not because of facts about the structure of our eyes that we have the colour vocabulary that we have, nor because of facts about the structure of thought that we employ the linguistic categories we do. Thought without language is amorphous, so that ‘nothing is distinct before the appearance of language’ (1977: 112). The development of language does not involve, as some think, a naming ceremony at which signifiers are invented to correspond to pre-existing signifieds. Rather, the differentiation of distinct signifiers and signifieds has to proceed together.

However, Saussure argues, the differentiation has to proceed systematically: ‘the principle of the arbitrariness of the sign would lead to the worst sort of complication if applied without restriction’ (1977: 133). Numerical signs illustrate this point: ‘twenty-one’, ‘thirty-one’ and so on are constructed in a systematic way, and if this were not so it would not be possible to learn them all. Moreover, Saussure maintains that it is because a sign has a unique position in a system that we can identify occurrences of it. What makes two spoken occurrences of ‘Gentlemen!’ the same is not identity of sound or content, but the fact that each differs in the same way from instances of other English words - ‘in language there are only differences *without positive terms*’ (1977: 120; original emphasis). These differences depend on two kinds of relations that signs can enter into, called ‘syntagmatic’ and ‘associative’ respectively. The first kind of relation holds between a sign and the elements which can precede or succeed it; for example, there is a syntagmatic relation between ‘talk’ and ‘ing’ in ‘John is talking.’ The second relation holds between items which by virtue of a similarity in form or meaning can be substituted for each other in a range of contexts. For instance, ‘talking’ and ‘walking’ are associatively related because of similarities in form, while ‘talking’ and ‘speaking’ are related because of similarities in meaning. And since the *only* way to identify a sign is by identifying the syntagmatic and associative relations it has to other signs - so we know what it is not - signs present themselves as elements of a system and cannot be identified independently of it.

Hence, Saussure argues, signifieds cannot be identified, as we did as a first approximation, with concepts, for that would suggest that they have a content independent of the linguistic system to which they belong. Instead, they should be thought of as values which are wholly dependent on the system to which they belong. Colour words provide an illustration; for example, the English word ‘brown’ has no exact equivalent in French, since it can be translated as ‘brun’, ‘marron’ or even ‘jaune’ depending on context (Lyons 1968: 56). This makes it clear why a synchronic study of *la langue* is the primary study, since a study of values is a study of the system to which they belong.

3 Semiology and structuralism

The contention that linguistic units can only be identified as terms of a system is the central tenet of European

structural linguistics (see Structuralism in linguistics), a movement for which Saussure's work provided the foundations. However, not least because they were work in progress, his theories leave much scope for interpretation and for further development; for instance, there is no serious theory of *le parole* in *Course in General Linguistics*, though one was promised, and there is no *formal* account of the relations which signs can enter into, something which is particularly serious in the case of associative relations given the vagueness of the idea of a similarity of form or meaning. So there was much work still to be done by linguists both to develop and to explore the limitations of Saussure's ideas.

As well as its importance for the development of European structural linguistics, Saussure's work also had a much wider influence. The central importance which he gave to the theory of the linguistic sign led him to speculate whether that theory were not in fact an instance of a more general study of signs of any kind that express ideas: '*a science that studies the life of signs within society* is conceivable; it would be a part of social psychology and consequently of general psychology; I shall call it *semiology* (from the Greek *sēmeîon* ''sign'')' (1977: 16; original emphasis). This claim was programmatic, but, albeit belatedly, it undoubtedly affected and enriched the thought of many who tried to adapt the methodology of structural linguistics as a model for that of the study of cultural signs in general, including such thinkers as Merleau-Ponty, Lévi-Strauss, Barthes and Lacan. So the impact of Saussure's work has to be measured not only in terms of its effects on the development of linguistics, especially European structural linguistics, but, more widely, in terms of its impact on the development of a methodology for the study of the social sciences in general.

Savigny, Friedrich Karl von (1779-1861)

*Friedrich Karl von Savigny was a powerfully influential student of Roman law both in its medieval manifestations and in the contemporary ‘*Pandektenrecht*’ (law based on Justinian’s Pandects, or Digest) of nineteenth-century Germany. His contributions to the philosophy of law are in the spirit of the Romantic movement, and lay stress on the organic character of the legal experience of a people, hence favouring customary law over statute law, and opposing the contemporary movement towards codification. A founder of what is sometimes called the ‘historical school’ in the philosophy of law, he argues that law is to be understood always in its historical setting, the result of a process of historical development, not simply as the arbitrary command of a - perhaps transitory - sovereign power.*

Savigny was a nobleman whose family roots were in Lorraine; his decision to become an academic was unusual for one of his class. His doctoral thesis of 1803, on ‘Possession’, made his reputation; analysing the civilian texts, he advanced the thesis that possession in law requires both physical control and an appropriate intention, namely the intention to hold the object in question for oneself. In 1810, he was called to his chair in Berlin, and taught there until 1842. Appointed then to be Prussian Minister for Legislation, he served until 1848. His two major scholarly works, the first on the *The History of the Roman Law during the Middle Ages*, the second on the *System of Modern Roman Law*, were published in the years 1815-21 and 1840-49 respectively. Especially in the analysis of personality in law, and in relation to contractual obligations, he had influence beyond the German-speaking world; at a time of revival in academic legal studies in England and America, his works had considerable influence in the common-law world.

His historicist view of law was most famously expressed in a pamphlet of 1814, *Zum Beruf unsrer Zeit für Gesetzgebung und Rechtswissenschaft (On the Vocation of our Age for Legislation and Jurisprudence)*. This was a polemic against a proposal by Thibaut for codification of law in the Germanic states along the lines of the already-celebrated Code Napoléon; as the German states emerged from their conquest and domination by Napoleonic France, Savigny issued his critique of the positivistic view implicit in the codification project. Law, he argued, emerges from the ‘spirit of the people’, the *Volksgeist*, and develops organically like language. As society becomes more advanced, there has to develop a special profession of lawyers, and it is their customs, including their practices of interpretation of received texts such as the *Pandects*, that express the people’s spirit so far as concerns technical law. As a protest against what F.A. Hayek was later to dub ‘constructivist rationalism’ in law, Savigny’s theory makes an important point; in awakening legal studies to the significance of history (and in founding a legal-historical journal that survives to this day), Savigny made an enduring contribution. His rather mysterious and holistic *Volksgeist* is, however, less convincing, and coloured by an unacceptable ethnic nationalism.

Scandinavia, philosophy in

The three countries of Scandinavia - Sweden, Denmark and Norway - share much of their history and culture with Finland and Iceland, and it is natural to treat all five Nordic countries together in any philosophical survey. The first universities in this region were founded more than 500 years ago, in Sweden at Uppsala in 1477, and in Copenhagen, the Danish capital, two years later. Over the years, the main trends of philosophical thought, from Descartes and Locke to Hegelianism, existentialism and logical positivism have all impinged upon philosophy in these countries. A unique feature of philosophy in Norway and Iceland, and until 1971 also in Denmark, is that all university students, including students in law, medicine and dentistry, spend all or most of their first semester preparing for a compulsory exam in philosophy which comprises some philosophy of science and philosophy of language, and some history of philosophy and history of science. This requirement has meant much for recruiting and employment opportunities for philosophers. Thus, for example, the University of Oslo has sixty-five tenured philosophers, while Denmark has suffered a dramatic reduction in the number of philosophical positions since the requirement was abolished. In Sweden philosophy is a compulsory subject in some branches of study in secondary schools.

That philosophers from the Nordic countries have gained a reputation for broad interests and familiarity with several philosophical traditions may largely be due to two factors: small countries *increase the likelihood that they will get involved in popularization and public affairs, and* small language communities *induce the learning of other languages, notably English, German and French, which makes developments in other countries more accessible.*

1 From the Middle Ages to *c.*1870

Philosophy in the Nordic countries began in the eleventh and twelfth centuries with the introduction of Christianity and the establishment of monasteries. Many went abroad to study at the leading universities, and some made notable contributions, such as the Swedish Averroist Boëthius of Dacia who, together with Siger of Brabant, taught at the University of Paris until they were both condemned in 1277. Boëthius ended his days in the 1290s as canon in Linköping.

When the first universities were set up in the late fifteenthth century, Aristotelianism continued to be the main philosophical pursuit. The University of Copenhagen, founded in 1479, almost perished during the Reformation and was re-established in 1537 as a Lutheran institution. The University of Uppsala was suppressed from 1515 to 1593. After the Reformation, a short period of interest in Ramism was followed by a rise in Cartesianism, due in no small way to the fact that in 1649 Descartes came to Stockholm as Queen Christina’s personal tutor. A widespread interest in natural law culminated with Samuel Pufendorf leaving his chair in Heidelberg in order to serve as Professor of Natural Law at the University of Lund during its first nine years. He thereafter went to Stockholm where he spent ten years writing a thirty-three-volume history of Sweden.

The mid-1700s were marked by the influence of Wolff, especially in Sweden and Finland. Subsequently, interest in Locke became prevalent in Finland and Sweden due to the work of Henrik Hassel (1700-76) and Henrik Gabriel Porthan (1739-1804) in Turku and Pehr Niclas Christiernin (1725-99) in Uppsala. Kant was introduced into Danish discussion by Børge Riisbrigh (1731-1809), and Kant’s ethics and philosophy of law had a strong influence on the lawyer and politician Anders Sandøe Ørsted (1778-1860) and through him on Danish law. In Sweden, Kant was introduced by Daniel Boëthius (1751-1810), while in Finland the poet and professor Franz Mikael Franzén (1772-1847) and others developed various versions of Kantianism. Kant had little impact in Norway, mainly as a consequence of the criticism of Niels Treschow (1751-1833), the first professor of philosophy at the new university of Oslo (founded 1813). Treschow, who developed a Spinozistic conception of evolution, was born in Norway and held a chair in Copenhagen from 1803 until taking up the appointment in Oslo. He left the university after just one year to go into government.

Schelling had some influence in Denmark, mostly due to Henrik Steffens (1773-1845). Born in Norway, Steffens studied in Copenhagen and went on to hold professorships in Halle, Breslau and Berlin. The dominant influence on philosophy in the Nordic countries in the late 1800s was, however, Hegel. In Uppsala, Benjamin Höijer (1767-1812) anticipated in interesting ways the post-Kantian developments of Fichte and Schelling. He is for this

reason often called ‘Sweden’s Fichte’. However, his later development was influenced by Hegel. The Uppsala professor of history Erik Gustaf Geijer (1783-1847), in opposition to Hegel, developed a personalistic philosophy, arguing that self-consciousness is possible only in interaction with other individuals: ‘No you - no I’. In Turku the philosopher and statesman Johan Vilhelm Snellmann (1806-81), who has been honoured as the ‘national philosopher’ of Finland, transformed Hegel’s idea of absolute spirit into a doctrine of national spirit expressed through a nation’s language and literature. Snellman gave philosophy a central public role in Finland, that it has retained since. In Denmark and Norway the influence of Hegel went so far as to become extremely oppressive, and Kierkegaard reacted strongly to Hegelianism and every other ‘system philosophy’. In Norway Hegelianism was introduced by the Danish philosopher and poet Poul Martin Møller (1794-1838), who taught philosophy at the University of Oslo from 1827 to 1831. However, it was through Marcus Jacob Monrad (1816-97), who became professor in Oslo at age 29 and retained the position for more than fifty years, that Hegelianism became more protracted in Norway than in any of the other Nordic countries. Following this period of widespread Hegelianism, philosophy developed in a different directions in each country.

2 Sweden

Christopher Jacob Boström (1797-1866), professor of practical philosophy in Uppsala from 1842 to 1863, developed a kind of personalism which combined elements of Plato’s theory of ideas, Leibniz’s monadology and Berkeley’s idealism (see Plato; Leibniz, G.W.; Berkeley, G.). Boström (who has been called ‘Sweden’s Plato’) exercized a strong influence on Swedish intellectual life in the latter part of the nineteenth century, acquiring a dominance similar to that of Hegel in the other Nordic countries. After Boström’s death, three of the four philosophy chairs in Sweden were held by his students: the chair of theoretical philosophy in Lund was held by a Hegelian.

The Uppsala school. In the first decade of the twentieth century the dominance of Boströminianism was broken by what was to become the most remarkable philosophical movement to come out of Sweden: the Uppsala school of philosophy, which flourished until the Second World War. This was the result of the work of two gifted philosophers, Axel Hägerström and his student and later colleague Adolf Phalén (1884-1931). In 1905 Hägerström started to develop the idea that was to become basic for the Uppsala school, that moral sentences express emotions and contain an imperative element. They may in addition have a descriptive ingredient, but their emotive component is the proper topic of ethics, which is an investigation into the noncognitive nature of moral sentences.

Hägerström expanded this view into philosophy of religion and philosophy of law. He rejected metaphysics and studied the ways in which language deceives us into thinking that there are values and that moral statements are true or false. While there are many similarities between the Uppsala school and later logical empiricism, there are also important differences: the Uppsala school combined moral subjectivism with epistemological objectivism, it rejected the view that the subject has immediate knowledge solely of its own experiences, and placed a strong emphasis on the history of philosophy. These historical studies were particularly important for Phalén. Whereas Hägerström maintained and supported his theses with great intensity, Phalén explored with calm objectivity the various possible ways in which the major philosophers have tried to deal with the contradictions in common-sense notions of time, motion, reality, knowledge and so on. This work started in 1910 with a criticism of subjectivism and continued in his large dissertation on Hegel two years later. Historical analysis is also evident in his works on space and time and other systematic issues, as well as in his lectures (unpublished until 1973-8). Phalén’s main interest, however, was epistemology, where his position resembles that of Husserl in some respects, and in 1911 he was the first philosopher in Scandinavia to write on Husserl’s phenomenology. After the Second World War, philosophy in Sweden became much more varied both in theme and perspective.

History of philosophy. The two most notable Swedish philosophers in the generation that succeeded the Uppsala School were Konrad Marc-Wogau (1902-91), professor of theoretical philosophy in Uppsala from 1946 to 1968, and Anders Wedberg (1913-78), professor of theoretical philosophy in Stockholm from 1949 to 1976. Marc-Wogau published a number of books and essays on Plato, Descartes, Marx, Hägerström and other figures in the history of philosophy and on contemporary Soviet thought. He also wrote a logic text and several studies of systematic issues, including a book on psychoanalysis. Together with his two prewar great books on Kant and his 1945 work *Die Theorie der Sinnesdaten* they establish him as one of Scandinavia’s most notable

philosopher-scholars. Wedberg's few, but high-quality publications, on a broad spectrum of topics, are mostly historical. He had a strong interest in Bolzano, which has been followed up by Jan Berg (1928-), since 1969 in Munich. Wedberg was above all a great systematic philosopher, and his works set a high standard for his students, the foremost of whom were Kanger, Berg and Prawitz.

In Lund, all the major philosophers during that period worked in the history of philosophy. Particularly important was Hans Larsson (1862-1944), professor of theoretical philosophy from 1901 to 1927, who wrote on Kant and Spinoza, and whose work earned him one of the eighteen places in the Swedish Academy. Åke Petzäll (1901-57) introduced logical empiricism in Sweden and founded the journal *Theoria*. His successor in the chair of practical philosophy, Manfred Moritz (1909-90) was Sweden's foremost expert on Kant's ethics after Hägerström. He also further developed Wesley Hohfeld's system of basic legal concepts, as did Kanger later.

Philosophical logic. The most prominent Swedish contributions to philosophy today are within the field of philosophical logic. Sören Halldén (1923-), who held the chair in theoretical philosophy in Lund from 1964 to 1988, produced the first major work in this field in Sweden in his Uppsala dissertation of 1950. His later contributions include one of the first studies of preference logic, several books on decision logic and its bearing on epistemology, and a number of other books and articles within several areas of philosophy. Together with the legal scholar Per Olof Ekelöf (1906-90) in Uppsala and the philosopher of science Martin Edman (1945-) in Umeå, Halldén has been working on the evaluation of evidence, particularly in courts, and developed the important notion of evidentiary mechanisms and the evidentiary value model.

A most significant Swedish contribution to philosophical logic was the dissertation which Stig Kanger (1924-88) wrote in Stockholm for Wedberg in 1957. Kanger here presented the key ideas of what has later come to be called 'Kripke semantics' for modal logic, named after Saul Kripke who published them in 1959 and 1963. Although Hintikka and Kripke discovered this type of semantics independently, it would be appropriate to call it Kanger-Kripke semantics. Kanger also made several further important and original contributions to logic and its applications and to the theory of measurement. He also developed and refined Hohfeld's system of basic legal terms. In 1968 he succeeded Marc-Wogau in the chair in theoretical philosophy in Uppsala.

Dag Prawitz (1936-) also wrote his dissertation with Wedberg and in 1976 succeded Wedberg in the chair of theoretical philosophy in Stockholm, after five years as a professor in Oslo. In his 1965 dissertation he was the first to prove Gentzen's *Hauptsatz* directly for certain systems of natural deduction. Prawitz has extended this result and has also written on causality, utilitarianism and a number of other topics, and has developed a Dummett-inspired theory of meaning. Similar work on meaning has been done by Per Martin-Löf (1942-), research professor in logic in Stockholm. Martin-Löf has also developed an intuitionistic-type theory and has done important work on the foundations of probability theory.

A main contributor to modal logic is Krister Segerberg (1936-), who in 1990 succeeded Kanger in Uppsala. Among his many results are a generalization of Lemmon and Scott's 'filtration method', a way of replacing complicated models with simple ones. Bengt Hansson (1943-), who succeeded Halldén in Lund in 1989, has worked in modal logic, preference logic, philosophy of science and philosophy of language. Among the many other philosophers in Sweden who have worked on logic and its applications, Per Lindström (1936-) in Gothenburg has done particularly important work in model theory. In 1969 he proved what has become known as Lindström's theorem.

Ethics. Among Swedish postwar philosophers, the best known to the general public has been Ingemar Hedenius (1908-82) who, from 1947 to 1974, held the chair once held by Hägerström. Hedenius' 1941 *Om rätt och moral (On law and morality)* exerted a strong influence on legal philosophy and ethics in Sweden, while his 1949 work *Tro och vetande (Faith and knowledge)* played an extraordinary role in the debate on religion in Scandinavia. Hedenius also developed a version of utilitarianism and wrote several articles and books on ethics and the history of ethics (Berkeley, Hume and Plato) as well as on other topics. His successor in Uppsala was Lars Bergström (1935-), who produced his dissertation under the direction of Ofstad and Wedberg in 1966. In 1987 he left Uppsala for Stockholm. Most of Bergström's work has been in ethics, much of it connected with his very precise statement of utilitarianism in his dissertation, but he has also written articles on other areas. In Lund, Göran Hermerén (1938-) has written on *Influence in Art and Literature* (1975) and other topics in aesthetics, is now professor of medical ethics.

Decision theory. Among Hedenius' and Bergström's many gifted students some have turned to decision theory and related fields. Sven Danielsson (1939-), who succeeded Bergström in Uppsala, and Wlodek Rabinowicz (1947-), professor of practical philosophy in Lund, have together with Peter Gärdenfors (1949-), professor of cognitive science in Lund, and Nils-Eric Sahlin (1954-) done important work on decision theory, group preferences and distributive justice. Gärdenfors and Sahlin have also worked on many other topics, including dynamic models of belief and empirical evidence.

Other activities. The fields that have been mentioned are particularly vigorous in Sweden, but there is also activity in many other fields. Gothenburg, in particular, has had two philosophers with highly distinctive profiles. Ivar Segelberg (1914-87), professor of philosophy from 1951 to 1979, wrote several phenomenological studies inspired by Phalén, and has in turn stimulated a third generation of Swedish phenomenolologists. Segelberg's successor, Mats Furberg (1933-) has written extensively on speech-act theory, and has in recent work attempted a reconciliation between speech-act theory and hermeneutics. However, his most distinctive contribution is a number of exceptionally engaging books in Swedish, on topics such as death, the meaning of life and the riddle of the world.

3 Denmark

Harald Höffding (1843-1931) was the dominant figure in Danish philosophy from the 1870s until he retired in 1915 after thirty-two years as professor in Copenhagen. His humanistic naturalism was inspired by, among others, the positivism of Comte and the empiricism of John Stuart Mill and Herbert Spencer. He defended a double-aspect theory of mind and body, and in a somewhat eclectic way, via utilitarianism and religion, he transposed ideas from the Danish idealist tradition into the framework of naturalism. Jørgen Jørgensen (1894-1969), professor in Copenhagen from 1926 to 1964, favoured Russell's logic and the logical positivist movement, and criticized 'metaphysical' assumptions in the sciences. In his later works Jørgensen developed a psychologistic understanding of epistemology and logic, and maintained that nerve processes, behaviour and ideas are different aspects of the same thing. In meta-ethics he defended an emotivist version of noncognitivism and in consequence a radical distinction between values and facts. A similar positivistic view on values was introduced in jurisprudence by Alf Ross, professor of law in Copenhagen from 1938 to 1969. Having studied under Hans Kelsen in Vienna, Ross adopted his tutor's interpretation of propositions in law as predictions of the behaviour of a judge in court.

Partly under Jørgensen's influence, several Danish philosophers have taken up philosophy of science, notably Johannes Witt-Hansen (1908-86), professor of philosophy in Copenhagen between 1959 and 1978, who wrote on Eddington, on matter, on generalization and on historical materialism. David Favrholdt (1931-), who in 1966 became the first professor of philosophy at the University of Odense, wrote his dissertation on Wittgenstein's *Tractatus*, but has been working on Niels Bohr. So has Jan Faye (1947-), who received his doctorate in Odense in 1981 with a dissertation in which he argued that backward causation is possible in principle. A major issue between Favrholdt and Faye is to what extent Harald Höffding had a decisive influence on Bohr's interpretation of quantum mechanics.

In ethics, a most influential Danish contribution has come from Knud Ejler Løgstrup (1905-81), professor of theology at the University of Aarhus. Inspired by the phenomenological philosophy of Hans Lipps, in the 1950s he developed an ethical theory which is widely studied in several countries, notably among theologians. Mogens Blegvad (1917-), professor of philosophy in Copenhagen from 1964 to 1987, has written on the naturalistic fallacy, action explanation and a variety of other topics.

The later Wittgenstein has influenced philosophy in Denmark mainly through Justus Hartnack (1912-), who dominated the philosophical scene in Aarhus during his time there as professor (1954-72). Peter Zinkernagel (1921-) argued that all language-use presupposes the truth of certain language rules embedded in ordinary language. These rules include substantial philosophical claims, for example that there is an external physical world. Thus phenomenalism and other traditional philosophical views which run counter to common sense turn out to be self-refuting.

The abolition of the compulsory philosophy exam in 1971, together with a negative attitude to universities among politicians, has been disastrous for Danish philosophy. In Copenhagen the number of chairs in philosophy was reduced from four to one. However, several young Danish philosophers went abroad to study and many of them

have returned, bringing with them a conception of philosophy as a discipline with fundamental systematic ambitions and introducing the works of Donald Davidson, Michael Dummett and Saul Kripke into Danish philosophy. Among these is Finn Collin (1949-), associate professor in Copenhagen who, after a dissertation on sensations in Berkeley, has written books on interpretive social science and on the construction of social fact. He has also written on causality and explanation, on phenomenology and hermeneutics, and on philosophy of language. His Copenhagen colleague Peter Sandøe (1955-), who studied in Frankfurt and Oxford, has written about moral realism.

History of philosophy. The most notable Danish contributions to philosophy in recent decades have come within the history of philosophy, most of them from Copenhagen, which is a centre for the study of ancient and medieval philosophy. Karsten Friis-Johansen (1930-) has followed his early important Plato studies with work on Democritus and on Kierkegaard, and has also written a monumental first volume of a four-volume history of philosophy. In the Classics Department, Johnny Christensen has written *An Essay on the Unity of Stoic Philosophy* (1962) and has produced several other works. In the theological faculty Troels Engberg-Pedersen (1948-) has written *Aristotle's Theory of Moral Insight* (1983) and *The Stoic Theory of Oikeiosis* (1990).

In medieval philosophy, Jan Pinborg (1937-1982) published a number of important studies on semantics and logic in the Middle Ages. Several of his articles were co-authored with Sten Ebbesen (1946-), whose main work is his three-volume *Commentators and Commentaries on Aristotle's Sophistici Elenchi* (1981). Niels Jørgen Green-Pedersen (1942-) has also written *The Tradition of the Topics in the Middle Ages* (1984).

In Aarhus, at the Institute for the History of Science, Olaf Pedersen (1920-) and his colleagues have produced a number of renowned studies on ancient and medieval history of science, mathematics and technology, among them Pedersen's *Early Physics and Astronomy* (1974) and his *Galileo and the Council of Trent* (1983).

Modern philosophy is studied in Copenhagen by Carl Henrik Koch (1938-), who has written the large third volume (from the Reformation to the Enlightenment) of a four-volume history of philosophy. Koch has also written a survey of eighteenth century philosophy for the *Cambridge History of 18th Century Philosophy*. Knud Haakonssen (1947-), who took his doctorate in Edinburgh on what later became the book *The Science of a Legislator. The Natural Jurisprudence of David Hume and Adam Smith* (1981), is now teaching at Boston University.

4 Finland

Like other countries, Finland experienced a reaction against Hegelianism towards the end of the nineteenth century, inspired in part by Höffding in Denmark. Particularly important was Edward Westermarck (1862-1939), whose work on ethical relativism reflects his combined interest in ethics and sociology. He divided his time between a chair of sociology in London and a professorship of philosophy in Helsinki, and later in Turku (Åbo). Westermarck and the aesthetician Yrjö Hirn (1870-1952) were the first Finns to influence international philosophical discussion.

In the 1930s, Eino Kaila (1890-1958) had an important influence on Finnish philosophy. He participated in the meetings of the Vienna Circle and wrote on the philosophy of psychology and the philosophy of physics (see Vienna Circle). He introduced symbolic logic and logical empiricism as well as Gestalt psychology and empirical psychology to Finland. Ultimately, however, he went more in the direction of philosophy of nature than philosophy of science. His students included Erik Stenius (1911-90), Oiva Ketonen (1913-) and Georg Henrik Von Wright, all of whom did some of their work in logic. Ketonen, who succeeded Kaila at the University of Helsinki in 1948 when Kaila was appointed to the Academy of Finland, has written influential works in Finnish on science policy and university affairs, as well as on general cultural issues. Stenius wrote his dissertation on paradoxes in logic and set theory. He later worked on the Presocratics, epistemology, logic and philosophy of language, but is best known for his incisive interpretation and defence of Wittgenstein's picture theory of language (1960).

Jaakko Hintikka (1929-) is, together with his teacher von Wright, among the leading figures on the international philosophical scene. Like so many Finnish philosophers, Hintikka came to philosophy from mathematics and did his first work in logic, developing further von Wright's idea of distributive normal forms, which continues to play a role in his later work. In 1957 Hintikka - independently of the slightly earlier proposal by Kanger and of the later one by Kripke - presented the basic idea of possible worlds semantics for modal logic. There is not room here to enumerate Hintikka's many important and seminal contributions to modal, epistemic and deontic logic, to model

theory, the interpretation of quantifiers, game theoretic semantics, to philosophy of science, epistemology and philosophy of language and to the history of philosophy from Plato and Aristotle, through the medievals, Descartes, Leibniz, Kant, and Husserl to Wittgenstein.

Hintikka has attracted a large number of talented students who, in the United States and in Finland, work in all the different areas of philosophy in which Hintikka has been working. His Finnish students are main contributors within all the three most active fields of philosophy in Finland today: philosophy of science, philosophy of language and the history of philosophy.

Philosophy of science. Two of Hintikka's earliest students teach at the University of Turku: Risto Hilpinen (1943-) and Juhani Pietarinen (1938-). Both wrote their dissertations on inductive logic. Hilpinen has also written on deontic logic, norms and imperatives and their connection with action theory, and on C.S. Peirce, in particular his theory of 'indeterminate reference'. Several of Hilpinen's latest publications explore a question-theoretic approach to scientific inquiry.

Raimo Tuomela (1940-) in 1970 was appointed to the newly established chair in the methodology of the social sciences in Helsinki, having received his Ph.D. at Stanford the previous year. He has worked mainly on action theory, particularly social action. Together with Ilkka Niiniluoto (1946-), he has written on theoretical concepts and hypothetico-deductive inference. Niiniluoto's later works, on scientific progress and especially truthlikeness, establish him as a leading philosopher of science. Niiniluoto has also contributed to inductive logic. He has published several studies on research policy and the evaluation of research, and has also branched into ethics and law, as in. In 1975 he became the first to hold a chair in the foundations of mathematics in Helsinki.

Jan von Plato (1951-) is working on the foundations of probability, particularly as applied in statistical physics and in dynamical systems. He has also written outstanding historical studies on the foundations of probability.

Philosophy of language. Hintikka's many ideas in the philosophy of language have been followed up by several of his students, in particular game-theoretic semantics, which has been applied to the study of quantifiers, partially ordered connectives, and anaphora. Hintikka-Åqvist's logic of questions has been applied to throw light on explanations.

History of philosophy. A characteristic of Finnish philosophy has been to combine historical and systematic work. Finnish systematic works are rich in historical references, and all the main Finnish historians of philosophy have made contributions to contemporary systematic discussion. Kaila had historical interests, but the combination of high-quality historical scholarship and systematic discussion starts with von Wright, Stenius and Hintikka. Greek philosophy has been studied by all three, especially Stenius and Hintikka. Important contributions have also come from Mårten Ringbom (1934-) and the classicists Rolf Westman (1927-) and Holger Thesleff (1924-). Simo Knuuttila (1946-) in the theological faculty in Helsinki has written on Greek philosophy, but his main work has been on medieval philosophy, to which he is one of the main contributors in Scandinavia. His 1976 dissertation showed that the assumptions concerning modality that Hintikka had attributed to Aristotle, were commonplace throughout most of the Middle Ages. Knuuttila has written on modality in *The Cambridge History of Later Medieval Philosophy* and has also produced numerous articles on subjects ranging from Plato to Descartes.

Finland also has a leading Descartes scholar, Lilli Alanen (1941-). As well as her books and articles on Descartes she is taking up systematic issues in the philosophy of mind and is directing a research group on intentionality. In 1997 she was appointed to a new chair in the history of philosophy at the University of Uppsala in Sweden. Another prominent woman philosopher in Finland is Leila Haaparanta (1954-), who has written a number of books and articles on Frege, Husserl, Peirce and other nineteenth-century thinkers.

Wittgenstein studies are particularly strong in Finland. In addition to the publications of Stenius, von Wright and Hintikka, important contributions have come from some of von Wright's and Stenius' students, notably Lars Hertzberg (1943-) and Heikko Kannisto (1945-). Two other philosophers who have been influenced by von Wright and Stenius are Ingmar Pörn (1935-) and Ghita Holmström-Hintikka (1936-). Pörn has written on action theory and social science, on deontic logic and also on power, Kierkegaard, the emotions and on health, health care and medical ethics, while Holmström-Hintikka has developed a theory of action and will, and applied it to the philosophy of law and in the analysis of medieval discussions, notably in Augustine and Ockham. She has also written on the philosophy of law and on medical ethics.

5 Norway

Monrad's long Hegelian reign was followed by a combination of philosophy and psychology, typical of the time. This combination culminated with Harald Schjelderup (1896-1974) who became professor of philosophy at age 26, but had his chair changed to psychology in 1928. From then until 1954 there remained only one professorship in philosophy in Norway. This was held from 1908 to 1937 by Anathon Aall (1867-1943), who was opposed to Hegelianism and combined empirical psychology, Greek philosophy and the history of Christian thought. Aall was succeeded in 1939 by Arne Næss (1912-), an appointment opposed by many who felt that empirical tendencies were a danger to philosophy. However, fortunately for the openness and the international orientation of Norwegian philosophy, Næss was appointed.

Although it is more than hundred years since philosophy became compulsory for all university students, there have been few teaching positions. In Oslo the situation has improved greatly during the last fifteen years. The philosophy department in Oslo now has sixty-five full-time permanent faculty members spread over most main areas of philosophy. The other universities are following suit. Areas of particular strength at present include logic, philosophy of science and the history of philosophy, notably Greek philosophy, Kant, Kierkegaard and Husserl. There is also an effort to build up pure and applied ethics and to attract more women to philosophy.

Logic and philosophy of language. The earliest international contributions to philosophy from Norway came in logic, starting with Axel Thue (1863-1922) and culminating with Thoralf Skolem (1887-1963). Oslo now has six professors of logic, three in the mathematics department and three in linguistics. Jens Erik Fenstad (1935-) has taught most of them.

In the Philosophy Department in Oslo, Dagfinn Føllesdal (1932-) started out as a student of Skolem, but went to Harvard to take a Ph.D. in philosophy with Quine, and now concentrates mainly on philosophy of language and phenomenology. Also in the Philosophy Department in Oslo is Andrew Jones (1947-), who is working in deontic logic and also in philosophy of mind, philosophy of language, artificial intelligence and particularly the philosophy of law. Jones has also been advisor to an impressive number of doctoral students. Olav Gjelsvik (1956-), also in Oslo, received his D.Phil. in Oxford 1986 and is working in the philosophy of mind, philosophy of language and action theory. In Trondheim Ingemund Gullvåg (1925-) has written on definiteness of intention, and in his later work has explored a wide variety of ideas in epistemology, metaphysics and philosophy of logic.

Philosophy of science. Philosophy of science, including philosophy of the humanities and the social sciences, is a main theme in the compulsory philosophy exam at the Norwegian universities. This has led to considerable activity within this field.

Jon Elster (1940-), based at Columbia University, has written an impressive number of widely read and highly regarded books on Marx and Leibniz, but mostly on issues relating to rationality and deviations from rationality, including addiction. He has also published empirical studies of justice. Nils Roll-Hansen (1938-), who combines philosophy of science with history of biology, has written on Pasteur, Wilhelm Johannsen and Lysenko, arguing from detailed analysis of historical case studies that there is a basis for objectivity and rationality in empirical science.

In Bergen, Gunnar Skirbekk (1937-) and Ragnar Fjelland (1947-) have established a centre for the study of the sciences and humanities. Fjelland, who came from engineering to philosophy, is working on philosophical issues connected with science and technology, while Skirbekk has written several books in French, English and German, on political philosophy, rationality and other topics. Together with Nils Gilje (1947-) he has written a history of philosophy, which has been translated into several languages. Erik Brown (1943-) in Bergen and Magne Dybvig (1940-) and Sverre Sløgedal (1930-) in Trondheim are working in epistemology, while Audun Øfsti (1938-) in Trondheim and several of the philosophers in Troms, the world's northernmost university, are working in transcendental pragmatics.

Greek philosophy. The study of Greek philosophy in Norway is concentrated in Oslo, which has a special chair. Egil Wyller (1925-), who has written on Plato's Parmenides and worked out a Plato-inspired philosophy of unity called 'henology', has been succeeded in this chair by Eyjólfur Kjalar Emilsson (1943-), a native of Iceland. Emilsson, whose main work has been on Plotinus, now has two younger colleagues who, like himself, each

received their Ph.D. in Greek philosophy from Princeton.

Kant. Several philosophers are working on Kant and German transcendental philosophy, among them two women in Oslo, Hjørdis Nerheim (1940-) - Norway's only woman professor in philosophy - and Camilla Serck-Hanssen (1960-), who has her Ph.D. from the University of California, San Diego. She worked there with Henry Allison (1937-), who since 1995 has been Professor at the University of Oslo.

Kierkegaard studies. Alastair Hannay (1932-) came to Oslo from London in 1961. He served as professor in Trondheim from 1975 to 1985 before returning to Oslo, where he was appointed professor in 1990. He has written extensively on Kierkegaard and has translated several of Kierkegaard's works into English. He has also written on the philosophy of mind, and since 1971 has been editor of the journal *Inquiry*, which was founded by Arne Næss in 1958.

Husserl's phenomenology. In Norway, the study of phenomenology started in Oslo in the 1950s and then spread to the other universities. In 1956 Dagfinn Føllesdal wrote his M.A. thesis on Husserl and Frege, and the following year Hans Skjervheim (1926-) wrote his on 'Objectivism and the study of man'. Skjervheim, who was professor in Bergen from 1982 until he retired, criticized various tendencies to 'objectivize' mental and social phenomena and not recognize their intentionality. Skjervheim has been important for an anti-positivist movement in Norway. There are now several young philosophers in Norway, chiefly in Oslo, working in phenomenology and related fields.

Wittgenstein. Wittgenstein had his hut in Skjolden, one of the inner branches of the Sogne Fjord north of Bergen. Appropriately, the University of Bergen has taken the responsibility for The Norwegian Wittgenstein Project, whose aim is to register Wittgenstein's *Nachlaß* in electronic form.

Ethics. Ethics is an area of rising activity, and the central figure here has been Knut Erik Tranøy (1918-), professor in Bergen from 1959 to 1978, and in Oslo from 1978 to 1986. Tranøy was the first professor of medical ethics in Oslo (1986-8). In 1989 a centre for medical ethics was founded in Oslo on Tranøy's initiative. Tranøy has written on ethics, on science as a norm-guided activity, on Aquinas and on Wittgenstein. Also Tore Nordenstam (1934-) in Bergen has written extensively on ethics and also on aesthetics, as has Kjell S. Johannesen (1936-). In Oslo, Jon Wetlesen (1940-) has been a main contributor to ethics.

To build up more competence in ethics in Norway, the Norwegian Research Council started a ten-year ethics programme in 1991, which has thirty people working towards doctorates in ethics. Most concentrate on applied ethics and already have a doctorate or similar background in the field whose ethics they are studying.

There is also an effort to bring more women into philosophy. In addition to those mentioned above, there is Vigdis Songe-Møller (1949-) in Bergen, who has written on Parmenides and on women's issues. Also Else Viestad (1940-) is working on women's issues, as well as Else Barth (1928-), professor emeritus of analytic philosophy in Groningen.

6 Iceland

Iceland, with a population of merely 266,000, has two universities: the University of Iceland in the capital, Reykjavik, founded in 1911, and a small university in Akureyri in the north, established in 1987. At both universities the compulsory 'philosophicum' is taught. This has led to there now being five professorships in philosophy in Reykjavik and several lectureships there and in Akureyri. Since its beginning, Icelandic philosophy has been internationally oriented, and Icelandic philosophers have usually gone abroad for their doctorates. However, after their return to Iceland much of their effort has gone into making classical and contemporary philosophy accessible to Icelanders through translation and popular publications, and they have published relatively little for an international public. They have been working in all the central areas of philosophy, and also in the history of philosophy, on Plotinus, Descartes, Hume, Nietzsche, Husserl, Heidegger, Ingarden and Ricoeur.

Scepticism

Simply put, scepticism is the view that we fail to know anything. More generally, the term 'scepticism' refers to a family of views, each of which denies that some term of positive epistemic appraisal applies to our beliefs. Thus, sceptical doctrines might hold that none of our beliefs is certain, that none of our beliefs is justified, that none of our beliefs is reasonable, that none of our beliefs is more reasonable than its denial, and so on. Sceptical doctrines can also vary with respect to the kind of belief they target. Scepticism can be restricted to beliefs produced in certain ways: for example, scepticism concerning beliefs based on memory, on inductive reasoning or even on any reasoning whatsoever. And sceptical views can be restricted to beliefs about certain subjects: for example, scepticism concerning beliefs about the external world, beliefs about other minds, beliefs about value and so on. Solipsism - the view that all that exists is the self and its states - can be seen as a form of scepticism based on the claim that there are no convincing arguments for the existence of anything beyond the self.

The philosophical problem of scepticism derives from what appear to be very strong arguments for sceptical conclusions. Since most philosophers are unwilling to accept those conclusions, there is a problem concerning how to respond to the arguments. For example, one kind of sceptical argument attempts to show that we have no knowledge of the world around us. The argument hinges on the claim that we are not in a position to rule out the possibility that we are brains-in-a-vat being artificially stimulated to have just the sensory experience we are actually having. We have no basis for ruling out this possibility since if it were actual, our experience would not change in any way. The sceptic then claims that if we cannot rule out the possibility that we are brains-in-a-vat, then we cannot know anything about the world around us.

Responses to this argument often fall into one of two categories. Some philosophers argue that we can rule out the possibility that we are brains-in-a-vat. Others argue that we do not need to be able to rule out this possibility in order to have knowledge of the world around us.

1 The philosophical problem of scepticism

Most contemporary discussions of scepticism have focused on scepticism concerning the external world. We can use this type of scepticism to illustrate the broader philosophical problem, as many of the arguments we consider can be applied *mutatis mutandis* to other types of scepticism.

One type of scepticism denies that we know anything about the external world. The view is not simply that, for example, by gathering more evidence we could come to know. Rather, it is that we are unable to attain knowledge. On the plausible assumption that knowledge entails justified belief, scepticism concerning knowledge follows from scepticism concerning justified belief - the view that justified belief about the external world is unattainable.

Scepticism is of philosophical interest because there appear to be very strong arguments that support it. This presents us with the problem of how to respond to these arguments. One way would be to accept their conclusion. Of course, very few philosophers are willing to do this. There are very few actual sceptics. So the problem of scepticism is how to refute or in some way neutralize or deflate the force of these arguments.

In the history of philosophy, some sceptical arguments have been based on the unreliability or relativity of our senses (see Pyrrhonism), or upon the inability of reason to produce non-question begging arguments for our beliefs (see Hume, D. §2). Nearly all sceptical arguments exploit sceptical hypotheses or alternatives. Sceptical alternatives suppose that the world is very different from what we would normally believe on the basis of our sensory evidence. This entails that our sensory evidence is radically misleading. More precisely, suppose we claim to know a proposition q on the basis of evidence e. Let (proposition) h be an *alternative* to q just in case h is incompatible with q (q and h cannot both be true). Then h is a *sceptical alternative* to q provided h is an alternative to q compatible with e. An alternative of this kind has sceptical force precisely because it is compatible with the evidence we claim gives us knowledge of q. For example, ordinarily, I would claim to know on the basis of my visual evidence that I am currently looking at my computer monitor. One sceptical alternative, introduced by Descartes (1641), is that the world of familiar objects does not exist and that I am being deceived into thinking it does by a powerful demon. The demon causes me to have just the sensory experiences I would have if the world of familiar objects existed (see Descartes, R. §4). According to a modern version of this alternative, I am a

brain-in-a-vat being artificially stimulated to have all the experiences I would have if I had a body and interacted, in the normal way, with the world of familiar objects. These alternatives are incompatible with what I claim to know about the familiar world around me since according to those alternatives, that world does not exist. Moreover, since these alternatives entail that it appears to me as if that world exists, they are compatible with my evidence.

Sceptical alternatives provide the basis for very powerful sceptical arguments. Exactly how they do this is a matter of some controversy. The quickest route to scepticism is through what I will call the entailment principle:

S knows *q* on the basis of (evidence) *e* only if *e* entails *q*

Since a sceptical alternative is, by definition, a proposition incompatible with *q* but compatible with *e*, it follows from the mere existence of sceptical alternatives of the kind we have been considering that we do not know those empirical propositions we ordinarily claim to know. But, this argument is only as good as the entailment principle. Should we accept this principle? In effect, the principle says I can know *p* only if my evidence precludes the possibility of error. Though many philosophers concede that this principle has considerable intuitive force, most have thought, in the end, that it should be rejected. This position is sometimes called fallibilism (see Commonsensism §§1-2; Fallibilism). Of course, few philosophers believe that scepticism should be avoided at all costs. But when given a choice between scepticism and fallibilism, most philosophers opt for fallibilism (at the expense of the entailment principle).

Does fallibilism beg the question against scepticism? After all, precisely what the sceptic claims is that the existence of alternatives consistent with our evidence undermines our claims to know. Fallibilists merely respond that the alternatives the sceptic has invoked do not undermine our knowledge claims: that is, we can know even when there are such alternatives. Since this is the point at issue, fallibilists seem to need an argument in support of this crucial claim.

Here, fallibilists can appeal to our strong intuition that in many cases we do know things, despite the existence of sceptical alternatives. And it is not clear that the sceptic can undermine those intuitions except by appealing to the entailment principle - which is itself undermined by those very intuitions. Thus neither side of the debate may be able to defend its position without begging the question.

Unfortunately scepticism is not so easily dispatched. The sceptic can turn the appeal to our ordinary intuitions against fallibilism. For some of those intuitions can provide the basis for a new sceptical argument. This argument begins by claiming, quite plausibly, that whatever else we may say about the significance of sceptical alternatives, we cannot claim, plausibly, to know they are false. For example, we cannot claim, plausibly, to know that we are not brains-in-a-vat being artificially stimulated to have exactly the same experience we would have as normal human beings. None of our evidence counts against this hypothesis since if it were true, we would have precisely that evidence.

But how, exactly, does this permit the sceptic to conclude we do not know the propositions we ordinarily claim to know? At this point, the sceptic appeals to a very intuitive principle that is weaker than the entailment principle. This principle says that the set of known (by *S*) propositions is closed under known (by *S*) entailment:

If *S* knows *q*, and *S* knows that *q* entails not-*h*, then *S* knows not-*h*

While one could quibble with some details about this principle, it (or something very much like it) seems compelling (see Deductive closure principle). From this principle and the claim that we fail to know sceptical alternatives are false, it follows that we fail to know the propositions we ordinarily claim to know (since we know those propositions entail the falsity of sceptical alternatives).

2 Responses to scepticism

This argument presents problems for fallibilism, as I have characterized it, since the argument at no point presupposes the entailment principle. The sceptical argument we are now considering merely exploits the fallibilist position that permits the existence of alternatives to known propositions.

Fallibilist responses come in two forms, each of which corresponds to the denial of one of the two premises of the

sceptical argument. One response denies the closure principle. For example, Dretske (1970) has argued that the fact that we do not know the falsity of sceptical alternatives shows that the closure principle is false, since we do know the truth of many empirical propositions that (we know) entail the falsity of sceptical alternatives. According to this view, certain alternatives are not relevant to whether one knows a proposition: one does not have to know such an alternative to *q* is false in order to know *q*. So, for example, one can know that one sees a zebra without knowing that the alternative - that one sees a cleverly disguised mule - is false, because that alternative is not relevant. This version of fallibilism is sometimes called the 'relevant alternatives' view.

The other fallibilist response to the sceptical argument agrees with the sceptic that the closure principal is true. But, against the sceptic, these fallibilists deny the claim that we fail to know the falsity of sceptical alternatives. One version of this fallibilist response uses the closure principle along with the claim that we do have knowledge, to reject the claim that we do not know that sceptical alternatives are false. They argue from the premise that we know some ordinary proposition *q* and the premise that if we know *q* then we know any proposition that we know is entailed by *q* (the closure principle), to the conclusion that we know that we are not seeing a cleverly disguised mule. We can call this view '*modus ponens* fallibilism'.

3 Relevant alternatives fallibilism

As we have noted, the sceptic attempts to undermine our claims to know by calling attention to sceptical alternatives. The relevant alternatives response to this sceptical manoeuvre is to deny that these alternatives are relevant. An alternative, *h*, to *q*, is relevant just in case we need to know *h* is false in order to know *q*. So if *h* is not a relevant alternative, we can still know *q* even if we fail to know *h* is false. This view entails that the deductive closure principle is false.

There are two ways to argue for this view. The direct way is to cite alleged counterexamples to the deductive closure principle. Some philosophers have done this by appealing both to our intuition that we know many propositions about the external world and to our intuition that we fail to know the falsity of sceptical alternatives. So my strong intuition that I know I am looking at my computer monitor and my strong intuition that I fail to know I am not a brain-in-a-vat constitute the basis for such a counterexample.

A more indirect way to argue for this view is to construct a theory of knowledge that has as a consequence, the failure of the closure principle, as in Nozick (1981). The basic idea of these kinds of theories is that knowing requires the truth of certain subjunctive conditionals. On one (simplified) version, my knowing *q* requires that:

(S) If *q* were false, I would not believe *q*

This requirement for knowledge precludes my knowing I am not a brain-in-a-vat. For I would still believe I am not a brain-in-a-vat, even if I were a brain-in-a-vat. But, this requirement allows me to know I see a computer monitor. For it seems plausible to claim that I would not believe I see the computer monitor if I were not seeing it.

A significant difficulty for the direct way of arguing for the relevant alternatives view - the appeal to counterexamples to the closure principle - is that the intuitions that support the counterexamples seem no more compelling than the intuitions in favour of the closure principle. Many think that the closure principle expresses a fundamental truth about our concept of knowledge. So much so that if a certain theory of knowledge entails the falsity of the closure principle, some philosophers are inclined to take the fact as a *reductio ad absurdum* of that theory.

But this presents problems for the indirect way of arguing for the relevant alternatives view: some philosophers reject theories that endorse condition (S), for the very reason that it entails the falsity of the closure principle. Moreover, there are other difficulties for theories that endorse conditions like (S). One problem for these theories is that they seem to preclude our knowing much of what we take ourselves to know inductively. Consider an example where you leave a glass containing some ice cubes outside on an extremely hot day (Vogel 1987). Several hours later, while you are still inside escaping the heat, you remember the glass you left outside. You infer that the ice must have melted by now. Here we have an ordinary case of knowledge by inductive inference. According to the theories we are now considering, my knowing that the ice cubes have melted requires the truth of this subjunctive conditional:

(S′) If the ice cubes had not melted, I would not believe that they had

But (S′) looks false. It seems plausible to claim that had the ice cubes not melted, it might have been for some reason (for example, someone putting them in a styrofoam cooler) that would still leave me believing they had melted. Thus, it looks as if theories which endorse this condition are too strong. If this is correct, then the anti-sceptical results afforded by condition (S) come at the cost of scepticism about certain kinds of inductive knowledge.

We should note, however, that there is some controversy over the evaluation of subjunctive conditionals like (S′). But I think it is fair to say that standard semantics for subjunctive conditionals would render (S′) as false (see Deductive closure principle §§2-3).

4 *Modus ponens* fallibilism

Modus ponens fallibilists accept, along with the sceptic, the deductive closure principle. But they attempt to turn that principle against the sceptic. Like relevant alternatives fallibilists, they take as a starting point the strongly intuitive claim that we do know many things about the world. They then note that, given the closure principle, it follows that we know the falsity of sceptical alternatives. For example, I now know that I am looking at my computer monitor. I also know that my looking at a computer monitor precludes my being a brain-in-a-vat. It follows by the closure principle that I know I am not a brain-in-a-vat.

Is this piece of reasoning legitimate? One might challenge those who reason in this way to explain how we know sceptical alternatives are false. How, for example, do I know I am not a brain-in-a-vat? After all, the sceptical problem arises because we seem to lack any reason for believing sceptical alternatives are false. These alternatives are constructed so as to make it impossible for our evidence to count against them. Presumably, our recognition of this explains, at least in part, our intuition that we fail to know sceptical alternatives are false.

One way for the *modus ponens* fallibilist to try to meet this challenge is to claim that I can know:

not-*h*: I am not a brain-in-a-vat

by inferring it from:

q: I am looking at my computer monitor

According to this way of proceeding, even though none of my evidence for *q* counts in favour of not-*h*, it does not follow that I have no reason to believe not-*h*. For that reason can be *q* itself. Since I know *q* (on the basis of my visual evidence) and I know that *q* entails not-*h*, I can infer not-*h* from q and thereby come to know not-*h*.

Is this reasoning legitimate? Let’s compare it with another case. Suppose I park my car in front of the market and go inside. Although I am not currently looking out the window I can still know:

p: My car is parked in front of the store

Can I then come to know:

r: My car has not been towed away

simply by inferring it from *p*? Notice that *p* entails *r*. It seems, none the less, that I would already need to have sufficient evidence to know *r* before I could infer *p*. And if my initial evidence is insufficient for me to know *r*, I cannot infer *p* and so I cannot infer *r* from *p*.

The *modus ponens* fallibilist reasoning concerning sceptical alternatives looks suspicious because it seems like the reasoning in the parked car case. Intuitively, I need to have reason to believe not-*h* before I can infer (and thereby come to know) *q*. Thus I cannot first infer *q* and then go on to infer (and thereby come to know) non-*h*.

Another version of fallibilism argues for the claim that we know sceptical alternatives are false by appealing to principles of inductive inference. One version of this view argues that the hypothesis that the familiar world of objects exists is the best explanation of our sensory evidence (and so a better explanation than sceptical

alternatives). This licenses an inference from our sensory evidence to the familiar-world hypothesis (see Inference to the best explanation). We can thereby come to know that this familiar world exists. And since we know that the familiar-world hypothesis rules out the sceptical alternatives, it follows by the closure principle that we know sceptical alternatives are false.

The burden for this view is to say why the familiar-world hypothesis is a better explanation of our sensory evidence than any sceptical alternative. This is not easy to do since sceptical alternatives are designed to explain our sensory evidence. Proponents of the view that sceptical alternatives provide inferior explanations often appeal to pragmatic considerations like simplicity and conservatism. But there are several problems with this approach. Even if we could establish that the familiar-world hypothesis is, for example, simpler than any sceptical alternative, why should we think that this supports the claim that the hypothesis is true? Unless this crucial link can be made, it is not clear how this response to the sceptic can succeed (see Theoretical (epistemic) virtues).

Moreover, often arguments that the familiar-world hypothesis is the best explanation of our sensory data are quite sophisticated and complex. This raises the worry that only those who are philosophically sophisticated enough to follow such an argument can have knowledge of the external world.

5 The role of intuitions

Many fallibilist responses to the sceptic take as their starting point our ordinary intuitions about knowledge or our everyday pattern of knowledge attributions. But how exactly can our everyday pattern of knowledge attributions have force against sceptical arguments, since the sceptic is calling into question precisely these attributions?

The reason our ordinary intuitions about knowledge have force against the sceptic is that these intuitions persist even in the face of sceptical arguments. When we confront a sceptical argument, even though we may not be able to say where the argument goes wrong, we are reluctant to withdraw our everyday knowledge attributions. This is the basis of G.E. Moore’s famous response to sceptical arguments. Moore claimed to be more sure that he knew some things, for example, that he has a hand, than he is that the sceptical argument is sound. So even though he could not say where the sceptical argument goes wrong, he thought it more rational to suppose that there is a mistake in the sceptical argument than to suppose that the conclusion of the argument - we fail to know anything - is true (see Moore, G.E. §3; Commonsensism).

The sceptic could try to dismiss the significance of our reluctance to withdraw our everyday knowledge attributions as nothing more than the persistence of old habits. This persistence of our habitual ways of thinking about knowledge even after we have been confronted with sceptical arguments was noticed by Descartes and by Hume.

But in response, we can note that, often, we find our everyday pattern of knowledge attributions compelling even while we are in the midst of sincere philosophical reflection. The fact is that when we think about sceptical arguments, we often find ourselves pulled in two directions. We feel the pull of the sceptical argument and yet we remain reluctant to give up our claims to know. This phenomenon cannot be dismissed as nothing more than an unreflective habit. So the fallibilist can maintain that our everyday knowledge attributions reflect deep-seated intuitions about our concept of knowledge. Since our intuitions are a kind of data that any theory of knowledge must explain, they present a formidable challenge to the sceptical position.

Nevertheless, there is something unsatisfying about rejecting scepticism just because it conflicts with our intuitions about knowledge. For, again, it is hard to deny the force of the sceptical argument. And just as our intuitions about our everyday knowledge attributions present a problem for scepticism, so our sceptical intuitions present a challenge to our everyday knowledge attributions. If scepticism is a strongly counterintuitive view, then why do sceptical arguments have any grip on us at all? Why do we not immediately respond to sceptical arguments by objecting, for example, that sceptical hypotheses are too remote and fanciful to undermine our knowledge claims? (Either we can know that sceptical alternatives are false or we need not know they are false in order to know things about the external world.) Sometimes we are inclined to do just that. But the sceptical problem arises precisely because we cannot always sustain that attitude. Sometimes, when we consider sceptical arguments, we begin to worry that sceptical alternatives really do threaten our knowledge claims.

What we are confronting here is a paradox - a set of inconsistent propositions, each of which has considerable

independent plausibility:

(1) We know some ordinary empirical propositions.
(2) We do not know that sceptical alternatives are false.
(3) If *S* knows *q*, and *S* knows that *q* entails not-*h*, then *S* knows not-*h*.

One of these propositions must be false (on the assumption that we know *q* entails not-*h*). Yet each of them is very difficult to deny. This is what explains our vacillation over scepticism. The arguments for scepticism and for fallibilism attempt to exploit the intuitions favourable to them. The sceptic appeals to (2) and (3), and concludes that (1) is false. Relevant alternatives fallibilism appeals to (1) and (2), and concludes that (3) is false. *Modus ponens* fallibilism appeals to (1) and (3), and concludes that (2) is false. Because each member of the set has independent plausibility, it seems arbitrary and unsatisfying to appeal to any two members of this triad as an argument against the third. Such a strategy does not provide what any successful resolution of a paradox should provide, namely an explanation of how the paradox arises in the first place. Any satisfying resolution of the paradox that defends our claims to know against the sceptic must explain the appeal of sceptical arguments. For it is that very appeal that gives rise to the paradox.

This is where Moore's response to the sceptic goes wrong. Many philosophers think that Moore begged the question against scepticism. In a way he did, but no more so than the sceptic begs the question against him. Still, there is something quite unsatisfying, philosophically, about Moore's treatment of the sceptical argument. But the problem with it is not that it begs the question against the sceptic. Rather the problem is that it fails to explain the dialectic force of sceptical arguments. Though it is possible that the apparent cogency of sceptical arguments is explained by some very subtle error in our reasoning, the simplicity of these arguments suggests that their appeal reveals something deep and important about our concept of knowledge. That is why we can learn much about the nature of knowledge by grappling with the problem of scepticism.

Scepticism, Renaissance

Ancient Greek scepticism was revived during the Renaissance, and played an important role in the religious and philosophical controversies of the time. There is little evidence that ancient scepticism was known directly during the Middle Ages, or that its perplexing questions played any significant role in medieval thought. It was indirectly known from the writings of Augustine; some manuscripts of the texts of Cicero and Sextus Empiricus were available; and occasionally vague reference to some sceptical details appears in medieval discussions. However, the interests of scholastic philosophers were, by and large, far removed from the questions about the sources, reliability and certainty of knowledge claims that concerned the ancient sceptics. With the humanistic revival of interest in ancient literature there came a rediscovery of scepticism as presented in the writings of Cicero, Sextus Empiricus and Diogenes Laertius. Cicero's Academics (Academica) was read from the fourteenth century on; Life of Pyrrho by Diogenes Laertius was rediscovered in the early fifteenth century; and Greek manuscripts of the writings of Sextus were brought from Constantinople into Italy in the mid-fifteenth century. These treasuries of sceptical argumentation were used in many ways in the Renaissance. At first they were seen largely as sources of information about the ancient world, but gradually more attention was paid to the actual arguments they contained. Some saw these arguments as a basis for rejecting Aristotelian philosophy, as well as other ancient dogmatic claims about nature and humanity. Others used them as ammunition in the great religious controversies between Catholics and Protestants. A full-fledged scepticism about knowledge claims was developed in the second part of the sixteenth century, through the work of Sanches and Montaigne. Montaigne was particularly inspired by the first published Latin translations of the writings of Sextus Empiricus. Scepticism in all its forms was closely associated with fideism. If it is impossible to acquire knowledge of anything through the senses and reason, then it is impossible to acquire knowledge of God in these ways, and one can argue that religious truth must be accepted on the basis of faith in divine revelation. The weak recommendation of ancient sceptics to suspend belief while accepting local customs as the guide for conduct was thus turned into a strong recommendation to adopt Christian beliefs. Only later did epistemological scepticism become associated with scepticism about religious beliefs themselves. Renaissance scepticism in its various guises was a major intellectual force in the transition from scholasticism to modern thought.

1 Recovery of ancient texts

The most important direct sources of ancient scepticism are Cicero's philosophical dialogue, *Academics (Academica)*, written in Latin (see Cicero §3); *Outlines of Pyrrhonism* and *Against the Professors (Adversus Mathematicos)* by Sextus Empiricus, both written in Greek; and the *Life of Pyrrho* which Diogenes Laertius, included in his *Lives of the Philosophers*, also written in Greek. Through these works Renaissance authors became acquainted with two types of scepticism, both of which employed arguments and dialectical puzzles to cast doubt on sense perception and reason as sources of knowledge and on the possibility of formulating any reliable criterion for judging knowledge claims. Academic sceptics (whose views were formulated from the third to the first century BC), at least as interpreted during the Renaissance, were those who denied the possibility of any knowledge, thus adopting negative dogmatism. They were also said to have allowed probable judgments, a stance criticized by Montaigne (§3) who said 'Either we can judge absolutely, or we absolutely cannot.' Pyrrhonian sceptics, who were followers of Pyrrho, preferred to say that judgment should be suspended altogether. This epistemological stance had moral implications, for the sceptic was then exhorted to live peacefully in accordance with the laws and customs of society.

During the Middle Ages, scepticism was known only indirectly through Augustine's attack on Academic scepticism in his *Contra Academicos* and *De Trinitate* (see Augustine §2). The *Life of Pyrrho* was not available at all, and while there are some medieval manuscripts of Cicero's *Academics* and some early fourteenth-century manuscripts of a partial Latin translation of *Outlines of Pyrrhonism* by Sextus Empiricus, there is no evidence that anyone made use of this material. Only in fourteenth-century Byzantium was there any interest in ancient scepticism. Nor was there any independent development of scepticism. Neoplatonic doubts about sense perception as a basis for knowledge, various types of mysticism, and fourteenth-century discussions both of intuitive cognition and of God's absolute power certainly allowed opportunity for such development, but the opportunity was not taken. The main factor in the revival of scepticism was the recovery of the ancient texts.

These texts first became known in Italy through the work of the humanists, though after the 1520s the focus of attention shifted to northern Europe. Cicero’s *Academics* was the first to be read, though it never became very popular. While it had been available before the fourteenth century, it became better known after Petrarch (see Petrarca, F.) referred to it. It was printed with the other works of Cicero in 1471, but the first separate printed text only dates from 1535 and the first commentary from 1536. Diogenes Laertius’ *Lives of the Philosophers* (including the *Life of Pyrrho*) was widely known and studied from the early fifteenth century in Latin and Italian translations, and the first Greek text was printed in 1533. It was used to supplement the information available from Latin sources.

The most important ancient source is Sextus Empiricus. His work was almost unknown until the mid-fifteenth century, when manuscripts from Constantinople began to circulate in Italy. By the end of the century Greek manuscripts were available in Rome, Venice and Florence, especially in the library of the convent of San Marco where Girolamo Savonarola was the prior. At first, Sextus Empiricus seems to have been regarded as a literary, philological and historical source, rather than as a source of epistemological problems. Serious philosophical attention was paid to him in northern Europe after the publication of two Latin translations. His *Outlines of Pyrrhonism* was published by the Protestant Henri Estienne in 1562, and his *Against the Professors* was published (along with Estienne’s translation of *Outlines of Pyrrhonism*) in 1569 by the Catholic Counter-Reformer Gentian Hervet. The Greek texts were not printed until 1621.

The term ‘sceptic’ itself comes from the recovery of the ancient texts, for *scepticus* and its Latin cognates became an accepted part of the intellectual lexicon only during the fifteenth century.

2 Informal sceptical currents

Many developments in the Renaissance raised problems and questions about accepted beliefs, and gave rise to an informal scepticism about previous knowledge claims in many areas. One important factor was the European discovery of America and the first voyages round Africa to India, China and Japan which led to the discovery of new cultures, civilizations and religions all over the planet. Information brought back by the explorers and later by Jesuit missionaries, raised doubts about all previous claims about geography, and even about the nature of the human being. Could one still accept the biblical view about human origins? Where did all these different people come from? Were they truly human? Attempts were made to fit everybody into the biblical framework by referring to possible migrations after the Flood and after the Tower of Babel episode. But could this really account for how people crossed wide oceans, and had such different ways of living? Some hardy souls suggested that the American Indians were, perhaps, pre-Adamites, peoples who had an independent origin. If this were the case then the Bible could no longer be considered the complete history of humanity. Thomas Harriot, who accompanied Sir Walter Ralegh to Virginia, is supposed to have presented an ‘atheist’ lecture on his return in which he said that American Indian history was 16,000 years old, while biblical history was supposed to have started only in 4004 BC. Giordano Bruno suggested that there were three original protoplasts from which three different kinds of human being developed. In the seventeenth century, Isaac La Peyrère (1596?-1676) in his book *Prae-Adamitae* (1655) offered the hypothesis that there were humans before Adam who were not created by God, but were part of an eternal universe. Only Adam was divinely created as a way of starting divine history, the history of the Jews, but not the rest of humanity.

Another source of informal scepticism was the influence of humanism on Bible scholarship. The increased use of Greek and Hebrew raised serious sceptical questions as to whether the biblical text is correct, complete and accurate. Erasmus questioned whether the doctrine of the Trinity was really in the original version of the New Testament. Others, especially those using Jewish materials, questioned the accepted Christian readings of the text. Some, like Michael Servetus, who was burned at the stake in 1553 by John Calvin and his followers, even suggested that the Bible had to be understood contextually, in terms of what was going on in ancient pre-Christian times, rather than in terms of foreshadowings of the New Testament. Scholars began questioning the authenticity of some of the canonic writings and the status of the Apocrypha (see Humanism, Renaissance §6).

Along with the growing knowledge of Hebrew during the Renaissance came the awareness of a wholly different way of understanding Scripture and the cosmos, namely that presented in the Jewish Kabbalistic writings. The Kabbalah was a series of medieval Jewish treatises containing Neoplatonic and Gnostic elements (see Kabbalah). The treatises purported to contain an ancient wisdom and to offer non-rational ways of understanding the world.

Many thinkers combined the study of the Kabbalah with the study of the *Corpus Hermeticum*, a body of writings from the second and third centuries AD (see Hermetism). These too contained a mixture of Neoplatonic, Gnostic, Jewish and other elements, and they purported to record a wisdom which predated Greek philosophy. These sources influenced such authors as Giovanni Pico della Mirandola, Leone Ebreo and Agrippa von Nettesheim. The mix of Kabbalistic learning with Neoplatonism gave rise to a wide variety of new religious interpretations, some of them like those of Guillaume Postel and Giordano Bruno, definitely heretical, and sceptical of accepted Christianity.

Another, originally less intellectual, critique of accepted Christianity was offered by Spanish mystics (usually Jewish forced converts) who claimed to be directly illuminated by God. At the beginning of the sixteenth century, some Spanish women with no theological training began offering a version of what they considered pure Christianity, gained through special non-rational practices. Despite persecution by the Spanish Inquisition, the mysticism of the *alumbrados* became a most important spiritual force, especially as expressed by Teresa of Avila and Juan de la Cruz (John of the Cross), and led many to scepticism about accepted Christian theology and the efficacy of Church practices (see Mysticism, history of §6).

Developments in science challenged accepted views in medicine, astronomy and physics. Paracelsus (§3) presented a new view of the role of medicine in relation to human nature and the cosmos; Copernicus raised questions about the accepted geocentric theory of the universe; and Bruno (§§4-5) and others cast doubt on Aristotelian science.

Some people (for example, Jardine 1983) have suggested that humanist dialectic, in placing an emphasis on techniques of persuasion and probable argumentation, was influenced by Academic scepticism as presented by Cicero. However, Lorenzo Valla (§4) rejected such nonstandard argument forms as *sorites*, and later humanist logicians failed to present a genuine informal logic of probabilities (see Logic, Renaissance §4).

All these currents none the less created an informal kind of scepticism that was pervasive in the late Renaissance world. As John Donne put it, ‘new philosophy calls all in doubt’. This informal general scepticism was often combined with an informal use of the ancient sceptical texts. References to items that appear in Sextus and Cicero are in many authors of the period. Rabelais (§2), for instance, introduced a Pyrrhonian professor as a comic foil to Pantagruel in a discussion of whether Panurge should marry. The Pyrrhonian professor uses the terms of ancient scepticism without really developing the view. Other thinkers contented themselves with a general attack on the possibility of knowledge. For instance, Agrippa von Nettesheim (§3) in his *De incertitudine et vanitate scientiarum et artium (Of the Vanity and Uncertainty of Arts and Sciences)* (1526) - a most popular work of the time, translated into many languages - attacked all kinds of intellectual activity and knowledge claims in a way that is anecdotal rather than systematic, though he did draw materials from both Cicero and Sextus.

3 Early scepticism and the Reformation

The first use of Greek scepticism in the religious controversies of the time appears in the views of Girolamo Savonarola and his leading disciple, Gianfrancesco Pico della Mirandola (1469-1533), the nephew of the great fifteenth-century humanist Giovanni Pico. Savonarola was a Dominican monk and philosophy teacher in Florence who pressed for reform of the Catholic Church. Although he campaigned against pagan philosophy, he apparently suggested the reading of Sextus as an introduction to Christian faith, and he wanted his monks to prepare a Latin translation of Sextus’ works. This did not happen, as he was condemned as a heretic and burned at the stake in 1498. His disciple, Gianfrancesco Pico, presented Sextus’ arguments for the European audience in his anti-Aristotelian work, *Examen vanitatis doctrinae gentium (An Examination of the Emptiness of Pagan Learning)* (1520). Like Savonarola, he saw Sextus’ attacks on all forms of intellectual pursuits as a way of making people accept religious revelation as the sole basis for knowledge. He made serious use of Sextus’ arguments against various ancient schools of philosophy, and he attacked Aristotelian sense-based epistemology. Pico’s work had some influence on various Renaissance thinkers, and was known to Gassendi (§3) and Leibniz (§10). It was used along with Sextus’ arguments by a Venetian rabbi in the early seventeenth century as a means of getting Jews to accept the Torah as the sole source of truth.

The early use of scepticism in the religious controversies of the Reformation is illustrated by the debate between Desiderius Erasmus (§§4, 6) and Martin Luther. Erasmus was interested in Academic scepticism as presented by

Cicero. In his *In Praise of Folly* (1511), where he criticized all kinds of philosophical views, Erasmus said that he found the Academic sceptics ‘the least surly’ of all the philosophers because they had the good sense not to dogmatically assert anything. Erasmus’ own *philosophia Christi* was an acceptance of the spirit of Christ’s teachings without buttressing them with any metaphysical principles or systems.

When Luther challenged the Church of Rome’s unique claim to determine Christian truth, Erasmus was initially supportive of this challenge to an apparently overbearing authority, but as Luther himself became more and more dogmatic in his pronouncements, Erasmus slowly withdrew his support and remained within the Catholic Church. He was urged by Catholic leaders to speak out against the Reformation and finally did so in his *Discourse on Free Will* (1524), which challenged Luther. Erasmus contended that the subject was too complicated for human beings to understand, and the Scriptures were too difficult to interpret on the matter. Because of this Erasmus recommended that one adopt the sceptical attitude of suspending judgment while accepting the traditional view, that of the Church, undogmatically.

Luther found Erasmus’ gentle scepticism, offered as a reason for remaining a Catholic, totally unacceptable. Christians, Luther insisted, cannot be sceptics, since they must be certain rather than dubious of their beliefs, given that salvation is at stake. Faith and scepticism are incompatible, for a Christian must ‘delight in assertions’. Luther declared that his erstwhile friend, Erasmus, could remain a sceptic if he wished, but he should be aware that Judgment Day was coming and that *Spiritus Sanctus non est scepticus* (‘The Holy Ghost is not a sceptic’).

The Erasmus-Luther debate raised a fundamental sceptical problem: how does one establish what criterion to employ in determining religious truth? Luther had challenged the Church’s traditional criteria (the Pope, Church councils, Church tradition), and he defiantly appealed to Scripture alone. But people’s readings of Scripture varied, and Luther then appealed to Scripture as interpreted by the Holy Spirit. This introduced what was in effect a subjective private criterion - the dictates of the Holy Spirit to each person’s conscience. In the on-going battle between Catholics and Protestants, the problem of the criterion raised by the ancient sceptics thus became a living issue, and the texts of Cicero and Sextus became a vital part of the argument.

Both Estienne and Hervet in their prefaces to their translations of Sextus said that this ancient treasury of sceptical arguments would be useful for those engaged in the religious debates of the time. In fact Hervet, who was the secretary of the Cardinal of Lorraine and a participant at the Council of Trent, said that ancient scepticism would provide the perfect answer to Calvinism, then making great inroads in France. If nothing can be known, then Calvin’s knowledge claims cannot be known; the Reformers made the same claim about Catholicism. Each side then proposed a sceptical fideism, or a Christian Pyrrhonism. If sceptical difficulties about knowledge cannot be resolved, then religious views must be accepted on the basis of faith alone.

4 Scepticism and anti-scholasticism

The sceptical texts were also used in the anti-scholastic controversies. Cicero’s *Academics* and commentaries upon it were appealed to in support of Petrus Ramus’ drive for a new non-scholastic method of understanding and teaching various subjects, and in support of Francesco Patrizi’s 1581 blast against all forms of Aristotelianism (see Ramus, P.; Patrizi da Cherso, F. §2). Some of these writers were accused of being, or were labelled by themselves, *nouveaux académiciens* or *nouveaux pyrrhoniens*, and some traditionalists decried the menace of these new sceptical groups.

An important figure in this context was Omer Talon, a close associate of Petrus Ramus in Paris. In 1547 (with a reissue in 1550) he published Cicero’s *Academics* with a lengthy introduction and a commentary. Whether or not Talon was a *nouveau académicien*, as he was accused of being, he used ancient scepticism to show the need for less dogmatism and for free inquiry in philosophizing. This would make the entrenched scholasticism of the universities less powerful, and so clear a path for Ramism.

Talon’s work was attacked by Pierre Galland, Professor at the Collège Royal, who published a polemical oration in 1551 in favour of the schools of Paris against ‘the new Academy of Petrus Ramus’. The aim of Ramus and Talon, according to their critic, was to attack the Gospel after having destroyed all of philosophy! Galland’s long oration was apparently taken sufficiently seriously that Rabelais saw fit to ridicule it. Another criticism of the *nouveaux académiciens* was written by Guy de Brués, a friend of Ramus, and a member of the group of writers, La Pléiade, connected with the great poet, Pierre Ronsard. In 1557, he published a set of dialogues in which four

actual writers of the time discuss scepticism, and the sceptic finally is led to abandon his doubts, saying ‘O miserable Pyrrho, who has made all into opinion and indifference!’ In his preface De Brués claimed he was writing in order to prevent young people from giving up religion because of sceptical doubts. The dialogues do not really bring out either the strong force of Greek sceptical arguments, or the struggle to answer them, but they indicate the importance intellectuals of the time gave to the presence of scepticism.

Another work which should be mentioned is the *Academica* of Pedro de Valencia (1596) which gives a favourable historical analysis of the development of Academic scepticism, and which ends on a fideist note, saying that God is the only source of truth.

5 Philosophical scepticism: Sanches, Montaigne, Charron

Modernized versions of ancient philosophical scepticism were advanced by two distant cousins, Francisco Sanches and Michel de Montaigne. Both were educated, though not at the same time, at the Collège de Guyenne in Bordeaux, and both also studied at the University of Toulouse, then a centre of the ferment of new philosophical and religious ideas. Sanches then studied medicine at Montpellier and Rome and became professor of philosophy and later of medicine at the University of Toulouse. Montaigne studied law and became a political figure in Bordeaux, serving as mayor of the city and a councillor to Henri de Navarre, the Protestant leader who later turned Catholic and became King Henri IV. There is no evidence that they ever knew each other or read each other’s writings, but each produced his version of modern scepticism at about the same time. Montaigne wrote the major part of his longest and most sceptical essay, ‘The Apology for Raymond Sebond’, in 1575-6, when Sanches was already at work on his book *Quod nihil scitur (That Nothing is Known)*, published in 1581.

As the title of his book suggests, Sanches (§2) was most influenced by Academic scepticism, and indeed, he makes no explicit reference to Sextus Empiricus. The main thrust of his work was an attack on Aristotelian science, viewed as a demonstrative process that employs definitions to give necessary reasons or causes for natural events. He used sceptical arguments to show that neither definitions nor syllogistic reasoning could produce knowledge, and that the appeal to knowledge of an object’s causes leads to an infinite regress. His own view was that knowledge would have to deal with particulars, each understood individually, but, he argued, human beings are incapable of reaching any certainty about individuals, both because of the unlimited and changing nature of reality, and because of our own imperfections. As a result, nothing can be known. However, again following the spirit of Academic scepticism, Sanches did allow some constructive results. Patient, careful empirical research combined with cautious judgment and evaluation of observed data will not give us certain knowledge, but it will allow us to obtain the best information available, and give us a useful way of dealing with human experience.

Montaigne explicitly rejected Academic scepticism. He regarded the claim that nothing could be known as just the kind of dogmatic assertion the sceptic should reject, and he did not approve of any appeal to probable judgment, as that too involves assertion. He preferred to follow the road of Pyrrhonian scepticism as presented by Sextus Empiricus. In ‘The Apology for Raymond Sebond’ he developed in a gradual manner the many kinds of problem that make people doubt the reliability of human reason. He cast doubt on human intellectual pretensions by comparing human abilities to those of animals; and he drew on the reports of ancient philosophers and modern explorers concerning the great variety of customs and behaviour in different parts of the planet to suggest that there was no way of determining right or true standards. He argued that even scientists were merely offering personal opinions that were likely to be replaced by other people’s opinions. Finally, he considered in more detail the unreliability of the information gained by the senses or by reason, and the inability of human beings to find a satisfactory criterion of knowledge. He concluded that people should suspend judgment on all matters, and that they should follow customs, traditions and social rules undogmatically, while being tolerant of other people’s views. He combined these conclusions with fideism. The state of complete doubt and suspension of judgment leaves the human mind ‘a blank tablet prepared to take from the finger of God such forms as he shall be pleased to engrave on it’. Religious beliefs should be based solely on faith rather than on dubious evidence (see Montaigne, M. de).

Montaigne’s Pyrrhonian scepticism was presented and popularized in didactic form by Pierre Charron (§3). In his *De la Sagesse (On Wisdom)* (1601), a work often republished during the seventeenth century, he advanced a fideistic defence of religious thought which was based on accepting complete scepticism while appealing to faith alone as the source of religious knowledge.

6 Impact of Renaissance scepticism

Renaissance scepticism, in both its informal manifestations and especially as put forth by Sanches, Montaigne and Charron, played a most important role in the development of modern thought. Seventeenth-century thinkers either accepted scepticism, offered ways of living with it, or tried to refute it. Scepticism was used by Mersenne (§2) and Gassendi (§§3-5) to attack Renaissance naturalism, astrology and alchemy, and as the basis for proposing a constructive or mitigated scepticism, a way in which the emerging modern mechanical science could be accepted hypothetically rather than as a necessarily true picture of the world. Others, such as René Descartes (§4), demanded some certainty that no sceptics could challenge, and so developed the first modern philosophical systems.

Scheler, Max Ferdinand (1874-1928)

Max Scheler, usually called a phenomenologist, was probably the best known German philosopher of the 1920s. Always an eclectic thinker, he was a pupil of the neo-idealist Rudolph Eucken, but was also strongly influenced by the life-philosophies of Dilthey and Bergson. While teaching at Jena he regularly met Husserl, the founder of the phenomenological movement, and his mature writings have a strongly phenomenological, as well as a Catholic, stamp. Later he turned towards metaphysics and the philosophical problems raised by modern science.

Scheler's interests were very wide. He tried to do justice to all aspects of experience - ethical, religious, personal, social, scientific, historical - without doing away with the specific nature of each. Above all, he took the emotional foundations of thought seriously. Many of his insights are striking and profound, and sometimes his arguments are very telling, but his power to organize his material consistently and to attend conscientiously to the business of justification is poorly developed.

Scheler is best known for his anti-Kantian ethics, based on an a priori emotional grasp of a hierarchy of objective values, which precedes all choice of goods and purposes. He himself describes his ethics as 'personalist', and makes personal values supreme, sharply distinguishing the 'person' from the 'ego', and linking this with his analysis of different types of social interaction. In epistemology he defends a pragmatist approach to science and perception; thus philosophy, as the intuition of essences, requires a preparatory ascetic discipline. His philosophy of religion is an attempt to marry the Augustinian approach through love with the Thomist approach through reason. In his later work, to which his important work on sympathy provides the transition, he defends a dualist philosophical anthropology and metaphysics, interpreting the latter in activist terms as a resolution of the tensions between spiritual love and vital impulse.

1 Life

Scheler was a Bavarian, born at Munich on 22 August 1874 to a Protestant father and a Jewish mother. He was three times married and twice divorced. He died at Frankfurt am Main, 19 May 1928.

Between 1894 and 1899 he studied at the universities of Munich, Berlin (under Dilthey), Jena (under Rudolph Eucken), and Heidelberg (to hear Max Weber). Both his doctoral promotion and habilitation were achieved underEucken. He was baptised a Catholic on 20 September 1899.

While lecturing at Jena, he had several meetings with Husserl, who helped him transfer to Munich in 1906. He quickly won a leading role among the Munich phenomenologists (see Husserl, E.; Phenomenological movement). However, irregularities in his private life led the university authorities to withdraw his license to teach. There followed a period of unofficial lecturing at Göttingen in 1910-11, thanks to the phenomenologists there, and then also in Berlin from 1912, where his first mature works began to appear: *Zur Phänomenologie und Theorie der Sympathiegefühle und von Liebe und Haß (On the Phenomenology and Theory of Sympathy and of Love and Hate)* (1913), *Der Formalismus in der Ethik und die materiale Wertethik* (*Formalism in Ethics and Non-Formal Ethics of Values*) (1913, 1916) and *Vom Umsturz der Werte (The Subversion of Values)* (1915a). Poor eyesight disqualified him from active service in the war, but he was employed by the state to give propaganda lectures.

In 1918 he was called to the chair of Philosophy and Sociology and the Directorship of the Institute of Social Sciences at Cologne, where he published *Vom Ewigen im Menschen (On the Eternal in Man)* (1921), *Die Wissensformen und die Gesellschaft (Society and the Forms of Knowledge)* (1926) and *Die Stellung des Menschen im Kosmos (The Place of Man in the Cosmos)* (1927). In 1928 he was called to Frankfurt, but died of a heart attack before he could take up office. *Philosophische Weltanschauung (Philosophical Perspectives)* was published in 1929.

2 General characteristics of his philosophy

Scheler's work is usually divided into three periods. His few early writings show the influence of Eucken's neo-idealism, and are separated by about eight years from a productive period beginning around 1912, with his second marriage, and lasting till about 1922.Scheler is here at his most phenomenological and Catholic. But in the early 1920s, at Cologne, he begins to pay less attention to what is timeless in human experience, and more to what

is changing and evolving. Theism gives place to pantheism. This change is first apparent in his sociologically inclined writings, but then dominates his metaphysics. This late work only reached the stage of partial sketches before his death.

Scheler's philosophy is hardly ever academic or dry. Like Eucken, he thought that philosophy should change people's lives, and this gives his phenomenology a very different feel from that of Husserl. Even when not primarily engaged in some critique of the modern world, as in many of his minor works, he often seems to be trying to create a change of heart in the reader. Even his metaphysics is conceived in terms of 'engagement' for the full unfolding of the deity, in which he sees the meaning of the developing universe. He never preaches, but his writings have a vital, passionate and challenging quality.

One formal key to his thought is his use of the categories of higher and lower. Like Greek and medieval thinkers, he is always revealing hierarchies: of values, forms of social relating, levels of consciousness and embodied existence, of types of being. These often furnish an effective instrument in the critique of other philosophical positions. They culminate in his late philosophical anthropology, where the hierarchical structure of human being, now focused on the duality of spirit and drive (a dualism nearer to Kant than Descartes), becomes the key to the metaphysics.

Scheler's thought is highly eclectic. His receptive mind could not help learning even from those he most strongly criticized, above all Kant. But he also took much fromSpinoza, Hegel, Schopenhauer, Nietzsche and Dilthey. Even his conscious borrowings (from Augustinianism, Malebranche,Pascal, Maine de Biran, for example) are always thoroughly assimilated. He took nothing that he could not experience for himself. It is this that gives his work its ultimate unity.

Scheler made an extremely powerful impression on his contemporaries, both academic and lay, especially as a lecturer and teacher, but also as a writer, clearing the ground in many spheres and making new beginnings or revivals possible. Had it not been for the twelve-year Nazi ban on his work, his influence on later generations would probably have been much greater. In fact, many related thinkers, including Heidegger and the early Sartre, owe more to him than is often acknowledged, and his influence in the social sciences was considerable, and is growing once more. Both the sociology of knowledge and philosophical anthropology received their initial impetus from his later work. But perhaps his greatest achievement was to re-open people's eyes to a world where vital, spiritual and religious values and phenomena (essences and necessary relations between them) could all be acknowledged in their own right, free of the monistic reductions of psychologism or positivism, or the anthropocentric distortions of Neo-Kantianism.

3 Philosophy and other forms of knowledge

Although Scheler also called himself an ethical personalist, he implies that he was already thinking along phenomenological lines when he met Husserl, by whom he was clearly influenced. However, he differs from him in important respects. Apart from a lack of interest in method as such and a refusal to follow him in his 'idealist' turn, Scheler has a different approach to the intuition of essence, the question 'what exactly is given in experience?'. Husserl saw 'phenomenological reduction', which enabled us to investigate essences without the distractions of real objects and states of affairs, as a 'bracketing' of existence, a purely intellectual operation. But Scheler interpreted existence as 'resistance to striving'. It is 'given' to us (though never known) at the lowest level of psychic functioning (analogous to Aristotle's 'vegetable soul'), where our vital impulses blindly encounter something that confines them. Thus phenomenological reduction must be an inhibition of impulse. This removes the barriers to spiritual cognition of all kinds. Philosophy thus requires a moral culture of humility, self-knowledge and self-control.

This account of philosophy occurs in *On the Eternal in Man*. Later he calls it *Bildungswissen*, or knowledge for 'formation', since spiritual persons are 'formed' by the essences and values that become part of them. All knowing is, in Greek and Scholastic fashion, 'having a share in' an object without changing it. The object known, *qua* essence, is henceforward 'in' the mind of the knower. Philosophy is also a 'desymbolization of the world'. Our natural, self- or group-centred 'vital' approach to things (later writers talk of the 'life-world') rests on a classification according to vital importance. Perception itself thus selects from the totality of the given. The partial aspects of an object's nature that we take in (the redness of a cherry, for example) function as symbols of the

object both as it essentially is and as it relates to our purposes. But the philosophical inhibition of impulse enables us to get beyond the screen of concepts to the entire essential nature, and see what ‘can only be seen’.

The ‘natural worldview’ given in culture and language is the basis for control over our environment. Knowledge from this viewpoint can, however, be as adequate as that of philosophy or, at the other extreme, science. But its objects are relative to the concerns of the human species (with cultural modifications). Scientific objects, on the other hand, are relative to those of living beings as such, since science transcends the limits of human sensory equipment, and thus the range of human concerns. The world as reduced by science, largely unintelligible in terms of our sensory imaginations, is an almost pure (and largely probabilistic) schema of the world, from which the essential content of things has almost disappeared. The schema is structured as a device for control, the world of pure pragmatism. Scientific knowledge is thus *Leistungswissen*, or knowledge for achievement.

The third form of knowledge is *Heilswissen*, or knowledge for salvation. In Scheler’s Catholic period, salvation concerns moral and religious knowledge and practice, and the salvation of the spiritual individual as member of the ‘community of love’. But in the last period *Heilswissen* is metaphysics, and salvation itself concerns the resolution of all tensions and oppositions in the absolute being, whose spirit is the sphere of emergent essences and whose body is the material universe. Human beings provide the arena where this reconciliation of the spiritual and the material takes place. Thus metaphysics is engagement for the deity, an active spiritual love of essences and values together with an ecstatic participatory ‘yes’ to the blind processes of material and vital energy. The *Nachlaß* volumes which supplement the last lectures and papers show us something more of this grand conception, but very little is worked out in any detail.

4 Ethics

Scheler’s ethics depends on his theory of value, which did not change in his last years. His first phenomenological and Catholic works are, *inter alia*, concerned to defend the objectivity of values and a less materialistic approach to the world. Among his particular targets are Nietzsche, with his attack on Christian morality, and the utilitarian or calculating attitude to morals, based on an all-devouring resentment (‘Das Ressentiment im Aufbau der Moralen’ (Resentment in the Structure of Morals) (1915)) and the elevation of hedonic values above those of vitality. His great ethical treatise, *Formalism in Ethics and Non-Formal Ethics of Values*, rich in subtle analyses and distinctions, is primarily intended as a refutation of Kantian ethics, together with the philosophical assumptionsKant uses to justify his position (see Kantian ethics). The huge, rambling, but immensely impressive work has six parts, each criticizing some specific Kantian theme.

In the course of it Scheler defends his thesis that values are the intentional objects of feeling. They are qualities felt in or on objects, and are hence inaccessible to the understanding. They constitute an ‘emotional a priori’, since the phenomena of goods and purposes, and even the attractions of pleasure, presuppose them. Far from being formal, they are given to us, in positive and negative forms, in distinct kinds of material and in a hierarchical order, with the hedonic or sensory values at the bottom, then those of vitality, then spiritual values of beauty, justice and assent to pure (non-pragmatic) truth, and lastly the values of holiness. A separate category of welfare values is sometimes inserted between the hedonic and the vital. There are also other hierarchies of ‘relatively formal’ values, depending on the nature of the value-bearers concerned. But moral values are personal and of a logically second order. A person’s act has moral value when it intends the realization of a first-order value intrinsically higher than the given alternatives. Since choice of value depends on the structure of one’s loving, the main foundation of personal being (see *Bildungswissen* above), Scheler’s ethics has something in common with virtue ethics, and a corresponding distaste for moral obligation, though this is accepted as a regrettable necessity. It also contains illuminating discussions of ethical relativism (where he defends the absoluteness of values as such against various relativities of ethos, ethic, moral code and moral conduct), levels of the emotional life, and retribution and punishment.

5 The person and society

The last section of *Formalism in Ethics and the Non-Formal Ethics of Values* is a long treatise on the person as individual and social being. The influence of Kant is strong in the first part, though Scheler insists that the spiritual person is not just a rational or intellectual being, but also performs emotional acts, acts of will and, above all, acts of love. These depend on the otherwise ‘automatic’ mental functioning of the ‘ego’, ‘through’ which the

'functional unity' of the person acts, thereby raising ego-functioning to a higher level, where questions of meaning and validity are inescapable.

The analyses of forms of social relating begin from the distinction between community and association, but are illuminatingly extended, and integrated with the value-philosophy and analysis of the individual person. Scheler's interesting treatment of the problem of 'other minds' comes in *Wesen und Formen der Sympathie* (*The Nature of Sympathy*) (see Other minds). He here argues that the acquisition of knowledge is, *inter alia*, a matter of filling with particular content and in a definite order the initially empty spheres of being which are given to human consciousness as such. The social sphere (a possibly unfulfilled experience of 'we') is, in fact, filled before the sphere of individuality. Hence the main assumption of the 'problem' of other minds, that self-awareness must come first, is the false insinuation of 'individualism'. Our actual knowledge of the ego-functioning of other egos depends on the 'universal grammar of expression' to which we have access as living beings; in so far as this behaviour is raised to the dignity of spiritual activity, we can know it by performing the acts 'with' or 'after' the persons concerned.

6 Religion

The theory of spheres of being goes with a theory of specific spiritual acts relating to the typical contents of each sphere. In *On the Eternal in Man* Scheler argues that at some time or other we all perform religious acts, which include repentance, petitionary prayer, thanks, praise and worship, in relation to the absolute sphere. It is only through performing such acts that we fully grasp the meaning of holiness, the highest value. This gives us a key to answering the most fundamental question: whether our own religious acts are directed to an adequate object, or only to an idol, such as knowledge, fame or comfort. He also held that the absolute sphere of being is the first to be given some determinate content. Since religious acts presuppose the absoluteness and holiness of their object, which for Scheler denotes the supreme Good, our first and most deeply bedded experiences are of perfect objects and absolute qualities.

This religious, or 'Augustinian', road to God, open to all who try to work out their salvation in practical life, has its counterpart in a philosophical road, which starts from wonder and a concern to grasp the nature of ultimate reality. Scheler briefly expounds the 'three fundamental philosophical truths' in 'Probleme einer Soziologie des Wissens' (*Problems of a Sociology of Knowledge*) (1926). They are, first, that there is 'something and not nothing', second, that existing beings must either be absolute or dependent on something else for their own being, and third, that all being has both essence and existence. Scheler insists that the first two have an emotional content, which can only be grasped in wonder, humility and reverence, and a shuddering glance into the abyss of absolute nothingness. The absolute being which can thus be directly cognized is in complete 'conformity' with the perfect being encountered in religious acts. The two approaches to God are complementary.

7 Sympathy

We may finally return to *The Nature of Sympathy*, which many critics have considered his best work. The general importance of the emotional inScheler's thought is clear, but this work also contains some excellent phenomenological analysis of the different types of sympathy itself, ignored by most writers of 'sympathy ethics'. He goes on to discuss metaphysical theories of sympathy, especially Schopenhauer's, and devotes much attention to *Einsfühlung* ('feeling one with'), which is needed for the 'engagement' of the later metaphysics. The second part of the work contains an analysis of love and hate. Love is the key to the spiritual and personal, since only love opens up the world of essences and values. Humanity is, for Scheler, the *Ens amans*, the being that loves. His own analysis of love as a creative movement of the heart which brings out the higher values of its objects (hatred is destructive, working in a contrary direction) is difficult but profound. The metaphysical writings introduce us to *Eros* or vital love, which plays an important role in his account of evolution, and in the metaphysical reconciliation between spirit and drive.

FRANCIS DUNLOP

List of works

Scheler, M.F. (1954) *Gesammelte Werke (Collected Works)*, Bonn: Bouvier Verlag. (Vols 10-14 contain papers and fragments from the *Nachlaß*.)

Scheler, M.F. (1899) *Beiträge zur Feststellung der Beziehungen zwischen den logischen und ethischen Prinzipien(On the Relations between Logical and Ethical Principles)*, Jena: Vopelius; in *Gesammelte Werke*, vol. 1.(Aspects of the opposition between thought and action, the true and the good.)

Scheler, M.F. (1900) *Die transcendentale und die psychologische Methode (The Transcendental and Psychological Methods)*, Jena: Dürr; in *Gesammelte Werke*, vol. 1.(Dialectical critique of the transcendental and psychological methods in philosophy and establishment of the 'noological'.)

Scheler, M.F. (1913) *Zur Phänomenologie und Theorie der Sympathiegefühle und von Liebe und Haß (On the Phenomenology and Theory of Sympathy, and of Love and Hate)*, Halle: Max Niemeyer.(Phenomenology and theories of sympathy and love; essay on 'other minds'.)

Scheler, M.F. (1913, 1916) *Der Formalismus in der Ethik und die materiale Wertethik*, Halle: Max Niemeyer; in *Gesammelte Werke*, vol. 2; trans. M.S. Frings and R. Funk, *Formalism in Ethics and Non-Formal Ethics of Values*, Evanston, IL: Northwestern University Press, 1973.(Scheler's own position on values and goals, the a priori, consequentialism, imperatives, eudaimonism and the person discussed in opposition to Kant.)

Scheler, M.F. (1915a) *Vom Umsturz der Werte (The Subversion of Values)*, Leipzig: Verlag der weißen Bücher, 2 vols; in *Gesammelte Werke*, vol. 3.(A collection of ethical and phenomenological papers on virtue, ressentiment, human nature, self-knowledge and other topics. Includes 'Das Ressentiment im Aufbau der Moralen', trans. W. Holdheim, ed. Lewis A. Coser, *Ressentiment*, New York, The Free Press of Glencoe, 1961.)

Scheler, M.F. (1915b) *Der Genius des Krieges und der deutsche Krieg (The Spirit of War and the German War)*, Leipzig: Verlag der weißen Bücher; in *Gesammelte Werke*, vol. 4. (Philosophical discussion of war, with special application to the First World War.)

Scheler, M.F. (1917) *Die Ursachen des Deutschenhasses (Why the Germans are Hated)*, Leipzig: Kurt Wolff; in *Gesammelte Werke*, vol. 4.(A moral-pedagogical call to the nation on the basis of psychological analysis.)

Scheler, M.F. (1921) *Vom Ewigen im Menschen*, Leipzig: Neue Geist; in *Gesammelte Werke*, vol. 5; trans. B. Noble, *On the Eternal in Man*, London: SCM Press, 1960.(The nature of philosophy, religion and Christian love.)

Scheler, M.F. (1923) *Wesen und Formen der Sympathie*, Bonn: Friedrich Cohen; in *Gesammelte Werke*, vol. 7; trans. P. Heath, *The Nature of Sympathy*, London, Routledge & Kegan Paul, 1954.(As (1913) with much additional material on the metaphysics of sympathy.)

Scheler, M.F. (1923-4) *Schriften zur Soziologie und Weltanschauungslehre (Papers on Sociology and the Theory of Worldviews)*, Leipzig: Neue Geist; in *Gesammelte Werke*, vol. 6.(Subjects include suffering, love and knowledge, national characteristics in thinking, and Christian social problems.)

Scheler, M.F. (1926) *Die Wissensformen und die Gesellschaft (Society and the Forms of Knowledge)*, Leipzig: Neue Geist; in *Gesammelte Werke*, vol. 8.(Contains 'Probleme einer Soziologie des Wissens', trans. M.S. Frings, ed. K.W. Stikkers, *Problems of a Sociology of Knowledge*, London, Routledge & Kegan Paul, 1980. Also contains the important 'Knowledge and Work: the limits of the pragmatic approach in our world-knowledge'.)

Scheler, M.F. (1927) 'Idealismus-Realismus', in *Philosophischer Anzeiger II*, Bonn: Friedrich Cohen; in *Gesammelte Werke*, vol. 9.(Unfinished; includes material on the metaphysical foundations of knowledge.)

Scheler, M.F. (1928) *Die Stellung des Menschen im Kosmos*, Darmstadt: Otto Reichl; in *Gesammelte Werke*, vol. 9; trans. H. Meyerhoff, *Man's Place in Nature*, New York, Noonday Press, 1961.(Important summary of Scheler's work in philosophical anthropology.)

Scheler, M.F. (1929) *Philosophische Weltanschauung*, Bonn: Friedrich Cohen; in *Gesammelte Werke*, vol. 9; trans. O. Haac, *Philosophical Perspectives*, Boston, MA, Beacon Press, 1958.(Papers on forms of knowledge, history, the future of man, Spinoza.) >

Schelling, Friedrich Wilhelm Joseph von (1775-1854)

Like the other German Idealists, Schelling began his philosophical career by acknowledging the fundamental importance of Kant's grounding of knowledge in the synthesizing activity of the subject, while questioning his establishment of a dualism between appearances and things in themselves. The other main influences on Schelling's early work are Leibniz, Spinoza, J.G. Fichte and F.H. Jacobi. While adopting both Spinoza's conception of an absolute ground, of which the finite world is the consequent, and Fichte's emphasis on the role of the I in the constitution of the world, Schelling seeks both to overcome the fatalism entailed by Spinoza's monism, and to avoid the sense in Fichte that nature only exists in order to be subordinated to the I. After adopting a position close to that of Fichte between 1794 and 1796, Schelling tried in his various versions of Naturphilosophie *from 1797 onwards to find new ways of explicating the identity between thinking and the processes of nature, claiming that in this philosophy 'Nature is to be invisible mind, mind invisible nature'. In his System des transcendentalen Idealismus (System of Transcendental Idealism)1800) he advanced the idea that art, as the 'organ of philosophy', shows the identity of what he terms 'conscious' productivity (mind) and 'unconscious' productivity (nature) because it reveals more than can be understood via the conscious intentions that lead to its production. Schelling's 'identity philosophy', which is another version of his* Naturphilosophie*, begins in 1801, and is summarized in the assertion that 'Existence is the link of a being as One, with itself as a multiplicity'. Material nature and the mind that knows it are different aspects of the same 'Absolute' or 'absolute identity' in which they are both grounded. In 1804 Schelling becomes concerned with the transition between the Absolute and the manifest world in which necessity and freedom are in conflict. If freedom is not to become inexplicable, he maintains, Spinoza's assumption of a logically necessary transition from God to the world cannot be accepted. Philosophische Untersuchungen über das Wesen der menschlichen Freiheit und die damit zusammenhängenden Gegenstände (Of Human Freedom) (1809) tries to explain how God could create a world involving evil, suggesting that nature relates to God somewhat as the later Freud's 'id' relates to the developed autonomous 'ego' which transcends the drives which motivate it.*

The philosophy of Die Weltalter (The Ages of the World), on which Schelling worked during the 1810s and 1820s, interprets the intelligible world, including ourselves, as the result of an ongoing conflict between expansive and contractive forces. He becomes convinced that philosophy cannot finally give a reason for the existence of the manifest world that is the product of this conflict. This leads to his opposition, beginning in the 1820s, to Hegel's philosophical system, and to an increasing concern with theology. Hegel's system claims to be without presuppositions, and thus to be self-grounding. While Schelling accepts that the relations of dependence between differing aspects of knowledge can be articulated in a dynamic system, he thinks that this only provides a 'negative' philosophy, in which the fact of being is to be enclosed within thought. What he terms 'positive' philosophy tries to come to terms with the facticity of 'being which is absolutely independent of all thinking' (2 (3): 164). Schelling endeavours in his Philosophie der Mythologie (Philosophy of Mythology) and Philosophie der Offenbarung (Philosophy of Revelation) of the 1830s and 1840s to establish a complete philosophical system by beginning with 'that which just exists…in order to see if I can get from it to the divinity' (2 (3): 158), which leads to a historical account of mythology and Judeo-Christian revelation. This system does not, though, overcome the problem of the 'alterity' of being, its irreducibility to a philosophical system, which his critique of Hegel reveals. The direct and indirect influence of this critique on Kierkegaard, Nietzsche, Heidegger, Rosenzweig, Levinas, Derrida and others is evident, and Schelling must be considered as the key transitional figure between Hegel and approaches to 'post-metaphysical' thinking.

1 Transcendental philosophy and *Naturphilosophie* (1795-1800)

Schelling was born in Leonberg, near Stuttgart, on 27 January 1775. He attended a Protestant seminary in Tübingen from 1790 to 1795, where he was close friends with both Hegel and Friedrich Hölderlin. He moved to Leipzig in 1797, then to Jena, where, via Goethe's influence, he took up his first professorship from 1798 to 1803. From 1803 to 1806 he lived in Würzburg, whence he left for Munich, where he mainly lived from 1806 onwards, with an interruption from 1820 to 1827, when he lived in Erlangen. He moved to Berlin in 1841 to take up what had been Hegel's chair of philosophy. He died on 20 August 1854 in Ragaz, Switzerland.

Schelling's early philosophy was inspired by the French Revolution and by the revolution in philosophy

inaugurated by Kant, particularly as interpreted in the work of J.G. Fichte. The tensions in Schelling's philosophy of this period, which set the agenda for most of his subsequent work, derive from a series of related sources. In the view of the early Schelling, Kant failed to explain the nature of the subject's knowledge of itself: in Kantian terms knowledge could only result from judgments, the synthesis by the subject of intuitions which were given to it from the external world. Although the subject was the condition of possibility or ground of *knowledge*, it seemed unable to ground itself. Kant regards the condition of possibility of the syntheses of knowledge as a 'spontaneity', as cause of itself rather than as the result of other natural causes, but does not succeed in explicating this spontaneity. Along with Kant's approach to the question of grounding knowledge, the most significant other approaches to the issue for Schelling were those of F.H. Jacobi and Fichte.

In 1783 Jacobi became involved in the 'Pantheism controversy', an influential dispute with the Berlin Enlightenment philosopher Moses Mendelssohn over the claim that G.E. Lessing had admitted to being a Spinozist, an admission which at that time was regarded as tantamount to an admission of atheism. In his *Über die Lehre von Spinoza in Briefen an den Herrn Moses Mendelssohn (On the Doctrine of Spinoza in Letters to Herr Moses Mendelssohn)* (1785; 2nd, revised edition 1789), which was influenced by his reading of Kant's first *Critique*, Jacobi revealed a problem which recurs in differing ways throughout Schelling's work. Jacobi's interpretation of Spinozism was concerned with the relationship between what he termed the 'unconditioned' and the 'conditioned', between God as the ground of which the laws of nature are the consequent, and the chain of the deterministic laws of nature. Cognitive explanation relies, as Kant suggested, upon finding a thing's 'condition'. Jacobi's question is how this can ultimately ground the explanation, in that the explanation leads to a regress in which each condition depends upon another condition *ad infinitum*. Any philosophical system thus 'necessarily ends by having to discover *conditions* of the *unconditioned*'. For Jacobi this led to the need for a theological leap of faith if philosophy were to be grounded. In the 1787 Introduction to the first *Critique* Kant maintains that this problem can be overcome by acknowledging that, while reason must postulate the 'unconditioned…in all things in themselves for everything conditioned, so that the series of conditions should thus become complete', by restricting knowledge to appearances, rather than 'things in themselves', the contradiction of seeking conditions of the unconditioned can be avoided.

The condition of the knowledge of appearances for Kant was the 'transcendental subject', but what sort of 'condition' was the transcendental subject? This problem initially united Schelling and Fichte. Fichte insisted in *Wissenschaftslehre* that the establishing of the unconditioned status of the I was required for Kant's system to legitimate itself. He asserts that 'It is…the ground of explanation of all facts of empirical consciousness that before all positing in the I, the I itself must previously be posited', thereby giving the I the founding role which he thought Kant had failed adequately to explicate. Fichte does so by suggesting that the cognitive activity of the I, via which it can reflect upon *itself*, cannot therefore be understood as part of the causal world of appearance and must therefore be part of the noumenal realm, where Kant had located the 'unconditioned'.

Schelling takes up the problems posed by Jacobi and Fichte in two texts of 1795: *Vom Ich als Prinzip der Philosophie oder über das Unbedingte im menschlichen Wissen (Of the I as Principle of Philosophy or on the Unconditional in Human Knowledge)*, and *Philosophische Briefe über Dogmatismus und Kriticismus (Philosophical Letters on Dogmatism and Criticism)*. He reinterprets Kant's question as to the condition of possibility of synthetic judgments a priori as a question about why there is a realm of judgments, a manifest world requiring syntheses by the subject, at all. In *Of the I* Schelling puts Kant's question in Fichtean terms: 'How is it that the absolute I goes out of itself and opposes a Not-I to itself?'. He maintains that the condition of knowledge, the 'positing' by the I of that which is opposed to it, must have a different status from what it posits: 'nothing can be posited by itself as a thing, that is, an absolute/unconditioned thing (*unbedingtes Ding*) is a contradiction'. However, his worry about Fichte's position already becomes apparent in the *Philosophical Letters*, where he drops the Fichtean terminology: 'How is it that I step at all out of the Absolute and move towards something opposed [*auf ein Entgegengesetztes*]?'. The problem Schelling confronted was identified by his friend J.C.F. Hölderlin, in the light of Jacobi's formulation of the problem of the 'unconditioned'. Fichte wished to understand the Absolute as an I. For something to be an I, though, it must be conscious of an other, and thus in a relationship to that other. The overall structure of the relationship could not, therefore, be described from only one side of that relationship. Hölderlin argued that one has to understand the structure of the relationship of subject to object in consciousness as grounded in 'a whole of which subject and object are the parts', which he termed 'being'.

Schelling sought a philosophical way to come to terms with the 'ground' of the subject's relationship to the object world, which avoided the fatalist consequences of Spinoza's system by taking on key aspects of Kant's and Fichte's transcendental philosophy and yet which did not fall into the trap Hölderlin identified in Fichte's conception of an absolute I. In his *Naturphilosophie* (Philosophy of Nature), which emerges in 1797 and develops in the succeeding years, and in the *System des transcendentalen Idealismus* (*System of Transcendental Idealism*) (1800) Schelling wavers between a Spinozist and a Fichtean approach to the problem of the 'unconditioned' (see Naturphilosophie; Spinoza, B. §§2-4). In the *Naturphilosophie* the Kantian division between the appearing world of nature and nature in itself results from the fact that the nature theorized in cognitive judgments is wholly objectified in opposition to the knowing subject. This fails to account for the living dynamic forces in nature, including those in our own organism, with which Kant himself became concerned in the third *Critique* and other late work, and which had played a role in Leibniz's account of nature. Schelling thinks of nature in itself as a 'productivity': 'As the object [*qua* conditioned condition] is never absolute/unconditioned (*unbedingt*) then something *per se* non-objective must be posited in nature; this absolutely non-objective postulate is precisely the original productivity of nature'. The Kantian dualism between things in themselves and appearances is a result of the fact that the productivity can never appear as itself and can only appear in the form of 'products', which are the productivity 'inhibiting' itself. The products are never complete in themselves: they are like the eddies in a stream, which temporarily keep their shape, despite the changing material flowing through them.

Schelling then tries to use the insights of transcendental philosophy, while still avoiding Kant's dualism, to explain our knowledge of nature. Given the fact of knowledge, things in themselves and 'representations' cannot be absolutely different:

> One can push as many transitory materials as one wants, which become finer and finer, between mind and matter, but some time the point must come where mind and matter are One, or where the great leap that we so long wished to avoid becomes inevitable.
>
> (1797, 1 (2): 53)

The *Naturphilosophie* includes ourselves within nature, as part of a necessarily interrelated whole, which is structured in an ascending series of 'potentials' that entail a polar opposition within themselves. The model is a magnet, whose opposing poles are inseparable from each other, even though they are opposites. As productivity, nature cannot be conceived of as an object, since it is the subject of all possible real 'predicates', but its 'inhibiting' itself means that the 'principle of all explanation of nature' is 'universal duality', an inherent difference of subject and object which prevents nature from ever reaching stasis. The sense of nature as an absolute subject links it to the spontaneity of the thinking subject, which is the condition of the syntheses required for the constitution of objectivity. The problem for Schelling lies in explicating how these two subjects relate to each other.

In the *System of Transcendental Idealism* Schelling returns to Fichtean terminology, though he soon finally abandons it. He endeavours to explain the emergence of the thinking subject from nature. This emergence is thought of in terms of an absolute I coming retrospectively to know itself in a 'history of self-consciousness'. The *System* recounts the history of which the transcendental subject is the result. A version of the model Schelling establishes was to be adopted by Hegel in the *Phenomenology of Mind*. Schelling conceives of the whole process in terms of the initially undivided I splitting itself in order to articulate itself in the syntheses, the 'products', which constitute the world of knowable nature. The founding stages of this process, which bring the world of material nature into being, are 'unconscious'. These stages then lead to organic nature, and thence to consciousness and self-consciousness. Schelling claims that the resistance of the noumenal realm to theoretical knowledge results from the fact that 'the [practical] act [of the absolute I] via which all limitation is posited, as condition of all consciousness, does not itself come to consciousness'. He prophetically attempts to articulate a theory which comes to terms with the awareness that thought is driven by forces which are not finally transparent to it, of the kind later to become familiar in psychoanalysis. How, though, does one gain access by thought to what cannot be an object of consciousness?

Schelling adopts the idea from the early Romantic thinkers Friedrich Schlegel and Novalis, whom he knew in Jena at this time, that art is central to understanding what cannot appear as an object of knowledge. Philosophy cannot represent nature in itself because access to the sphere of the unconscious must be via what appears to

consciousness in the realm of theoretical knowledge. The work of art is an empirical object, but if it is not more than what it is *qua* determinable object it cannot be a work of art, which requires the free judgment of the subject. Although the *System* depends upon the transition from theoretical to practical philosophy, which involves breaking Jacobi's chain of 'conditions', Schelling is concerned to understand how the highest insight must yet be into reality as a product of the interrelation of both the 'conscious' and the 'unconscious'. It is not, therefore, a re-presentation of the latter by the former. Whereas in the *System* nature begins unconsciously and ends in consciousness, in the work of art: 'the I is conscious according to the production, unconscious with regard to the product'. The product cannot be understood via the intentions of its producer, as this would mean that it became a 'conditioned' object, which would lack that which makes mere craft into art. Art is 'the only true and eternal organ and document of philosophy, which always and continuously documents what philosophy cannot represent externally'. The particular sciences can only follow the chain of conditions, via the principle of sufficient reason, and must determine the object via its place in that infinite chain. The art object, on the other hand, manifests what cannot be understood in terms of its knowable conditions, in that an account of the materials of which it is made does not constitute it as art. It shows what cannot be said. Philosophy, therefore, cannot positively represent the Absolute, because 'conscious' thinking operates from the position where 'absolute identity' has always already been lost in the emergence of consciousness.

2 Identity philosophy (1801-*c.*1808)

Although the period of Schelling's 'identity philosophy' is usually dated from the 1801 *Darstellung meines Systems der Philosophie* (Presentation of My System of Philosophy) until some time before the 1809 *Philosophische Untersuchungen über das Wesen der menschlichen Freiheit und die damit zusammenhängenden Gegenstände* (*Of Human Freedom*), the project of that philosophy is carried on in differing ways throughout his work. The identity philosophy derives from Schelling's conviction that the self-conscious I must be seen as a result, rather than as the originating act as it is in Fichte, and thus that the I cannot be seen as the generative matrix of the whole system. Again, the problem is to articulate the relationship between the I and the world of material nature, without either reverting to Kantian dualism or falling into the traps of idealism and materialism.

Schelling's mature identity philosophy, which is contained in *System der gesammten Philosophie und der Naturphilosophie insbesondere (System of the Whole of Philosophy and of the Philosophy of Nature in Particular)*, written in Würzburg in 1804, and in other texts between 1804 and 1807, breaks with the model of truth as correspondence:

> It is clear that in every explanation of the truth as a correspondence [*Übereinstimmung*] of subjectivity and objectivity in knowledge, both, subject and object, are already presupposed as separate, for only what is different can agree, what is not different is in itself one.
>
> (1804a, 1 (6): 138)

The crucial problem is explaining the link of the subject and object world, which is what makes judgments possible. For there to be synthetic judgments at all, what is split must, Schelling contends, in some way already be the same (see Truth, correspondence theory of). This has often been understood as leading Schelling to a philosophy in which, as Hegel puts it in the *Phenomenology*, the Absolute is the 'night in which all cows are black', because it swallows all differentiated knowledge in the assertion that everything is ultimately the same. This is not a valid interpretation of Schelling's argument.

In order to get over the problem in monism, of how the One is also the many, Schelling introduces the notion of 'transitive' being, which links mind and matter as predicates of itself. Schelling explains this 'transitivity' via the metaphor of the earth:

> You recognize its [the earth's] true essence only in the link by which it eternally posits its unity as the multiplicity of its things and again posits this multiplicity as its unity. You also do not imagine that, apart from this infinity of things which are in it, there is another earth which is the unity of these things, rather *the same* which is the multiplicity is also unity, and *what* the unity is, is also the multiplicity, and this necessary and indissoluble One of unity and multiplicity in it is what you call its existence… Existence is the link of a being [*Wesen*] as One, with itself as a multiplicity.
>
> (1806a, 1 (7): 56)

‘Absolute identity’ is the link of the two aspects of being, which, on the one hand, is the universe, and, on the other, is the changing multiplicity which the knowable universe also is. Schelling insists now that ‘The *I* think, *I* am, is, since Descartes, the basic mistake of all knowledge; thinking is not my thinking, and being is not my being, for everything is only of God or the totality’: the I is ‘affirmed’ as a predicate of the being by which it is preceded.

Schelling is led to this view by his understanding of the changing and relative status of theoretical knowledge. It is the inherent incompleteness of all finite determinations which reveals the nature of the Absolute, as is evident in his description of time: ‘time is itself nothing but *the totality appearing in opposition to the particular life of things*’, so that the totality ‘posits or intuits itself, by not positing, not intuiting the particular’. The particular is determined in judgments, but the truth of claims about the totality cannot be proved because judgments are necessarily conditioned, whereas the totality is not. Given the relative status of the particular, though, there must be a ground which enables us to be aware of that relativity: this ground must have a different status from the knowable world of finite particulars. At the same time, if the ground were wholly different from the world of relative particulars the old problems of dualism would recur. As such the Absolute *is* the finite, but we do not *know* this in the manner in which we know the finite. Without the presupposition of ‘absolute identity’, therefore, the evident relativity of particular knowledge becomes inexplicable, since there would be no reason to claim that a revised judgment is predicated of the same as the preceding - now false - judgment.

Schelling summarizes the theory of identity as follows:

> For being, actual, real being is precisely self-disclosure/revelation (*Selbstoffenbarung*). If it is to be as One then it must disclose/reveal itself in itself; but it does not disclose/reveal itself in itself if it is not an other in itself, and is *in* this other the One for itself, thus if it is not absolutely the living link of itself and an other.
>
> (1806a, 1 (7): 54)

The link between the ‘real’ and the ‘ideal’, the physical and the mental, cannot, Schelling maintains, be seen as a causal link. Although there cannot be mental events without physical events, the former cannot be causally reduced to the latter: ‘For real and ideal are only different views of one and the same substance’. Schelling wavers at this time between a position of the kind which Hegel soon tried to articulate, in which, in Schelling’s terms, ‘the sameness of the subjective and the objective is made the same as itself, knows itself, and is the subject and object of itself’, in the ‘identity of identity and difference’, and the sense that this position cannot finally circumscribe the structure of the Absolute. The structure of reflection, where each aspect mirrors itself and then is mirrored in the other, upon which this account of the identity of subject and object relies, must be grounded in a being which carries it:

> Reflection…only knows the universal and the particular as two relative negations, the universal as relative negation of the particular, which is, as such, without reality, the particular, on the other hand, as a relative negation of the universal… something independent of the concept must be added to posit the substance as such.
>
> (1804a, 1 (6): 185)

Without this independent basis, subject and object would merely be, as Schelling thinks they are in Fichte, relative negations of each other, leading to a circle ‘inside which a nothing gains reality by the relation to another nothing’. Schelling prophetically distinguishes between the cognitive - reflexive - ground of finite knowledge, and the real - non-reflexive - ground that sustains the movement of negation from one finite determination to another. As a two-sided relationship, reflection alone always entails the problem that the subject and the object in a case of reflection can only be *known* to be the same via that which cannot appear in the reflection: if I am to recognize *myself* in a mirror, rather than a random object in the world, I must already be familiar with myself before the reflection. This means a complete system based on reflection is impossible, because, in order to ground the system, it must presuppose as external to the system what it claims is part of it. From the 1820s onwards, Schelling raises this objection against Hegel’s system of ‘absolute reflection’.

Schelling’s own dissatisfaction with his early versions of identity theory derives from his rejection of Spinozism. Spinoza saw the move from God to the world of ‘conditions’ as a logical consequence of the nature of God. Schelling becomes convinced that such a theory gives no reason why the Absolute or the ‘unconditioned’ should

manifest itself in a world of negative ‘conditions’ at all. Schelling is confronted with the task of explaining the transition from the Absolute to the finite world. In *Philosophie und Religion (Philosophy and Religion)* (1804), he claims, like Jacobi, that there is no way of mediating between conditioned and unconditioned, and already makes the distinction between ‘negative’ and ‘positive’ philosophy, which will form the heart of his late work. Explicating the structure of the finite world leads to ‘negative philosophy, but much has already been gained by the fact that the negative, the realm of nothingness, has been separated by a sharp limit from the realm of reality and of what alone is positive’. The next stage of his philosophy will become concerned with the transition between infinite and finite.

3 The *Ages of the World* (1809-*c.*1827)

Schelling’s work from his middle period is usually referred to as the philosophy of *Die Weltalter* (*Ages of the World*). It begins with *Philosophische Untersuchungen über das Wesen der menschlichen Freiheit und die damit zusammenhängenden Gegenstände* (*Of Human Freedom*) (1809), written in Stuttgart, and lasts until the late 1820s. The *Weltalter* philosophy is an attempt to explain the emergence of an intelligible world at the same time as coming to terms with the inextricable relation of mind to matter. The initial concern is to avoid Spinoza’s fatalism, which renders the human freedom to do good *and* evil incomprehensible. Schelling’s crucial objection is to the idea that evil should be understood as merely another form of negativity, which can therefore be understood by insight into a necessitated totality, rather than as a fact relating to the nature of human freedom. He now sees the fundamental contradictions of the *Naturphilosophie* in terms of the relationship of the intelligibility of nature and ourselves to a ground without which there could be no intelligibility, but to which intelligibility cannot be reduced. In *Of Human Freedom* he introduces, against both Spinoza and Fichte, a conception of ‘willing’, which was later influential for Schopenhauer’s conception of the ‘Will’: ‘In the last and highest instance there is no other being but willing. Willing is primal being, and all the predicates of primal being only fit willing: groundlessness, eternity, being independent of time, self-affirmation’ (1809, 1 (7): 350). Schelling establishes a more antagonistic version of the structure of the identity philosophy. The ‘ground’ is now in one sense ‘groundless’, that is, uncaused: it must be understood in terms of freedom, if Spinozism is to be avoided. At the same time there must be that against which freedom can be manifest for it to be freedom at all. The theory is based on the antagonisms between opposing forces which constitute the ‘ages of the world’. He argues, though, that the world whose origins the *Weltalter* wishes to understand must entail the *same* conflicting forces which still act, though not necessarily in the same form, in this world, of which the mind is an aspect: ‘Poured from the source of things and the same as the source, the human soul has a co-knowledge/con-science (*Mitwissenschaft*) of creation’. Schelling suggests that there are two principles in us: ‘an unconscious, dark principle and a conscious principle’, which must yet in some way be identical. The same structure applies to what Schelling means by ‘God’. As that which makes the world intelligible, God relates to the ground so that the ‘real’, which takes the form of material nature, is ‘in God’ but ‘is not God seen absolutely, that is, in so far as He exists; for it is only the ground of His existence, it is "nature" in God; an essence which is inseparable from God, but different from Him’. The point is that God would be meaningless if there were not that which God transcends: without opposition there is no life and no sense of development.

Wolfram Hogrebe has convincingly claimed that the *Weltalter* philosophy is a theory of predication (1989). In it, being is initially One, is not manifest and has no reason to be manifest: Hogrebe terms this ‘pronominal being’. The same being, given that there is now a manifest world, must also be ‘predicative being’ (*ibid.*), which ‘flows out, spreads, gives itself’. The contradiction is only apparent. Schelling maintains in line with the identity philosophy that the ‘properly understood law of contradiction really only says that the same cannot be *as the same* something and also the opposite thereof, but this does not prevent the same, which is A, being able, as an other, to be not A’. One aspect of being, the dark force, which he sometimes terms ‘gravity’, is contractive, the other expansive, which he terms ‘light’. Dynamic processes are the result of the interchange between these ultimately identical forces. If something is to be *as* something, it must both be, in the positive sense in which everything else is, which makes it indeterminately positive, and it must have a relationship to what it is not, in order to be determinate. In the *Weltalter* the One comes into contradiction with itself and the two forces constantly vie with each other. Differences must be grounded in unity, however, as otherwise they could not be manifest at all as differences. The ground is, though, increasingly regarded as the source of the transitory nature of everything particular, and less and less as the source of tranquil insight into how we can be reconciled to finite existence.

The abandonment of his residual Spinozism leads Schelling to a growing concern with the tensions which result from contradictions which we also embody. The ages of the world are constituted by the development of forms and structures in the material and the mental world. The development depends upon the expanding force's interaction with the contracting force's slowing of any expansion, which allows transient but determinate forms to develop. This process gives rise most notably to language, which Schelling sees as the model for the development of the whole world:

> It seems universal that every creature which cannot contain itself or draw itself together in its own fullness, draws itself together outside itself, whence, for example, the elevated miracle of the formation of the word in the mouth belongs, which is a true creation of the full inside when it can no longer remain in itself.
>
> (1946: 56-7)

Language as 'contracted' material signifier, and 'expanding' ideal meaning repeats the basic structure of the *Weltalter* philosophy. This interaction between what is contained in itself and what draws something beyond itself is also what gives rise to consciousness, and thus to an inherent tension within consciousness, which can only be itself by its relation to an other. Hegel uses a related model of subjectivity, particularly in the *Phenomenology*, but Schelling later rejects this model. Schelling's later philosophy will present a subject whose origin in nature prevents it from ever achieving the 'self-presence' Hegel thinks he can explicate via the completed structure of 'self-reflection' in the other. Schelling's *Weltalter* philosophy is never completed: its Idealist aim of systematically unifying subject and object by comprehending the real development of history from the very origins of being founders on problems concerning the relationship between philosophical system and historical contingency which do not admit of solutions.

4 Positive and negative philosophy, and the critique of Hegel (*c*.1827-54)

Schelling has usually been understood to provide the transitional 'objective idealist' link between Fichte and Hegel. By regarding Hegel's system as the culmination of German Idealism this interpretation fails to do justice to Schelling's real philosophical insights. Many of these insights, particularly in the later philosophy, directly and indirectly influenced the ideas of thinkers, such as Feuerbach, Kierkegaard, Nietzsche and Heidegger, who were critical of Hegel's attempt at a complete philosophical system (see Hegelianism §2).

The differences between Hegel and Schelling derive from their respective approaches to understanding the Absolute. For Hegel the Absolute is the *result* of the self-cancellation of the finite. It can therefore be presented in the form of the successive overcoming of finite determinations, the 'negation of the negation', in a system whose end comprehends its beginning. For Hegel the result becomes known when the beginning moves from being 'in itself' to being 'for itself' at the end of the system. Schelling became publicly critical of Hegel while working on a later version of the *Weltalter* philosophy in Erlangen in the 1820s, but made his criticisms fully public in lectures given in Munich in the 1830s, and in the 1840s and 1850s as professor in Berlin. The aim of the Idealist systems was for thought to reflect what it is not - being - as really itself, even as it appears not to be itself, thereby avoiding Kant's dualism. The issue between Schelling and Hegel is whether the grounding of reason by itself is not in fact a sort of philosophical narcissism, in which reason admires its reflection in being without being able to articulate its relationship to that reflection. Schelling's essential point is that it is not the particular manifestation of knowledge which tells me the truth about the world, but rather the necessity of movement from one piece of knowledge to the next. This much can be construed in Hegelian terms. However, a logical reconstruction of the process of knowledge can, for Schelling, only be a reflection of thought by itself: the real process cannot be described in philosophy, because the cognitive ground of knowledge and the real ground, though inseparable from each other, cannot be shown to *reflect* each other.

Dieter Henrich characterizes Hegel's Absolute as follows: 'The Absolute is the finite to the extent to which the finite is nothing at all but negative relation to itself' (1982). Hegel's system depends upon showing how each limited way of conceiving of the world cannot grasp the whole, because it has an internal contradiction. This necessarily leads thought to more comprehensive ways of grasping the world, until the point is reached where there can be no more comprehensive way, because there is no longer any contradiction to give rise to it. The very fact of the limitations of empirical thought therefore becomes what gives rise to the infinite, which, in Hegel's terms, is thought that is bounded by itself and by nothing else.

Schelling accepts such a conception, to which he substantially contributed in his early philosophy, as the way to construct a 'negative' system of philosophy: it explains the logic of change, once there is a world to be explained. It does not, though, explain why there is a developing world at all, but merely reconstructs in thought the necessary structure of development. Schelling's own attempt at explaining the world's facticity led him to a 'philosophical theology' which traces the development of mythology and then of Christian revelation in his *Philosophie der Mythologie (Philosophy of Mythology)* and *Philosophie der Offenbarung (Philosophy of Revelation)*, which like all his substantial works after 1811, were not published in his lifetime. The failure of his philosophical theology does not, though, invalidate his philosophical arguments against Hegel. The alternative to the 'common mistake of every philosophy that has existed up to now' - the 'merely logical relationship of God to the world' - Schelling terms 'positive philosophy'. The 'merely logical relationship' entails reflexivity, in which the world necessarily follows from the nature of God, and God and the world are therefore the 'other of themselves'. Hegel's system removes the facticity of the world by understanding reason as the world's immanent self-articulation. Schelling insists that human reason cannot explain its *own* existence, and therefore cannot encompass itself and its other within a system of philosophy. We cannot, he maintains, make sense of the manifest world by beginning with reason, but must begin with the contingency of being and try to make sense of it with the reason which is only one aspect of it.

Schelling contends that the identity of thought and being cannot be articulated *within* thought, because this must presuppose that they are identical in a way which thought, as one side of a relation, cannot comprehend. By redefining the 'concept' such that it is always already both subject and object, Hegel's aim is to avoid any presuppositions on either the subject or the object side, allowing the system to complete itself as the 'self-determination of the concept'. Schelling presents the basic alternative as follows:

> For either the concept would have to go first, and being would have to be the consequence of the concept, which would mean it was no longer absolute being; or the concept is the consequence of being, then we must begin with being without the concept.
>
> (1842-3, 2 (3): 164)

Hegel attempts to merge concept and being by making being part of a structure of self-reflection, rather than the ground of the interrelation of subject and object. He invalidly assumes that 'essence', which is one side of the relationship between being and essence, can articulate its identity with the other side in the 'concept', because the other side is revealed as being nothing until it has entered into a relation which makes it determinate as a moment of the whole process.

The problem that Hegel does not overcome is that this identity cannot be known, because, as Schelling argues of his concept of being, 'existing is not here the consequence of the concept or of essence, but rather existence is here itself the concept and itself the essence'. The problem of reflection cannot be overcome in Hegel's manner: identifying one's reflection in a mirror as oneself (understood now as a metaphor for essence) entails, as we saw above, a prior non-reflexive moment if one is to know that the reflection *is* oneself, rather than a random reflected object. How far Schelling moves from any reflexive version of identity philosophy is evident in the following from the *Einleitung in die Philosophie der Offenbarung oder Begründung der positiven Philosophie (Introduction to the Philosophy of Revelation or Foundation of the Positive Philosophy)*:

> Our self-consciousness is not at all the consciousness of that nature which has passed through everything, it is precisely just *our* consciousness…for the consciousness of man is not = the consciousness of nature… Far from man and his activity making the world comprehensible, man himself is that which is most incomprehensible.
>
> (1842-3, 2 (3): 6-7)

Schelling refuses to allow that reason can confirm itself via its reflection in being:

> what we call the world, which is *so completely contingent* both as a whole and in its parts, cannot possibly be the impression of something which has arisen by the *necessity of reason*…it contains a *preponderant* mass of *unreason*.
>
> (1832-3: 99)

Schelling is, then, one of the first philosophers seriously to begin the destruction of the model of metaphysics

based on the idea of representation, a destruction which can be seen as one of the key aspects of modern philosophy from Heidegger to the later Wittgenstein and beyond. At the same time, he is committed, unlike some of his successors, to an account of human reason which does not assume that reason's incapacity to ground itself should lead to the abandonment of the question of truth.

List of works

Schelling, F.W.J. (1856-61) *Friedrich Wilhelm Joseph Schelling's Sämmtliche Werke*, ed. K.F.A. Schelling, Division 1 (10 vols), Division 2 (4 vols), Stuttgart: Cotta.(An easily accessible, substantial selection of the complete works has been published as *Friedrich Wilhelm Joseph von Schelling, Ausgewählte Schriften*, ed. M. Frank, Frankfurt: Suhrkamp, 1985, 6 vols.)

Schelling, F.W.J. (1946) *Die Weltalter*, ed. M. Schröter, Munich: Biederstein.(This has other versions than the version from 1813 printed in the *Sämmtliche Werke*.)

Schelling, F.W.J. (1976-) *Historisch-kritische Ausgabe, im Auftrag der Schelling-Kommission der Bayerischen Akademie der Wissenschaften*, ed. H.M. Baumgartner, W.G. Jacobs and H. Krings, Stuttgart.(This is still a long way from completion, but will become the new standard edition.)

Schelling, F.W.J. (1794) *Über die Möglichkeit einer Form der Philosophie überhaupt*, trans. and with commentary by F. Marti, On the Possibility of an Absolute Form of Philosophy, in *The Unconditional in Human Knowledge: Four early essays 1794-6*, Lewisburg, PA: Bucknell University Press, 1980.(Argues the need for an 'absolute founding proposition' in philosophy in the light of Reinhold's attempt to establish the foundations Kant had failed ultimately to provide.)

Schelling, F.W.J. (1795a) *Vom Ich als Prinzip der Philosophie oder über das Unbedingte im menschlichen Wissen*, trans. and with commentary by F. Marti, Of the I as the Principle of Philosophy or on the Unconditional in Human Knowledge, in *The Unconditional in Human Knowledge: Four early essays 1794-6*, Lewisburg, PA: Bucknell University Press, 1980.(Attempts in a mainly Fichtean manner to establish the 'unconditioned' for philosophy in the wake of Kant.)

Schelling, F.W.J. (1795b) *Philosophische Briefe über Dogmatismus und Kriticismus*, trans. and with commentary by F. Marti, Philosophical Letters on Dogmatism and Criticism, in *The Unconditional in Human Knowledge: Four early essays 1794-6*, Lewisburg, PA: Bucknell University Press, 1980.(Schelling's attempt to reconcile a Spinozist and a Fichtean account of the Absolute.)

Schelling, F.W.J. (1796-7) *Abhandlungen zur Erläuterung des Idealismus der Wissenschaftslehre (Essays in Explanation of the Idealism of the Doctrine of Science)*, in *Friedrich Wilhelm Joseph Schelling's Sämmtliche Werke*, ed. K.F.A. Schelling, Stuttgart: Cotta, 1 (1) 345-452.(Further exploration of Kantian and Fichtean questions concerning the foundation of philosophy.)

Schelling, F.W.J. (1797) *Ideen zu einer Philosophie der Natur als Einleitung in das Studium dieser Wissenschaft*, trans. E.E. Harris and P. Heath, with intro. by R. Stern, *Ideas for a Philosophy of Nature: Introduction to the Study of This Science*, Cambridge: Cambridge University Press, 1988.(First version of a system of *Naturphilosophie*, which begins to move away from Fichte.)

Schelling, F.W.J. (1799) *Erster Entwurf eines Systems der Naturphilosophie (First Plan of a System of the Philosophy of Nature)*, in *Friedrich Wilhelm Joseph Schelling's Sämmtliche Werke*, ed. K.F.A. Schelling, Stuttgart: Cotta, 1 (3) 5-268.(Further attempt to develop a systematic *Naturphilosophie*.)

Schelling, F.W.J. (1800) *System des transcendentalen Idealismus*, trans. P. Heath, with intro. by M. Vater, *System of Transcendental Idealism* Charlottesville, VA: University Press of Virginia, 1978.(Remarkably internally consistent account of the history of self-consciousness, using a model which Hegel will adopt in the *Phenomenology*. Sees art as the 'organ of philosophy'.)

Schelling, F.W.J. (1801a) *Darstellung meines Systems der Philosophie (Presentation of My System of Philosophy)*, in *Friedrich Wilhelm Joseph Schelling's Sämmtliche Werke*, ed. K.F.A. Schelling, Stuttgart: Cotta, 1 (4) 107-212.(First, clearly flawed, presentation of the 'identity philosophy'.)

Schelling, F.W.J. (1801b) *Über den wahren Begriff der Naturphilosophie und die richtige Art, ihre Probleme zu lösen (On the True Concept of the Philosophy of Nature and the Right Way to Solve its Problems)*, in *Friedrich Wilhelm Joseph Schelling's Sämmtliche Werke*, ed. K.F.A. Schelling, Stuttgart: Cotta, 1 (4) 81-103.(The text in which Schelling clearly distances his philosophy from that of Fichte for the first time.)

Schelling, F.W.J. (1802) *Bruno oder über das göttliche und natürliche Prinzip der Dinge*, trans. and with intro. by M. Vater, *Bruno, or On the Natural and the Divine Principle of Things*, Albany, NY: State University of New

York Press, 1984.(Further explorations of questions of *Naturphilosophie* and ‘identity philosophy’.)
Schelling, F.W.J. (1802-3) *Philosophie der Kunst*, trans. *The Philosophy of Art*, Minneapolis, MN: Minnesota University Press, 1989.(The first work ever to carry this title: a systematic presentation of the philosophical significance of the differing forms of art. Particularly impressive in relation to music.)
Schelling, F.W.J. (1803) *Vorlesungen über die Methode des akademischen Studiums*, trans. E.S. Morgan, ed. N. Guterman, *On University Studies*, Athens, OH: Ohio University Press, 1966.(Texts concerned with the nature of university study which relate to the foundation of new German universities at this time.)
Schelling, F.W.J. (1804a) *System der gesammten Philosophie und der Naturphilosophie insbesondere (System of the Whole of Philosophy and the Philosophy of Nature in Particular)*, in *Friedrich Wilhelm Joseph Schelling’s Sämmtliche Werke*, ed. K.F.A. Schelling, Stuttgart: Cotta, 1 (6) 133-577.(The most coherent and important version of the ‘identity philosophy’. The philosophical reflections are among Schelling’s most important: the account of *Naturphilosophie* is at times merely bizarre.)
Schelling, F.W.J. (1804b) *Philosophie und Religion (Philosophy and Religion)*, in *Friedrich Wilhelm Joseph Schelling’s Sämmtliche Werke*, ed. K.F.A. Schelling, Stuttgart: Cotta, 1 (6) 13-70.(Text in which Schelling first makes the distinction between ‘negative’ and ‘positive’ philosophy. Also signals the beginning of the move away from the Spinozist aspects of the ‘identity philosophy’.)
Schelling, F.W.J. (1806a) *Darlegung des wahren Verhältnisses der Naturphilosophie zu der verbesserten Fichteschen Lehre (Explanation of the True Relationship of the Naturphilosophie to the Improved Fichtean Doctrine)*, in *Friedrich Wilhelm Joseph Schelling’s Sämmtliche Werke*, ed. K.F.A. Schelling, Stuttgart: Cotta, 1 (7) 3-126. (Contains important formulations of the principles of identity philosophy.)
Schelling, F.W.J. (1806b) *Aphorismen zur Einleitung in die Naturphilosophie (Aphorisms as an Introduction to the Philosophy of Nature)*, in *Friedrich Wilhelm Joseph Schelling’s Sämmtliche Werke*, ed. K.F.A. Schelling, Stuttgart: Cotta, 1 (7) 140-197.(Further important development of the mature identity philosophy.)
Schelling, F.W.J. (1807) *Über das Verhältnis der bildenden Künste zur Natur (On the Relationship of the Fine Arts to Nature)*, in *Friedrich Wilhelm Joseph Schelling’s Sämmtliche Werke*, ed. K.F.A. Schelling, Stuttgart: Cotta, 1 (7) 291-329.(Further development of Schelling’s conception of art.)
Schelling, F.W.J. (1809) *Philosophische Untersuchungen über das Wesen der menschlichen Freiheit und die damit zusammenhängenden Gegenstände*, trans. and with critical notes by J. Gutmann, *Of Human Freedom*, Chicago, IL: Open Court, 1936.(The text which inaugurates a major change in Schelling’s thought, which is concerned with the question of evil and its relation to human freedom, and with God’s relationship to nature.)
Schelling, F.W.J. (1810) *Stuttgarter Privatvorlesungen (Stuttgart Private Lectures)*, in *Friedrich Wilhelm Joseph Schelling’s Sämmtliche Werke*, ed. K.F.A. Schelling, Stuttgart: Cotta, 1 (7) 419-84.(Takes up some of the themes from *Of Human Freedom*, developing them in a more systematic manner.)
Schelling, F.W.J. (1811-15) . *Die Weltalter*, trans. and with intro. and notes by F. de W. Bolman, Jr, *The Ages of the World*, New York: Columbia University Press, 1967.(Schelling’s attempt to give a metaphysical account of why the world becomes intelligible at all, and how the conflicts in reality can be grasped within philosophy. Contains vital remarks on the question of predication and identity.)
Schelling, F.W.J. (1820-1) *Initia Philosophiae Universae*, ed. H. Fuhrmans, Bonn: Bouvier, 1969. (Important text which begins Schelling’s move away from Idealist philosophy. Contains key account of the problem of ‘reflection’, which paves the way for the critique of Hegel. Contains *Ueber die Nature der Philosophie als Wissenschaft*.)
Schelling, F.W.J. (1821) *Ueber die Nature der Philosophie als Wissenschaft (On the Nature of Philosophy as a Science)*, in *Friedrich Wilhelm Joseph Schelling’s Sämmtliche Werke*, ed. K.F.A. Schelling, Stuttgart: Cotta, 1 (9) 209-46.(Also contained in *Initia Philosophiae Universae*.)
Schelling, F.W.J. (1827-8) *System der Weltalter (System of the Ages of the World)*, ed. S. Peetz, Frankfurt: Klostermann, 1990.(Development of *Die Weltalter*. Contains one of the earlier attacks on Hegel’s system.)
Schelling, F.W.J. (1830) *Einleitung in die Philosophie (Introduction to Philosophy)*, ed. W.E. Ehrhardt (Schellingiana, vol. 11), Stuttgart: Frommann-Holzboog, 1989.(Further evidence of Schelling’s move away from the Idealist paradigm towards the ‘positive philosophy’.)
Schelling, F.W.J. (1832-3) *Grundlegung der positiven Philosophie (Foundations of the Positive Philosophy)*, ed. H. Fuhrmans, Turin: Bottega d’Erasmo, 1972.(First extant systematic account of the ‘positive philosophy’, contains vital remarks against Hegel’s account of reason.)
Schelling, F.W.J. (*c*.1833-4) *Zur Geschichte der neueren Philosophie*, trans. and with intro. by A. Bowie, *On the History of Modern Philosophy*, Cambridge: Cambridge University Press, 1994.(Uniquely valuable account of the history of philosophy from Descartes to Schelling himself, covering Spinoza, Leibniz, Wolff, Kant, Fichte, Jacobi, and containing the most extensive extant critique of Hegel. A text which anticipates many of the major

themes in European philosophy after Schelling.)

Schelling, F.W.J. (1841-2) *Philosophie der Offenbarung (Philosophy of Revelation)*, ed. M. Frank, Frankfurt: Suhrkamp, 1977.(Illegally transcribed, but clearly accurate outline of the whole of the *Philosophy of Revelation*. Contains vital remarks on Hegel and positive philosophy. Excellent introduction.)

Schelling, F.W.J. (1842) *Philosophie der Mythologie (Philosophy of Mythology)*, in *Friedrich Wilhelm Joseph Schelling's Sämmtliche Werke*, ed. K.F.A. Schelling, Stuttgart: Cotta, 2 (2) 3-674.(Remarkable historical account of the emergence and development of mythology: contains important methodological reflections on the study of mythology that influenced many subsequent thinkers.)

Schelling, F.W.J. (1842-3) *Philosophie der Offenbarung (Philosophy of Revelation)*, in *Friedrich Wilhelm Joseph Schelling's Sämmtliche Werke*, ed. K.F.A. Schelling, Stuttgart: Cotta, 2 (3) 3-530.(The official version of *Philosophy of Revelation*, compiled by Schelling's son. The first ten lectures contain some of Schelling's most brilliant critical remarks on modern philosophy.)

Schelling, F.W.J. (between 1847 and 1852) *Philosophische Einleitung in die Philosophie der Mythologie oder Darstellung der reinrationalen Philosophie (Philosophical Introduction to the Philosophy of Mythology or Presentation of the Purely Rational Philosophy)*, in *Friedrich Wilhelm Joseph Schelling's Sämmtliche Werke*, ed. K.F.A. Schelling, Stuttgart: Cotta, 2 (1) 255-572.(Important further reflections on negative and positive philosophy. Contains some of Schelling's most significant remarks on ontology, particularly in relation to Aristotle and the question of being and non-being.)

Tilliette, X. (1983) *Schelling: Introduction to the System of Freedom*, New Haven, CT, and London: Yale University Press.(Good introduction to Schelling's work as a whole, which tends to focus, though, on its undoubted weaknesses, at the expense of its strengths.)

Zizek, S. (1996) *The Indivisible Remainder. An Essay on Schelling and Related Matters*, London and New York: Verso.(Very wide-ranging, fascinating, but dense and often difficult reflections on the implications of Schelling's relationship to Jacques Lacan and Hegel. Tends to underestimate the radical differences between Schelling and Hegel, but gives a very good sense of why Schelling matters to contemporary philosophy.)

Schellingianism

Schelling's philosophy, spread by German professors teaching at Russian universities and by Russians who had studied in Germany, some with Schelling himself, had an early and lasting influence in Russia. It was greatest in aesthetic theory and in the philosophy of history, but it was noticeable even in the natural sciences. Schelling appealed especially to Russians who were inclined to reconcile a modern scientific worldview with religious faith or with an exalted view of art. Particularly prominent figures were Odoevskii, Belinskii, Chaadaev, Venevitinov and Solov'ëv.

1 Schellingianism at Russian universities

Danilo Vellanskii (1774-1842), who had studied with Schelling in Germany, was a professor of the natural sciences at St Petersburg University from 1805 and published several works on medicine, biology and physics in which he faithfully followed Schelling's *Naturphilosophie* (see Naturphilosophie §2). Mikhail Pavlov (1793-1840), another student of Schelling's, was appointed professor of physics and agronomy at Moscow University in 1820. His *Outline of Physics* (1825-36) is clearly under the sway of Schelling's conception of nature. Aleksandr Galich (1783-1848), who had studied in Germany, was made a professor of philosophy at St Petersburg University in 1819. His 'Opty nauki iziashchnogo' (Essay on a Science of the Beautiful) (1825) accurately presents Schelling's aesthetics. Nikolai Nadezhdin (1804-56) won an appointment as professor of fine arts and archaeology at Moscow University in 1831, on the strength of a dissertation (in Latin) on Romantic poetry. Nadezhdin knew Schelling well and used his ideas in developing his own aesthetic theory, which features an organic conception of the social, national and historical aspects of art. The list of professors known to have taught Schellingian ideas may be readily expanded.

The student circle 'Lovers of Wisdom' in Moscow (1823-5), a secret discussion group, was led by Prince Vladimir Odoevskii (1804-69), president, and Dmitrii Venevitinov (1805-27), secretary. It had perhaps a dozen members and sympathizers, among them the Kireevskii brothers, Ivan (1806-56) and Pëtr (1808-56), both students of Schelling, Aleksei Khomiakov (1804-60), Mikhail Pogodin (1800-75) and Stepan Shevyryov (1806-64), all of whom would later become prominent Slavophiles (see Slavophilism). The circle was a hotbed of Schellingian ideas, which were launched in the publications of its members.

Odoevskii's *Russkie nochi (Russian Nights)* (published 1844, but written largely in the 1820s) has a group of young Russians gather to read their stories and discuss their ideas. Schelling's philosophy is explicity identified as the focus of these discussions. Faust, the discussion leader, presents it as a synthesis of all sciences, an inspired vision of the universe as a living organism in goal-directed flux. The power of a great artist (Bach is the case in point) is seen as in tune with the very rhythm of the cosmos. The idea that the ultimate truth, though understood intuitively, eludes rational expression, also appears as a leitmotif in *Russian Nights*. Venevitinov's essays 'Sculpture, Painting, and Music' (1827) and 'Anaxagoras: A Platonic Dialogue' (1830) are poeticized versions of Schellingian conceptions, the former being an allegoric exposition of Schelling's hierarchy of art forms, the second a poetically stylized statement of Schelling's idea that the human spirit passes from a Golden Age of instinct into freedom, as it enters history, and will return to a second Golden Age when all self-will is eliminated and pure reason reigns.

The poet Fëdor Tiutchev (1803-73) might have been among the Lovers of Wisdom, had he not joined the Russian foreign service in 1822. Like them, he later became a Slavophile. While stationed in Munich, he met Schelling and became intimately acquainted with his philosophy. A basic theme of Schelling's thought is dominant in Tiutchev's poetry: nature is an organism possessed of spirit - a cosmos; but when intuition penetrates the surface of this cosmos, it faces chaos and senses man's affinity to it, perceiving the chaos of night as the mother of all things.

A circle led by Nikolai Stankevich (1813-40) at Moscow University in the early 1830s became yet another hotbed of Schellingianism. Among its members and sympathizers were Vissarion Belinskii (1811-48), Mikhail Bakunin (1814-76), Timofei Granovskii (1813-55) and Konstantin Aksakov (1817-60), to mention the most prominent. Stankevich and several members of his circle abandoned Schelling for Hegel around 1838 (see Hegelianism, Russian).

2 Schellingian aesthetics

Schelling's organic aesthetics dominated Russian literary criticism mainly as a result of Belinskii's pervasive influence. Belinskii, a student of Nadezhdin's, turned Hegelian after 1838, but the principles of Schelling's romantic aesthetics were retained by some of his followers, particularly Apollon Grigor'ev (1822-64), who in turn influenced Dostoevskii and even the Symbolists at the turn of the century. These principles were: true art is not *mimesis* but a creative extension of nature; it is inherently symbolic and has cognitive power, expressing the universal through the particular, the ideal through the real, and the eternal through the temporal; it is free, yet it necessarily expresses the truth of life; it is in phase with history, creating the mythology by which nations and societies live. Grigor'ev, who called his method 'organic criticism', defined historical sense as 'an understanding of the organic nature of history, a recognition of eternal, absolute ideals, the presence of which gives meaning to history' ([1858] 1876: 223). He denounced the Hegelian 'historical school' for seeing only the progress of history, rather than the absolute and lasting values created by each stage of the historical process.

3 Schellingian philosophies of history

While the Left of Russian thought followed Hegel and the Left Hegelians once they had become known in Russia, the Right stayed with a Schellingian philosophy of history, essentially in an effort to retain religion as a foundation of national life. This is true of Pëtr Chaadaev (1794-1856), the first prominent Westernizer. Chaadaev met Schelling in Germany and corresponded with him. He was the first Russian to believe that humankind would enter the millennium through the gates of history, seen as a movement generated by a striving for unity, perfection and universality. Unlike Schelling, he saw Christian religion not as a mere stage of this process, but as its sole generating power.

Slavophiles, specifically Khomiakov and Ivan Kireevskii, and the *pochvenniki* (from *pochva*, 'soil', Schelling's *Boden*) Grigor'ev and Dostoevskii shared Schelling's organic conception of nationhood and saw the historical process in terms of revealed absolute ethical values undergoing temporal metamorphoses through a dialectic of resolved contradictions. The Slavophiles, in particular, stressed the primacy of revealed religion: in a dialectic of material and spiritual values, the burden was on science to raise itself to the level of religion, not vice versa.

Khomiakov perceived history as a dialectic process whose opposite poles are 'Iranian' humanity, guided by ideal (spiritual and aesthetic) values and its 'Kushite' antipodes, guided by material aspirations of power and possessions. Christianity, the culmination of Iranian humanity, amounts to the realization of the idea that man is so godlike - in a spiritual sense - that God could become man: we have a capacity for infinite perfection, which gives us infinite freedom.

Lev Shestov said of Vladimir Solov'ëv (1853-1900), Russia's leading academic philosopher, that 'Schelling so permeated him that he apparently lost his ability to distinguish himself from him' (1964: 38). In particular, it was Schelling's *Philosophy of Revelation* that appealed to Solov'ëv, who also followed Schelling in incorporating Jakob Boehme's mystic doctrines into his system. Solov'ëv's first work was pure Schelling: *'The Mythological Process in the Paganism of Antiquity'* (1873) sees history as a mythmaking and theogonic process. Solov'ëv's conception of history is that of a complex, living, personal God, realizing himself through a process of overcoming what is alien to him: chaos, disorder, evil. In his *Opravdanie dobra (Justification of the Good)* (1897), Solov'ëv followed Schelling in dealing with the problem of evil: God denies evil as final or everlasting, but allows it to exist as a passing condition of freedom. The nature of man is one of divine potential. Once the process of divine revelation is completed, evil will become unreal. Solov'ëv also followed Schelling in presenting his historical insights in terms of dialectic potencies. In an essay of 1877, 'Three Powers', the inhuman God of the East is countered by godless man of Western capitalist society, with a synthesis of godly man produced by a union of East and West.

Schellingian ideas appear massively in the writings of Solov'ëv's followers, such as Sergei Trubetskoi (1862-1905), Viacheslav Ivanov (1866-1949), and Nikolai Berdiaev (1874-1948).

Schiller, Ferdinand Canning Scott (1864-1937)

F.C.S. Schiller was the outstanding exponent of pragmatism in Britain. His views, which he referred to at various times as humanism, voluntarism and personalism, as well as pragmatism, were strongly influenced by William James, to whom he paid great tribute, although he claimed to have arrived at his opinions independently. Schiller pursued the subjective and personal aspects of James's psychology, whereas Dewey built on its objective and social elements. In taking the process of knowing as central to reality, Schiller was also influenced by Hegel. Schiller's philosophy may be best approached in terms of his opposition to the absolute idealism of the then-dominant British Hegelians (particularly F.H. Bradley, his bête noire*); Schiller thought their monism, rationalism, authoritarianism and intellectualism denied the basic insight of Protagoras that it is man who is the measure of all things.*

Schiller was born in Schleswig-Holstein and studied at Oxford, where he gained an MA. In 1893 he went to Cornell as a graduate student and instructor. He left there without a doctorate, however, to go to Corpus Christi College, Oxford, where he became senior tutor and fellow. He received the D.Sc. degree in 1906, as well as other academic honours. In 1926 he began to spend part of each year at the University of Southern California, and moved there permanently in 1935 as professor.

Schiller argued that all acts and thoughts are irreducibly the products of human beings, and are therefore inescapably associated with the needs, desires and purposes of the individual actor or thinker. Such concepts as 'reality' and 'truth' do not denote independent and absolute entities; they are permeated by human intentions and activities. The absolute idealists maintained that 'reality' is a seamless logical unity in which all separateness vanishes, and that nothing finite, transitory or changeable is quite real. But, Schiller pointed out, all that exists for us are the bits of matter we encounter, the individual acts we perform and the private thoughts we think. Reality for us is indeed piecemeal, incomplete and plastic. The reality revealed by our active inquiries is not rigid but malleable, not complete but evolving, responsive to our probing and manipulating, and therefore to our needs and purposes. What we call 'real' is what we evaluate as important. It is the result of the kind of activity by which we reduce the chaos about us to order. To be sure, there are patent limits to human powers, and the world obviously preceded our existence; Schiller later reluctantly accepted the distinction between 'making' the real and 'finding' it, but he reiterated the meaninglessness of the 'real-as-it-is-in-itself'. He used the Greek term '*hyle*' to refer to the indeterminate formless chaos beyond our ability to perceive or manipulate. His metaphysics can thus accommodate Darwinian evolution and the emergence of genuine novelty (always a problem for the absolute idealist). It is a firm foundation for human freedom, and legitimizes human progress. Metaphysical systems reflect personality and temperament, and are thus quasi-ethical, or even aesthetic, in character.

Schiller's doctrine of truth likewise raised British philosophical hackles. The truth of a proposition can be determined only by what follows from it in the court of experience. Truth is a valuation applied as the result of a procedure called verifying, or making true. Since no verifying can establish the absolute truth of a statement, Schiller held that truth is particular, personal and progressive. That which furthers the purpose of our inquiries we call true. 'Truth is that manipulation of [objects] which turns out upon trial to be useful, primarily for any human end, but ultimately for that perfect harmony of our whole life which forms our final aspiration'. Of course it is fallacious to infer 'the useful is true' from 'the true is useful' - all sorts of statements (political propaganda, advertising, outright lies, for example) can be useful, though clearly false. Schiller distinguished seven levels of truth claims. Thus a postulate is a statement which becomes an axiom if it is fully verified, 'serves as principle for a fully established science' and 'rests securely on the solid mass of scientific fact it has been instrumental in eliciting'. There are also methodological assumptions (for instance, determinism) and methodological fictions (for instance, the use of plane geometry in cartography).

Schiller accused traditional formal logic of having 'etherealized' and 'depersonalized' truth in its search for validity. It had become a word game, with no concern for actual thinking processes, or for meaning and context. In two books, *Formal Logic* (1912) and *Logic for Use* (1929), Schiller showed that formal logic, even on its own terms, was not free from ambiguity - how can there be anything in the conclusion of a syllogism not contained in its premises? What is the precise import of the copula in a proposition? How can logic consistently appeal to such

psychological notions as the 'necessity' of implication or the 'self-evidence' of axioms? Schiller urged that logic should become a systematic evaluation of actual knowing. His resolute experimentalism led him to claim in 'Axioms as Postulates' (1902) that even the basic Aristotelian principles of identity, contradiction and excluded middle were postulates. He also argued that the 'facts' of the scientist are relative to our senses, memory, language, instruments, aims and hypotheses.

Schiller carried his pragmatism into ethics, social policy (he was a great advocate of eugenics) and religion. He shared with William James and Henri Bergson an interest in psychical research, and translated James's 'will to believe' into the 'right to postulate'. Schiller was a prolific writer, a sprightly stylist and a spirited polemicist; he rather enjoyed being an *enfant terrible*. He produced a parody of that stately establishment journal *Mind* (which he called *Mind!*), an example of that scarce commodity, philosophical humour.

Schiller, Johann Christoph Friedrich (1759-1805)

Schiller was an artist first - a major poet and the leading dramatist of eighteenth-century Germany - and an aesthetician second. At the height of his involvement in aesthetics, he calls the philosopher 'a caricature' beside 'the poet, the only true human being'. But reflection had deep roots in his nature, to the point where he felt it inhibited his creativity, yet would also have to be the means to restore it. He eventually came to terms with this paradox by devising a typology of 'naïve' and 'reflective' artists that explained his problem - and incidentally the evolution of modern European literature (On Naïve and Reflective Poetry, 1796). Schiller was also driven by a passionate belief in the humanizing and social function of art. His early speech The Effect of Theatre on the People (1784; later title The Stage considered as a Moral Institution) celebrated the one meeting-place where our full humanity could be restored. In the mature essays of the 1790s, an immensely more complex argument cannot hide the ultimate simplicity of his faith in art, even and especially in the midst of historical crisis: his culminating statement on beauty, On the Aesthetic Education of Man (1795) is at the same time a considered response to events in France, where a 'rational' Revolution had turned into a Reign of Terror. Schiller proposes an education for humane balance as the only sufficiently radical answer to the violent excesses of impulse, and argues that art is its only possible agent. Schiller's ideas are imaginative, generous and intuitively appealing as an account of what art is and might do. With the authority of his poetic standing and the high eloquence of his prose, they are powerful cultural criticism. Arguably they could have been more effective still and less vulnerable if he had not tried to make them something else by giving them a systematic quasi-Kantian form, as a result of which philosophical commentators have often patronized him while the Common Reader has been scared off.

1 Life

Schiller was born at Marbach in Württemberg. At fourteen he was placed in the Duke of Württemberg's military academy against the wishes of his parents, and made to study medicine against his own. Apart from an occasional autopsy and some observations of melancholia in a fellow-student, 'medicine' largely meant philosophical speculation on the workings of mind and body.Schiller was fascinated by the problem of mind-body interaction which was to remain central to his aesthetics. His 'medical' dissertations emphasize the effect and value of the physical component, true to the pattern of German eighteenth-century aesthetics which upgrades sense experience and alters the priorities of rationalism. Frustrated by a lowly post as regimental doctor and a ducal prohibition on writing any more drama after his sensational début *The Robbers* (1782),Schiller fled from Württemberg into the dubious freedom of a hand-to-mouth existence. There followed years of editing journals and writing pot-boiler fiction and popular history, necessary means of survival but obstacles to his higher ambition. In 1789 he was appointed Professor at the University of Jena, lecturing on history and aesthetics: a post that brought prestige but little pay. He only became relatively free of financial pressures in the very last years before his premature death. By then at least his fame was secure as poet, dramatist and critic and (from 1794 on) the literary partner and acknowledged equal of Johann Wolfgang Goethe in what came to be known as Weimar Classicism.

2 First essays: the sublime and tragedy

Schiller's first work in aesthetics proper is avowedly derivative from Kant's account of the sublime, except that Schiller takes over this standard eighteenth-century concept as the basis of his definition and practice of tragedy (see Kant, I.). Burke in 1757 had already suggested that sublime objects - towering crags, desert wastes and the like - 'exercise the finer parts of the system' in a virtually physiological way. By 1790 Kant is explaining the pleasures of sublime phenomena by an intricate psychological-cum-moral sequence in which their threat to overwhelm us forces us back on our distinctively human rational nature. By now, too, human actions such as principled self-sacrifice have crept in among the sublimities. The proximity to tragedy is obvious. Schiller locates tragedy in the necessary assertion of 'moral being' (*Sittlichkeit*) in the face of threats from or to the agent's 'sensuous being' (*Sinnlichkeit*). This may seem a reaffirmation of rationalist moral values, but for Schiller 'sensuous being' is not so readily abandoned as in earlier heroic and Christian drama. The pleasure of tragedy is not the simple one of moral triumph at the rejection of something worthless, but the poignant mixed feeling at the necessary sacrifice of something intensely valuable. In his last essay on the sublime (probably late 1790s), the tragic vision has been intensified by European wars, and the primacy of the stoic moral will is even more in the foreground. Yet tragedy still only treats the harsher aspect of life, is only one literary genre, and not for Schiller

the highest. This rank he gives to the genre he never worked in, comedy, because of its final harmony and balance.Schiller was the last writer to make significant use of the sublime in its traditional sense before it expired with the century, to be reassumed into a single larger conception of beauty (although the concept recurs with a different function in Hegel's *Aesthetics* and is resurrected in twentieth-century theories of 'Post-Modernism').

3 Beauty and aesthetic experience

On this central theme,Schiller once again starts from Kant, and after following some false trails goes well beyond him. In particular he does fuller justice to the complexity of both the aesthetic object and its reception. Both aspects bear out Schiller's aperçu that it was crucial for a theory of art that the thinker should be a practising artist. Kant's principle that aesthetic experience consisted in 'pleasure without interest' had set the object apart from practical purposes like use or desire, to be dwelt on for its own sake; while the effect of the pure form-percept lay in its power to seem nevertheless mysteriously purposive. This is conventionally seen as a philosophical breakthrough, but it only codified what contemporary writers were already perceiving and demanding in their practice, namely that the work of art and its constituent elements must be free of the constraints, moral, political or religious, placed on utterances in the practical world, and that it had formal laws of its own. Art was a distinct realm of contemplation and representation where the writ of authority did not, or at least should not, run - a recognizable off-shoot of the central Enlightenment principle of independent thought and free public communication. This is not of course to explain away in social terms the new insight that art is a means to hold external demands in suspense while life is inspected with a fresh eye and reshaped by the imagination. To all this, Schiller the writer was deeply committed.

For Kant, however, aesthetic judgment and the very attribution of aesthetic status were subjective, resting on an adjustment of the observer's mode of seeing. This leftSchiller dissatisfied. Was there nothing in the constitution of the object that positively invited such a mode of seeing - more compellingly than Kant's example of the arabesque, which inspired no 'interest' the observer would need to disregard and could thus, by a too simple logic, actually rank higher in beauty than the human form? An equally dubious logic had established Kant's next step. If observers all abstracted from their personal 'interests', then what was left must be common ground, for they had categorically lost the wherewithal to disagree. Ergo, aesthetic judgments were universal. But this was to reduce the beholder to a pure Nobody, emptying both subject and object of the reality that must surely be present - transformed, yes, but not purified out of existence - if art is to matter to anybody.

4 The *Kallias* Letters

Kant's limitations set Schiller's programme. In the never-completed project *Kallias*, sketched in 1793, he tried to establish an objective (but not empirically dependent) definition of beauty. He begins in Kantian spirit by calling it the 'form of a form', that is, a pure percept which is, as it were, permitted by the functional form of objects. (In line with much eighteenth-century aesthetics, he has natural objects in mind at least as much as artefacts.) But where for Kant it was the observer who disregarded purpose, for Schiller the object has itself 'overcome' its purpose, to appear free. Hence beauty is 'freedom in the phenomenon' or 'in appearance'. Though the German *Erscheinung* does not mean 'mere' or 'illusory appearance', Schiller cannot get round the fact that his freedom *is* merely in the eye of the beholder, or even just a metaphor for beauty's effect. Nor is there, incidentally, any clear reason why aesthetic pleasure should stem from the sight of freedom, other than that it offers 'an analogy with the form of the pure will', and that Schiller is avowedly one of those 'for whom freedom is the highest principle'. His fall-back position - that beauty comes about when nothing in the phenomenon too obviously *belies* the appearance of freedom - remains just as open to his friend Körner's objection that the whole theory rested on 'the autonomy which the observer mentally adds to the phenomenon', that is, it was irretrievably subjective.

5 *Grace and Dignity* (1793)

But instead of pursuing this central problem with a changed approach, Schiller keeps his flawed approach and changes the problem, to a secondary one which promised to fit it better. He defines grace as 'beauty in motion': motion at least was objective. Yet, lacking a satisfactory definition of the beauty to be observed in motion, he was (as he admitted) trying to fly before he could walk. 'Grace' moreover, when further unpacked, turned out to depend on the same criterion that had given trouble in *Kallias*: it was 'the beauty of the [human] form [*Gestalt*] under the influence of freedom'. Admittedly freedom in human beings, even if problematic in other ways, is not in

doubt as an illusion of the beholder. And it soon becomes clear thatSchiller is attempting an aesthetics not just of physical movement *per se*, but of total modes of behaviour in real situations. This might seem to cross the border from aesthetics into ethics altogether.Schiller distinguishes two basic responses to two equally basic types of situation. When human impulses are in harmony with each other and not under pressure from the surrounding world, the agent can freely choose how to act, and as an unconscious effect (Schiller constructs careful provisos against its conscious pursuit) grace may result. In contrast, when the impulses are at war with each other or under attack from the world, so that only a stoic defence is left, dignity may result. The first case shows freedom *in*, the second freedom *from* nature, where 'nature' is both the system of inner purposes that constitute our organic form, and the nexus of outer constraints that shape our lives.Schiller also posits a character type - the 'beautiful soul' or 'fine mind' (*schöne Seele*) - whose serene inner nature entails grace as a constant attribute. Yet even this ideal type cannot be immune to life's tribulations. In adversity, the harmony of mind and body has to be replaced by the freedom of mind *from* body, the 'sublime' quality of dignity. The links with Schiller's theory of tragedy are plain, as is the implication that the *schöne Seele* would be in its literary element as the hero or heroine of comedy or idyll.

The direct claims of morality that had been expelled from eighteenth-century aesthetics seem at first sight to have got in again. Schiller however is asserting a value higher than mere ethical outcomes. This emerges clearly in his discreet rebellion against the moral authority of Kant. If, as Kant had argued, an action can only be accounted moral when duty is kept sharply distinct from inclination, and indeed has normally had to overcome inclination, then there can be no such thing as an inherently moral being. Surely, Schiller argues, the ideal should be an *inclination to* duty? Only then would virtue be a value we embrace with our whole self, and no longer merely an external requirement that we obey in an endlessly repeated struggle with ourselves. Schiller concedes that Kant's rigorism may have been a necessary prescription for their age. But the highest moral norm should surely not be set by emergency; it must lie in the kind of primal spontaneity of action that defines the *schöne Seele*. Kant'sfootnote to the second edition of *Religion within the Bounds of Mere Reason*, acknowledging Schiller's 'masterly treatise', is a response but hardly an answer. Schiller, diplomatically, hastened to declare himself satisfied. Yet his conception remains a significant challenge toKant's axiom of pessimistic dualism. It is an appeal to balance spirit with sense, and moral with aesthetic judgment.

6 *Letters on the Aesthetic Education of Man* (1795)

Balancing opposed elements is the central idea of Schiller's major essay. It is the key both to understanding the nature of beauty and to creating a stable free society in some future age. These disparate aims make an unlikely pair, but to Schiller art seemed to offer precisely what the politics of the 1790s cried out for. Imbalance was the common condition in a world already suffering from division of labour. HereSchiller prepares the ground for Hegel and Marx on alienation, drawing a familiar eighteenth-century contrast with the wholeness of the human individual that was possible in Ancient Greece (L6). The added stress of revolutionary upheaval in France had now produced internecine violence. The French had acted with the ruthless rationality of 'barbarians' untouched by feeling, or the crude sensuousness of 'savages' unchecked by spirit (L4), an analysis that incidentally echoes the comments of observers in Paris. The project of an ideal society had failed not through the use of reason to guide reform, as conservatives like Burke held, but through its unmediated use by the unreformed. A force was needed that would smooth and stabilize the transition from sense to reason, exercising the human agent as both sensuous and rational being and strengthening or moderating each element as needed. That, according to Schiller's philosophical poem 'The Artists', was the role beauty had played in human evolution, and it could be repeated now. Art was the only force potentially free from the vicious circle of unregenerate humanity and the society that resulted. Art's highest exemplars fused substance and form and thus could balance and integrate sense and spirit in the beholder. The structural correspondence is clear. Less clear is how art might get a purchase on political reality. Schiller however is not offering a plaster for present ills, but a means to stop them recurring in the long term and so to create a new civic starting-point. There is no question of art's relapsing into didacticism to achieve this. Its effect for any specific purpose is avowedly 'nil'. Yet precisely by nullifying all previous determinations, its effect is 'infinite' because that restores human beings to themselves and sets them free once more to be - 'what they are meant to be' (L21). This is the still undaunted Enlightenment or Rousseauian faith that a new start will necessarily be a start in the right direction. The more pessimistic view, that our only realistic course is to practise a stoic rationality since life will always be crisis, is left for that tailpiece on the sublime (see §2 above) which in a sense

completes the programme of aesthetic education.

We are again at frontiers, with ethics, politics, social anthropology. To get there has required new solutions in aesthetics, and it was the pressure of an urgent problem in those areas that droveSchiller to find them. After sketching the crisis and arguing that art alone can help (L1-9), he has analysed human makeup into ‘person’ and ‘condition’, the core identity and its changing determinations (L10); and identified two matching drives, a sensuous impulse (*Stofftrieb*) towards realization and involvement in the material world, and a formal impulse (*Formtrieb*) towards moral and intellectual control (L12). These elements are only separable in the abstract; we actually experience them in their various interactions and imbalances. The ideal fulfilment of our dual nature would be to assimilate a maximum of reality but with a maximum of formal coherence. Such a state would bring into being a third drive, the play impulse (*Spieltrieb*), whose concrete object would be a fusion: the material world, or in its broadest sense ‘life’ (*Leben*), would join with formal structure or ‘shape’ (*Gestalt*) to produce ‘living shape’ (*lebende Gestalt*) (L15). More important surely for art’s role as a sociopolitical remedy, thoughSchiller does not say this, would be the reverse sequence: once aesthetic play was in some measure achieved, the two original impulses would be brought into some kind of balance. ‘Living shape’ meantime becomes Schiller’s definition of beauty, and ‘play’ his account of aesthetic experience. Although he proposes the aesthetic state as the long-term answer to a political problem, in the still longer term he intends it to be self-sufficient. It can be borrowed to meet a need, but is ultimately an ideal (L27). For ‘human beings only play when they are human in the fullest sense of the word, and they are only fully human when they play’ (L15). The language of the *Letters*, incidentally, enacts the complexities of opposition and reconciliation in a play of its own with a rich and at first confusing array of concepts, all of them however variations on an underlying pattern. Readers will find the game is better played fast for its form than slowly for its detailed content.

Leaving the political application aside, the *Letters* are a great advance on earlier aesthetics, bothSchiller’s own and Kant’s. No longer is an ‘objective’ theory insisted on, though there are vestiges of it in the original draft of Letter 1. Instead, both the constitution and the effect of beauty are grounded in the psycho-physical constitution and needs of human beings. Whereas Kantian ‘disinterestedness’ was a passive state that denied individuality, ‘play’ is an activity that subtly redeploys it. People bring to aesthetic encounters not an ‘empty indeterminateness’ but their whole past experience in a state of ‘active determinability’ (L20ff). This ensures, not a depersonalized universality of aesthetic judgment as in Kant, but a deeply personal response to both the forms and the substance of art. It restores reality to the abstractions of aesthetics: a landscape painting works with our accumulated experience of landscapes, a statue of Venus provokes more than an appreciation of assorted arabesques. The notion of ‘play’ means we take things seriously but not solemnly, in and for themselves, in an act of contemplation and savouring. In Brecht’s deceptively simple words, ‘In art, people enjoy life’. Such enjoyment involves separating ‘appearance’ - *Schein* this time, the standard word for illusion - from reality (L26). But it clearly no longer bothersSchiller that this makes his theory a subjective one. It has strong enough roots in the individual experience art springs from and appeals to, while ‘play’ is universal not as a logical abstraction but as an anthropological phenomenon.

7 *On Naïve and Reflective Poetry* (1796)

Schiller’s final large-scale essay is not so much aesthetic theory as literary and cultural history, with sections of brilliant practical criticism. In the wake of long-running European debates on the relative merits of Ancients and Moderns, it traces a movement from the Greeks’ oneness with the natural world to the hyperconsciousness of post-Christian Europe where, except for a few outstanding cases like Shakespeare, Molière and now Goethe, reflection necessarily intrudes between the poet and the object. Modern writing is constituted by reflection’s many forms, but their underlying constant, and hence the deepest shaping influence on European literature, is an elegiac sense of lost harmony. To restore that harmony and the perfection of artistic form that went with it in antiquity, while managing somehow still to retain the riches of the modern sensibility - a postmodernism of serious substance - is the near-impossible millennial goal. But Schiller was never short on aspiration.

Schlegel, Friedrich von (1772-1829)

Schlegel was the major aesthetician of the Romantic movement in Germany during its first formative period (1797-1802). In these years he developed his influential concepts of Romantic poetry and irony, created an original approach to literary criticism and edited the journal of the early Romantic circle, Athenäum. Along withF. von Hardenberg (Novalis),F.W.J. Schelling andF.D.E. Schleiermacher, he was also a guiding spirit in the development of a Romantic metaphysics, ethics and politics. His metaphysics attempted to synthesizeFichte's idealism and Spinoza's naturalism. His ethics preached radical individualism and love against the abstract formalism ofKant's ethics. In his early politics Schlegel was very radical, defending the right of revolution and democracy against Kant. In his later years, however, he became much more conservative. His final works are a defence of his neo-Catholic mysticism.

Schlegel began his intellectual career as a classical scholar. His *Über das Studium der Griechischen Poesie (On the Study of Greek Poetry)* (1797) attempted to write a history of Greek poetry and formulate a neoclassical aesthetics. Schlegel wanted to do for the history of Greek poetry what J.J. Winckelmann had done for the history of Greek sculpture. Like Winckelmann, Schlegel admired the ancient Greeks for attaining a purely 'objective' norm of beauty, which was independent of national taste, personal caprice or even moral and political ends. He criticized modern literature because, rather than observing such a norm, it pandered to national taste with novel and striking gimmicks. Schlegel believed that the artist should attempt to imitate the purity and simplicity of classical models; in the recent works of Goethe he saw promising signs of a new classicism in Europe.

However, as early as 1797, largely under the influence of Friedrich Schiller, Schlegel began to have doubts about his neoclassicism. He now started to appreciate some of the distinctive values of modern Christian culture, especially its ideal of the infinite, its ethic of love and its emphasis upon personal freedom. In his *Athenäums Fragmente* (1798) Schlegel then gave a condensed account of his new Romantic aesthetic. The aim of the Romantic artist is to express the characteristic feature of modern culture: the striving for the infinite, the longing for the kingdom of God on earth, the struggle to realize Kant's ideal of the highest good (see Kant, I. §11). What is distinctive of Romantic art in contrast to classical, Schlegel wrote in his *Gespräch über Poesie (Conversation on Poetry)* (1800a), is that it expresses sentiment, especially the feeling of love, which is the longing to realize the infinite. In attempting to express such a grand ideal, the Romantic artist should attempt to cultivate irony, a critical detachment towards his own productions, for any of them are limited and therefore inadequate to express his unlimited ideal.

In several essays of the late 1790s, 'Über Lessing', 'Georg Forster' and 'Jacobis Woldemar', Schlegel developed a new method of literary criticism, which he described as 'characterization' (*Charackteristik*). The aim of this method was to understand a work as a unique whole, to reconstruct an author's characteristic style. Rather than criticize a work according to some norm of objective beauty,Schlegel insisted upon evaluating it according to its own aims and upon exposing its inconsistencies. This internal approach to a work was, according to Wilhelm Dilthey, an important step in the development of hermeneutics (see Hermeneutics).

It was also in the late 1790s that Schlegel made his most important contributions to the ethics and politics of Romanticism. His 'Versuch über den Begriff des Republikanismus' ('Essay on the Concept of Republicanism') (1796 (1996)), one of the most radical writings of the 1790s in Germany, was a defence of the right of revolution and direct democracy against Kant. His *Athenäums Fragmente* (1798-1800) and *Lucinde* (1799) were also far ahead of their time in championing such progressive causes as sexual liberation and the emancipation of women. Along with Schleiermacher, Schlegel developed an ethic of love and individuality in reaction to the abstract formalism of Kant's ethics (see Kantian ethics). He maintained that love cannot be understood as a legal obligation, and that it should involve a sensualization of the spirit as much as a spiritualization of the senses.

Schlegel's contribution to the metaphysics of Romanticism is his *Vorlesungen über die Transzendentalphilosophie (Lectures on Transcendental Philosophy)*, delivered as lectures in Jena in 1800. This work is an attempt, several years before Hegel, to develop a synthesis of naturalism and idealism, of Spinoza and Fichte. While Schlegel argued that Kant and Fichte had wrongly separated the self from nature and history, he also criticized Spinoza for his static and ahistorical conception of the divine substance.

In the early 1800s the flame of Schlegel's early radicalism dimmed and his thought moved steadily in a conservative direction. He became disillusioned with the French Revolution, which seemed to end in anarchy, commercialism and military dictatorship. Increasingly, he saw the defence of the Catholic Church and the old social hierarchy as the only safeguards against these disturbing trends, and as the only pillars of spiritual and communal values. His growing conservatism culminated in his conversion to the Roman Catholic Church in 1808 and in his diplomatic and literary activity on behalf of Metternich between 1809 and 1818. In his later political writings, especially his *Signatur des Zeitalters (Sign of the Age)* (1820), Schlegel defended a virtually reactionary position: that the basis of all right is tradition, that society should be organized according to estates, and that social order depends upon the restoration of the Church.

His later works are mainly an apology for his neo-Catholic mysticism. His Philosophie des Lebens (Philosophy of Life) (1828) taught that the aim of philosophy should be to develop the spiritual life of a person, their receptivity for a divine revelation. His *Philosophie der Geschichte (Philosophy of History)* (1829) held that world history is not a progression towards greater rationality, but an attempt to return to spiritual grace and harmony with the divine. Although this work does give great importance to non-Western cultures, Schlegel still sees European Christianity as the turning point of history and the culmination of civilization.

Schleiermacher, Friedrich Daniel Ernst (1768-1834)

Friedrich Daniel Ernst Schleiermacher was the most notable German-speaking protestant theologian of the nineteenth century. He gave significant impetus to the re-orientation of theology after the Age of Enlightenment (see his speeches Über die Religion (On Religion) (1799), and also Kurze Darstellung des theologischen Studiums (Brief Outline of Theology as a Field of Study) (1811a)) and he enjoyed a wide audience in Berlin both as preacher and Professor of Theology and Philosophy. Throughout his life he was a fervent advocate of the union between the Lutheran and the Reformed Church established in the so-called Old Prussian Union, and his compendium Der christliche Glaube (The Christian Faith) (1821, 1822) is held to be the first dogmatics transcending the denominational boundaries between the Reformation Churches. His translation ofPlato attained the status of a classic. In his university lectures and academic speeches on philosophy he made a profound and lasting impression on his audience, both in his historical and systematic thought. He also had an important hand in the reform of the German Universities. In theology and philosophy he strove to find an independent and intermediate position between the Enlightenment, German Idealism and Romanticism.

1 Life

Schleiermacher was born on 21 November 1768 in Breslau, the second child and eldest son of the Reformed Church chaplain Johann Gottlieb Adolph Schleyermacher and his first wife Elisabeth Maria Katharina Schleyermacher (born Stubenrauch). After a childhood spent in Breslau, Pless and Anhalt (Upper Silesia), Schleiermacher was educated among the Moravians (Herrnhuter Brüdergemeine), a small Lutheran community established by Zinzendorf in 1727. He was a pupil at the *Pädagogium* (grammar school) in Niesky and then went to the *Seminarium* (college) in Barby. After leaving the Moravians, he studied theology and philosophy at the Friedrichs-Universität in Halle an der Saale from 1787 to 1789. From Johann August Eberhard he gained familiarity with ancient and contemporary philosophy. Schleiermacher sought to find his own position within the intellectual dialogue that was being conducted between the Leibniz-Wolff school and Kant's critical philosophy, which had begun to gain ascendency in Germany. He passed his first Church examination in 1790 and took a post in Schlobitten, East Prussia, as tutor to the family of Count Dohna. After successfully negotiating his second Church examination in 1794, he became a preacher in the Reformed Church, initially at Landsberg an der Warthe; then, from 1796 to 1802, at the Charité hospital in Berlin and eventually at Stolp in Pomerania. In 1804 he was appointed Professor of Reformed Theology in Halle an der Saale, but after the Prussian defeat at the hands of the French and the truce at Tilsit in 1807, he moved back to Berlin. He participated in the literary discussion concerning the reform of the university, the subject of his *Gelegentliche Gedanken über Universitäten in deutschem Sinn (Occasional Thoughts on Universities in the German Sense)* (1808a). In 1809 he married the widow of a friend, Henriette von Willich (born von Mühlenfels), and took up the pastorate of the Reformed Church at the Dreifaltigkeitskirche in Berlin. In the following year Schleiermacher also became Professor of Theology at the newly founded Friedrich-Wilhelms-Universität, and a member of the philosophical section in the Royal Academy of Sciences in Berlin. In this capacity he gave lectures both in theology and philosophy at the university. As secretary of the philosophical section from 1814 and, from 1826, also secretary of the section in history and philology, he undertook the reorganization of the Academy, becoming secretary of the historical-philosophical section in 1827. While Schleiermacher worked actively in the Prussian reform movement after 1807, participating officially in educational reform from 1810-14, he took a stance in opposition to the government during the Restoration era. He continued his official ecclesiastic and academic duties in Berlin until his death on 12 February 1834.

2 Philosophical work

Schleiermacher's main philosophical interest was in the field of ethics. As a member of the Berlin circle of Early Romantics he anonymously published several small essays on ethical themes in the *Athenaeum* journal of the Schlegel brothers (1798-1800) (see Schlegel, F.). His poetical early writings were in part dedicated to the exposition of his ethical views: *Monologen. Eine Neujahrsgabe (Soliloquies)* (1800a) as the manifesto of an individualist ethics, and his *Vertraute Briefe über Friedrich Schlegel's Lucinde (Letters concerning Friedrich Schlegel's Lucinde)* (1800b) as the Romantic interpretation of erotic love. His first systematic work was *Grundlinien einer Kritik der bisherigen Sittenlehre (Principles of a Critique of all Doctrines of Ethics Hitherto)*

(1803), which was a critical examination of ethical systems from Antiquity to Kant (§§9-11) and Fichte (§6). Schleiermacher laid the plans for his own exposition of ethics in his lectures, but never published them. Instead he published detailed ethical investigations in the course of his academic treatises (1819-30). Areas to which he directed much philosophical attention were his research into the history of philosophy (for instance, *Herakleitos* (1808b)) and to his translation of Plato's works (1804-28). However,Schleiermacher also undertook comprehensive systematic studies in the course of his lecturing career and it is here that he made his seminal contribution to hermeneutics, pedagogics and psychology. He never managed to work out his rich and diverse lectures on different philosophical disciplines for publication; his philosophical system has to be reconstructed from the relevant posthumously published manuscripts and his students' notes of his lectures.

3 The system of sciences

Schleiermacher's system follows the ancient division of philosophy into dialectics, physics and ethics. His idea of philosophy is the perfection of knowledge in the mutual interpenetration of six basic sciences (*Grundwissenschaften*), four with regard to the material aspects of knowledge and two to the formal. He structures the system of material sciences with the help of the dual opposition between reason and nature on the one hand and essence and existence on the other. The sciences of nature and reason, which differ with respect to their objects, fall under the modal distinction of the speculative and the empirical. The science of nature and the science of reason are thus subdivided into a speculative science of the essence of nature and reason respectively and into an experiential science of the appearance of nature and reason respectively. Schleiermacher calls these four material sciences 'physics' and 'the study of nature' (*Naturkunde*), 'ethics' and 'the study of history' (*Geschichtskunde*). The formal sciences are dialectics and mathematics. Dialectics is the supreme science, which replicates the supreme knowledge formally, just as mathematics is concerned with the form of the particular as such.

Schleiermacher did not explore the natural sciences to any great degree, and in this domain he relied in particular on the work of Henrik Steffens (*Grundzüge der philosophischen Naturwissenschaft*, Berlin, 1806). What he did attempt to reconstruct philosophically was the self-realization of reason in the process of history. The study of history illustrates the doctrine of ethics and the doctrine of ethics structures the study of history. Since there is no transition, but rather a hiatus between ethics as a science of essence and the study of history as a science of appearances, both ethics and history have to be related to each other in theory and in practice through critical and technical procedures. Critical procedure is investigative, whereas technical procedure is regulative. While critique (*Kritik*) judges the particular appearances as representations of the ideas, technology (*Technik*) gives instructions as to how, under different natural conditions, the production of particular appearances might take place. Psychology, aesthetics, political science and the philosophy of religion belong to the critical disciplines, while hermeneutics, pedagogics and political wisdom belong to the technical disciplines.

4 Dialectics

Schleiermacher's elementary philosophy, which sets out the procedural rules for the production of knowledge, he calls 'dialectics' (first lectures 1811). In his dialectics he expounds the principles according to which speech (both dialogue and monologue) which is aimed at attaining knowledge must proceed, if it is to fulfil its task of developing contested claims into completely accepted, universally valid knowledge. Dialectics is an artificial doctrine, designed to avoid conflict and doubt in the field of pure thought and reach a permanent and harmonious accord. Thus it stands opposed to scepticism. But since dialectics presupposes a conflict about knowledge, it cannot be the beginning of all knowledge. It thus gets its meaning from its intermediary position between the already extant will to know and the perfection of knowledge. The historical and social limitations of dialectics result from the fact that all thought is bound to language.

Schleiermacher's dialectics joins metaphysics (transcendental philosophy) and logic (formal philosophy). In the transcendental part he deals with the fundamental principles, conditions and structures of knowledge, and in the technical part he gives directions as to how knowledge is to be produced. In the first part dialectics is *prima philosophia*, in the second it is a logical apparatus ('organon') for the construction of the totality of knowledge and for the evaluation of individual items of knowledge.

The mutual play of reason and sensuality lies at the root of all knowledge. Reason as an intellectual function gives overall unity and determines the form of thinking. Sensuality as an organic function furnishes the manifold

material contents. All concrete perceptions are conceptually structured, and all concepts are saturated with experience. Logic and ontology are parallel. Forms of being and forms of knowledge correspond to one another.

Two transcendental ideas which transgress the limits of real knowledge - the idea of the world and the idea of God - are none the less constitutive of all knowledge. The idea of the world signifies the totality of the oppositions which beset finite beings, and to which real thinking approximates. The idea of God means the unity without oppositions, which is presupposed by all knowledge, and to which knowledge cannot approximate. Schleiermacher pairs the ideas of the world and God, because God without the world would be an empty representation, and the world without God something purely contingent.

5 Ethics

Ethics, or the philosophical doctrine of morals (first lectures 1804-5 (1805-6)), next to which Schleiermacher places the Christian doctrine of morals (first lectures 1806 (1834-64: 1, 12)), is the science of the principles of history. In the ethical process of history, reason appropriates nature in such a way that their opposition is eventually overcome. History is complete when nature has become the organ and symbol of reason, and when what is individual and what is universal have been wholly evened out in a comprehensive process of interaction.

Philosophical ethics is a theory of culture and formulates the essential content of history, in so far as it understands the present as a phase on the way to perfection. Ethics is more descriptive than prescriptive. It tries to avoid the Kantian dualisms of duty and inclination, universal reason and individual will, ought and is (see Kantian ethics). Its central concern is the productive moral power of the individual, which manifests itself in different social situations. The morality of an individual is embedded in sociality. The moral law becomes analogous to a law of nature and understood as its improvement.

Schleiermacher divides ethics into the doctrine of the good, the doctrine of virtue and the doctrine of duty, and gives precedence to the doctrine of the good, as in ancient philosophy. The doctrine of virtue asks the question, ‘Who is good and who does good?’ and looks at the moral power of the individual. Following the ancient canon of cardinal virtues Schleiermacher recognizes four main virtues: wisdom, love, prudence and perseverance. The doctrine of duty asks the question, ‘What is good?’ and looks at the moral deed. It teaches a system of actions and modes of behaviour which shows how everyone can best promote the universal moral goal of the highest good. In the process Schleiermacher looks at the compatibility of the different fields of social action, so that law, profession, love and conscience might fit together. The doctrine of the good asks after the very concept of moral goods, which human beings produce through their moral powers and which constitute the world of ethical action. The doctrine of the good constructs the concept of the highest good through the interrelation of two pairs of opposites: the action of reason on nature is organizing or symbolizing, and it is individual or universal (identical). Accordingly Schleiermacher divides up the manifold of concrete actions using the following schema: identical (universal) organization is the concern of work, business and economics; individual organization is the concern of property, friendship, sociality and hospitality. Identical (universal) symbolization, which is articulate in speech and in thought, is the concern of science; individual symbolization is the concern of art and religion. These four fields of ethical or moral life become relatively independent through the institutions of the state, the household, the scientific academy and the church. Moral demands on the individual are embedded in the forms of community, within which morality is always already present. Imperatives aim at the development of the highest good and to this extent they can always be based upon the fact that reason has already become in some measure objective.

6 Psychology

Schleiermacher’s psychology (first lectures 1818 (1834-64: 3, 6)) complements and concretizes his ethics. The basic structures of ethics are traced to the characteristics of individuals and peoples. Schleiermacher argues that the soul, which must not be isolated from the body, is only present in the context of one’s life as a whole. The ‘I’, the basic structure of the soul, is not thought of as the aggregate of human faculties, but is disclosed through its opposite activities. The receptive activity processes the impressions which are received from outside, while the spontaneous activity is creatively directed towards the outside world. Both these directions of activity are always woven together and increase in determinacy only in the course of their development. The task of psychology is to comprehend both basic activities in terms of their genesis and their different characteristics.

Receptivity is characterized by the activity of the senses. This activity leads to a doubling of all perceptive consciousness into an objective consciousness of things and a subjective self-consciousness. Within objective and subjective consciousness there is a tendency towards ever greater generalization. By dint of its realization in concepts and language, objective consciousness strives towards knowledge in the sense of a rational species-consciousness (*Gattungsbewußtsein*). In subjective consciousness the tendency towards generalization is made manifest in the feeling of sociality and in the formation of an individual consciousness which presages the infinite at the limits of the finite. Spontaneity is likewise analysed in terms of its subjective and objective aspects. The acquisitive appropriation of the external world of nature is juxtaposed to the manifestation of the self in art and science.

7 The philosophy of religion

Schleiermacher conceives the philosophy of religion as a critical discipline, which makes a structural comparison of the various forms of religion from the starting point of the ethical basis of religion. However, he never devoted any of his lectures specifically to the philosophy of religion. In his theological writings, *Kurze Darstellung des theologischen Studiums (Brief Outline of Theology as a Field of Study)* (1811a), *Der christliche Glaube (The Christian Faith)* (1821, 1822) and *über die Religion (On Religion)* (1799), one can find numerous references to the philosophy of religion. The essence of Christianity can be ascertained from a comparison of the different forms of religion.

Religion is a sense for the infinite and is based on the feeling of absolute dependency in the immediacy of self-consciousness. It is a universal element of life which is based in the universal essence of mankind and it does not conflict with the knowledge through which it is vouchsafed in reason and experience. Christianity, philosophy and the causal sciences are all compatible.

Piety and understanding are the poles between which the life of the spirit unfolds. Philosophy, which remains a kind of negative theology, points towards its opposite pole, which it is unable to attain. Philosophy and Christian piety gravitate together in a continual process of approximation. Philosophy does not offer the foundation for piety, but provides religion with concepts for its exposition.

Theology has no space of its own in the system of sciences. As a positive science, it is functionally constituted through its external task of offering its knowledge and skills for the governing and management of the church. Dogmatic propositions describe the self-consciousness which is germane to Christian piety; their truth is grounded in this self-consciousness.

8 Aesthetics

Schleiermacher understands aesthetics as a critical discipline which speculatively comprehends art in the context of all human activities and encyclopedically grasps the historical occurrence of the different forms of art (first lectures 1819 (1819, 1825)). According to ethics, art is the symbolization of something individual. It is generated from the individual's coming to self-awareness, from the individual's sensitivity for the world and from the expressive power of the individual's imagination. Art is the organ of the representation of what is individual. All human beings are therefore artists in this sense.

Schleiermacher's aesthetics is an aesthetics of production. It begins from the standpoint of the activity of the artist, not from the content of the art work. It looks at art's process of becoming and marks the stages in which feelings become objective in a work. The original datum is the becoming of the original image in the joining together of enthusiasm and temperance. The imagination fashions an internal image into the form of a work. This presentation in the material can then be experienced by others.

Schleiermacher's aesthetics is an aesthetics of expression. It examines the expression of subjective feeling, which at the same time brings to appearance something that is universally human. What is only inchoate in nature is made complete and explicit in artistic activity. In art the productive spirit shows itself to be that which interprets and advances creation.

Schleiermacher's division of the arts follows the fundamental distinction of his psychology between self-consciousness and object-consciousness. The visual arts of painting and sculpture proceed from

object-consciousness, by forming and physically realizing representations in free imaginative productions in external media. Music and mimic art proceed from self-consciousness by creatively shaping the articulation of feeling through gesture and sound. Poetry unites both poles, although it is more strongly attracted to the pole of object-consciousness.

9 Hermeneutics

Schleiermacher removes hermeneutics from its traditional contexts of theology, philology and jurisprudence, and develops it into a general theory of understanding (first lectures 1805 (1819)). Hermeneutics allows for thoughts which are articulated in language to be partially understood and partially not, and thus it operates neither on the level of complete knowledge nor on the level of complete ignorance. It claims to reconstruct individual and concrete linguistic utterances methodologically, in order to determine the thought which they articulate. Diametrically opposed to dialectics, hermeneutics considers the transition between linguistic communication and universal reason. The process of understanding is open-ended and interminable, like the process of history. Every interpretative act must have a provisional grasp of the whole in order to comprehend the parts, which in their turn reveal the contours of the whole more precisely. Thus hermeneutics does have an ethical orientation, since it participates theoretically and practically in the realization of the highest good, in so far as it furthers successful communication and the formation of the scientific community.

What characterizes Schleiermacher's hermeneutics, which counts as one of the technical disciplines, is that it prescribes a method. The method specifies four procedures with which given speeches or texts have to be reconstructed: grammatical, psychological, comparative and divinatory interpretation. Since every linguistic utterance is both the product of an author and a component of a linguistic system, grammatical (objective) interpretation examines the utterance in the context of language as a whole, while psychological (subjective) interpretation focuses on the context of the individual's production of thoughts. The comparative procedure clarifies obscurities with the help of what is already understood, and to this end it requires particular historical and philological investigations. The divinatory procedure elucidates meaning and context intuitively, and to this end it is based on the autonomous productivity of the interpreter. The four basic procedures are normally put to use in combinations of two. The grammatical method is predominantly comparative, while psychological interpretation is mainly divinatory. Nevertheless, attention should be paid to all four procedures in the course of every interpretation.

The hermeneutic formula of method is complemented by its indication of the goal of inquiry - to understand a given utterance or text as well as its author, and then better than its author. So first of all interpreters have to attempt to put themselves in the position of the author, and then, distancing themselves from this proximity with the author, to make new sense of the text or utterance in the context of the linguistic system.

10 Pedagogics

As a technical discipline, pedagogics inherits its guiding concepts and basic structure from the field of ethics (first lectures 1813 (1834-64: 3, 9)). The ethical relation between individual and community, between nature and reason, provides education with its two guiding perspectives: individual education - the drawing out of the student's individual nature - and social education - the integration of the student into ethical life.

Schleiermacher distinguishes three periods of education: the family upbringing and acquisition of language; school education; and vocational training. The activity of education which is directed towards the formation of character and capacities has to promote good and suppress evil. The intellectual capacities which involve the student's *Weltanschauung* (worldview) are honed on the scientific study of history and nature; the ethical capacities, which concern their *Weltbildung* (their way of making the world) are formed through the undertaking of ethical and human tasks.

Since pedagogics as a technical discipline presupposes that a certain level of culture has already been attained, it imposes the twofold task of preserving the ethical *status quo* and ameliorating what is still ethically imperfect. Schleiermacher puts his pedagogics in the historical situation of Europe after the French Revolution, namely in the conflict between a traditionalism hostile to all reform and a revolutionism hostile to all tradition. His great aim is the overcoming of social inequality, of the division between aristocracy and bourgeoisie. The pedagogics of ethical

perfection is supposed to smooth the path of progress without revolutionary force and thus shows itself to be in accord with the Prussian policy of reform.

11 Politics

Schleiermacher conceives politics as a combined critical and technical discipline (first lectures 1808-9 (1980-: 2, 8)). Politics indicates the general perspectives from which existing states are to be appraised. Thus political activity can be harmonized with the level of culture, which for Schleiermacher is characterized above all by the Prussian reform movement and the national uprising against France.

The state is constituted by the distinction between government and people, and by the presence of an accepted law. It is a social institution which regulates identical organization (the communal mastery of nature) and thus guarantees the subsistence of the citizens. The state therefore has a particular orientation towards administration and economics. In this way Schleiermacher downgrades the significance of the military. The progress of culture is furthered by labour. Schleiermacher rejects capital punishment, offensive wars, violent revolutions and enforced colonization.

The state has to overcome the basic tension between the individual and the universal will; it must take upon itself the task of restraining private interest where it threatens the public good, but must also restrict itself and leave private interest to its own devices where such interest serves the ends of humanity. The state must take appropriate measures to intervene in the labour process, in order to ensure that the universal interest is served. It must not become an economic subject in the process, however, but must guarantee social welfare in the way in which it would uphold a legal duty.

Schleiermacher holds constitutional monarchy to be the most appropriate form of constitution for large, modern nation-states. In a constitutional monarchy the legislative power extends from the people to the king, and the executive power extends from the king to his subjects. Standing above all private interests, the king is in an excellent position to guarantee the universality of freedoms and justice. Aristocracy has the disadvantage that it fixes differences in class and status. Democracy has the disadvantage that public and private interest can come into intractable conflict with each other.

Schleiermacher accords the state no primacy over other forms of community. He rather places the state beside church, household and academy of science, so that religion, free sociality and science are thereby removed from its jurisdiction.

Schlick, Friedrich Albert Moritz (1882-1936)

Moritz Schlick is usually remembered as the leader of the Vienna Circle, a group that flourished from the late 1920s to the mid-1930s, and made an important contribution to the philosophical movement known as 'logical empiricism'. Yet many of Schlick's most original contributions to philosophy antedated the hey-day of the Circle, providing the foundations for much of its subsequent development. He started his academic career as a physicist, and his early contributions to philosophy include an influential conventionalist interpretation of general relativity and a new account of the definitions of the basic terms of theoretical science. In the debates that flourished within the Vienna Circle he is famous for his commitment to the Principle of Verifiability and his defence of a correspondence theory of truth. In addition, his works during the final years of the Vienna Circle represent some of the most sober reflections on the problems that vexed the early logical empiricists. Although few of the views identified with logical empiricism currently find favour among philosophers, their approach to philosophy, especially their identification of its central perplexities, still wields enormous influence among contemporary thinkers. Since Schlick contributed significantly to the form logical empiricism assumed during its period of dominance, there can be little doubt that his thought continues to inspire much philosophical thinking today.

1 Spacetime and conventionalism

Schlick originally planned a career in physics, and finished his doctorate under the direction of the Nobel prize-winner Max Planck, in 1904. Within a few short years his interests turned to philosophy and he soon he produced a youthfully enthusiastic ethical tract (*Lebensweisheit*) as well as a long essay on the concept of truth. Schlick's work on truth was an impressive achievement, for it not only provided an extensive discussion of the major treatments of truth then prevailing in German academic philosophy, it also contributed an original analysis of the nature of truth. Schlick's basic idea was that truth consists in what he called the 'univocal designation' by a judgment of a situation in the world. Judgments consist of constituents that must be coordinated with elements of reality, in order for the judgment to possess any external significance at all. If the constituents of a judgment are combined in such a way that the judgment as a whole univocally designates a situation in the world, then it is true; if not, the judgment is false. In the prevailing context of German Neo-Kantianism, Schlick's analysis of truth was strikingly innovative. Yet its greatest significance derives from the role it subsequently played in his interpretation of the new physics of relativity theory.

It was Schlick's philosophical interpretation of relativity theory that first brought him to eminence, not only among scientifically-minded philosophers but also in the eyes of prominent physicists. Schlick pioneered the conventionalist understanding of relativity that prevailed in the 1920s and eventually became a cornerstone of logical empiricist philosophy of science. After treating the Special Theory in an article in 1915, he applied his insights to the General Theory in a highly reputed monograph, *Space and Time in Contemporary Physics*. There Schlick's interpretation results from combining his insights concerning the nature of truth with a geometric conventionalism drawn from Jules Henri Poincaré.

Schlick recognized that the system of geometry and physics is not just a series of purely symbolic formulas unrelated to experience; the symbols occurring in geometric and physical expressions must be coordinated with elements of reality. Not only must the geometry and physical principles be chosen, they must be interpreted in experience by coordinating their symbols with identifiable empirical situations, or elements thereof. But once the system of geometry, physics, and symbolic coordinations is in place, there are still choices to be made. For, according to Schlick's work on the concept of truth, the goal is to provide a univocal designation of reality and, as the history of physics has taught, there are often distinct systems, each of which provides an unambiguous representation of reality. The choice among equivalent systems of representation can only be founded on considerations of simplicity, for no other consideration can adjudicate between equivalent systems that univocally designate reality.

A similar line of reasoning had led Poincaré to his own geometric conventionalism. Poincaré reasoned that, since the choice of a geometry can only be guided by considerations of simplicity, physicists will always opt for the simplest geometric system. Moreover, since Euclidean geometry is the simplest, physicists will always choose it over any alternative. Departing from Poincaré's conclusion, Schlick insisted that it is not just geometry that is

conventionally selected, but the whole system - including physical principles and empirical coordinations as well. Since, as Kant had already noted, it is never space itself, but only the motion of bodies in space that is the object of perception and measurement, it makes no sense to speak of the geometry of space apart from a specific understanding of the physical principles governing motion. There simply is no fact of the matter concerning which geometry best describes space, independently of a specific understanding of the behaviour of bodies. Consequently, the choice of a particular geometry can never be made apart from the construction of a specific theory (see Kant, I. §5).

Schlick's conventionalist interpretation would eventually prevail as the dominant understanding of the new physics; it was immediately acclaimed by Albert Einstein himself, who aided Schlick's efforts to obtain a position at the University of Kiel, which he assumed in 1921 (see Conventionalism).

2 Epistemology

Schlick then applied his understanding of physical knowledge to other domains, in his *General Theory of Knowledge* of 1918. There Schlick furthered his claim that his conventionalist epistemology distinguished itself not only from the metaphysics of Kant but from the phenomenalism of Ernst Mach as well. Philosophers like Ernst Cassirer and Hans Reichenbach rejected Schlick's conventionalism, claiming instead that if Kant were 're-worked', his philosophy could comprehend Relativity. But Schlick argued that, once Cassirer had 're-worked' the synthetic a priori (see Kant, I. §4) to fit relativity theory, little was left of what was ingenious about Kant's doctrine. Reichenbach's objection was different: although he explicitly subscribed to many of Schlick's own premises, he could not see how concepts could be formed without the Kantian a priori.

It was at this point that Schlick made a contribution that helped wrest twentieth-century philosophy of science from the grip of the past. Schlick had, in *General Theory of Knowledge*, provided an account of concept-formation by means of the doctrine of implicit definition, and Reichenbach himself had relied on it without fully appreciating its significance. Schlick borrowed the idea of implicit definition from the mathematician David Hilbert, in order to demonstrate how scientific concepts are formed according to a conventionalist philosophy. Hilbert utilized the method for application to geometry, arguing that the geometric primitives were defined by the axioms of the system, whether the system was Euclidean or one of the non-Euclidean geometries. But the philosophical significance of the method was not recognized until Schlick promoted it as a method of concept-formation generally applicable throughout the sciences. Schlick's idea was simply that one function of the most fundamental postulates of any science is to give sense to the key terms occurring in it. Thus generalized, the doctrine of implicit definition not only obviates the need for a Kantian a priori to constitute concepts, it reveals a method of concept-formation distinctly at odds with the 'abstraction and generalization' pattern characteristic of empiricist philosophies, like the phenomenalism of Ernst Mach. Thus Schlick's new epistemology blazed an original trail that departed from time-worn paths.

3 The Vienna Circle

By the time the second edition of *General Theory of Knowledge* appeared in 1925, Schlick had already been exposed to new ideas that would deeply affect his thinking. In 1922, he assumed the prestigious chair of *Naturphilosophie* at the University of Vienna, which had been occupied by such luminaries as Ludwig Boltzmann and Ernst Mach. There he became involved with other scientifically-minded thinkers, including mathematicians and social scientists as well as philosophers. This group, the precursor of the Vienna Circle (see Vienna Circle), was interested in the latest developments in logic and the foundations of mathematics; indeed, one of their earliest projects was to read and discuss Ludwig Wittgenstein's *Tractatus Logico-Philosophicus*. Soon Rudolf Carnap would join the faculty at Vienna and provide Schlick with yet another source of innovative ideas.

By the late 1920s, Schlick began meeting with Wittgenstein in Vienna, discussing all sorts of philosophical topics, especially ones that arose from scientific contexts. The result was one of the most thoughtful interchanges on issues in geometry, physics, and philosophy of science between two of the major thinkers of the twentieth century. These discussions, as well as Schlick's interaction with his University colleagues, served as a prelude to the period of greatest activity in his philosophical career. Indeed, it was from the heady intellectual atmosphere created by these exchanges that the Vienna Circle would emerge, and Schlick would become its natural leader. More significant, perhaps, is that it was in this period that Schlick first articulated his own variety of logical empiricism.

And though many have cited this period as one in which Schlick abandoned the views of his earlier years, there is a natural continuity that ties his entire career together.

These new influences first became apparent in Schlick's attempts to address the challenge to traditional conceptions of causality raised by microphysics. He envisaged a stratification of principles, ranging from statements describing singular statements of fact, through empirical hypotheses, to philosophical principles. Statements at the lowest level, asserting the existence of individual states of affairs, embody all the evidential content of science. Wittgenstein had suggested that hypotheses are introduced to systematize these singular statements, by providing universalized characterizations of a limitless number of cases. Thus the utility of hypotheses lies in their function in the framing of predictions. From the hypothesis 'All *F*s are *G*s', along with the knowledge that some particular *x* is an *F*, we could predict that *x* will be a *G*. Hypotheses may thus be conceived as rules for forming expectations, as Wittgenstein suggested. But, as Wittgenstein further noted, to accept an hypothesis is not just to recognize that it yields accurate predictions, it is also a commitment to the existence of the ontology it posits, to the range of entities described by the terms of the hypothesis. Just employing the term 'electron' and its ilk in an hypothesis commits one to a microphysical ontology. Schlick took Wittgenstein's ideas a step further, and argued that, just as hypotheses may be understood as rules for forming predictions, the causality principle is a rule for framing hypotheses. Analogously to the relation of hypotheses to singular statements, certain philosophical principles control our formation of scientific claims. One such principle is the causality principle. Although the principle of causality is usually taken to express a claim about the nature of the world, it is really a prescription for framing hypotheses. Taken as such, the principle recommends forming hypotheses that yield absolutely precise predictions. And the new developments in quantum physics show that the utility of the causal principle is limited by discoveries in the submicroscopic domain.

4 Empiricism

Schlick's reasoning was guided by a precept that would play a larger and larger role in his thinking, the Principle of Verifiability. Schlick regarded this principle as the core of his empiricism. And though it has been interpreted in nearly as many ways as there were early logical empiricists, Schlick's understanding of the Verifiability Principle was one of the most liberal. Roughly speaking, what this principle required was that every meaningful statement asserts only what can be verified in experience. Schlick hastened to add that this does not mean that only experience is real, for such a claim would itself be meaningless. Nor did Schlick employ the principle to exclude from significant discourse physical statements which assert more than can be verified in a finite number of immediate experiences. Rather, Schlick used the Verifiability Principle only to dismiss as empty typical philosophical theses that assert the reality of one domain of entities to the exclusion of others, such as the thesis of positivism, construed as the assertion that only immediate experience is real and implying that physical objects are mere constructions out of immediate experience that summarize regularities within the given. Since whether this thesis were true or false would make no difference in our experience, the thesis is meaningless. And the same holds for the realist thesis that only physical objects are real. Like positivism, this thesis purports to assert the reality of one domain while denying others, but does not make any claim that can be verified in experience.

Schlick also deployed the Verifiability Principle to revive, in a somewhat altered form, a distinction already present in his earlier thought. In *General Theory of Knowledge*, he had created a deep division between concepts, formally constituted by means of implicit definitions, and intuitions, the experiences to which concepts must be linked to provide us with knowledge of the world. Later, Schlick identified the conceptual structure of our knowledge with its form, and intuitions as its material content, citing the concurrence of Carnap and Wittgenstein. The structure of our knowledge is embodied in the logic of the language in which we express it, but the intuitions to which each of us connects concepts are purely subjective. Thus, although private experience is the ultimate touchstone of the truth of our beliefs about the world, it can never be expressed, although its structure may be. For what, Schlick asked, would it mean to compare the subjective experiences of distinct individuals, other than to relate the ways in which the individuals have structured those contents? Since there is no means of verifying sameness or difference of the contents of distinct individuals, the question of their comparison cannot be answered. The consequence, which Schlick called 'The Thesis of the Incommunicability of Content', is that content, the ineffable material of experience, can never be expressed.

Although other members of the Circle, especially Carnap, had developed versions of the form-content dichotomy,

most had abandoned it by the time Schlick was working out his own ideas on the matter. By then the other Circle members were embracing physicalism: the idea that all scientific discourse could be expressed in the language of physics. In particular, they thought that statements expressing the results of observation, so-called ‘protocol sentences’, could be expressed in the everyday language of material things. Recognizing that such statements are, by their very nature, fallible, they admitted there was no absolutely secure basis for science. Some members of the Circle even flirted with the coherence theory of truth, the idea that truth consists in the consistency of the statements accepted by the community of scientific practitioners (see Truth, coherence theory of). Schlick was adamantly opposed to this last development, for it contradicted his long-standing view that truth is a property of statements that correspond to the facts (see Truth, correspondence theory of). In his classic essay, ‘On the Foundation of Knowledge’ (1934), he acknowledged that coherence was necessary for truth, but denied that it was sufficient. His argument involves little more than pointing out that, if coherence sufficed for truth, a well-crafted fairy tale would have to be accorded the same status as the finest textbooks in physics, chemistry, etc. Schlick then proceeded to sketch his own positive account, in which the correspondence doctrine was substantiated by the idea that the body of knowledge rests on a foundation of beliefs which directly correspond to what is observed. The foundation consists of physicalistic protocol sentences which, as Schlick and the other Circle members recognized, are fallible. But these observation statements are, in turn, grounded in fleeting momentary experiences he called ‘affirmations’. Affirmations themselves are absolutely certain, though this epistemic property is not transmitted to the fallible, physicalistic protocols to which they give rise. Naturally, Schlick’s claim that affirmations were ‘certain’ provoked immediate opposition within the Circle, mostly from members who did not understand that, on Schlick’s view, affirmations were little more than occasions for the assertion of proper observation reports and, as such, lie outside the system of science.

But the criticism and opposition to Schlick’s ‘Foundation’ essay gave him the opportunity to clarify his views on fundamental philosophical issues. He continued to maintain his earlier conventionalism, though expressed in terms of the choices to be made between alternative languages. He especially emphasized the limits of his conventionalism, denying that it allowed the possibility of adopting languages in which observational statements did not play a privileged epistemic role. This latter qualification was founded on his empiricism, expressed in the form of the Verifiability Principle. Thus, in his last essays, Schlick defended a form of empiricism that acknowledged the limited role of conventions, as well as the fallibility of scientific beliefs, while emphasizing the foundationalist view that observation is the final touchstone - indeed, the only touchstone - of the truth of our claims about the world.

On 6 June 1936, Schlick was on the steps of the University of Vienna when he was approached by one Johan Nelböck. Nelböck had received an advanced degree in philosophy from the University and, for some reason, had been threatening Schlick’s life for several years. Indeed, Nelböck had menaced Schlick to the extent that the authorities had committed the former to an asylum, where he was diagnosed as a paranoid schizophrenic, and released after observation. Although the simplest explanation of Nelböck’s behaviour is that he was deranged, the only evidence of his *dementia* was his threat against Schlick. But on that June day in 1936, he was in earnest, shooting Schlick four times in the abdomen and leg with an automatic pistol. Schlick died within a few hours.

Schmitt, Carl (1888-1985)

Carl Schmitt was a conservative critic of the Weimar Republic's liberal-democratic constitution. After Hitler's rise to power, he allied himself briefly to Nazism, and despite having fallen from favour and having revised his position even before the war, was never able to rehabilitate himself from the Nazi taint. Interned at Nuremberg in 1945, he was never brought to trial, but was banned from teaching thereafter. His critique of liberalism lay in liberalism's alleged inability to deal with the nature of politics. Schmitt continues to exert a vast influence on German public law, legal theory and political philosophy, as well as on European right-wing thought. His work remains important for liberals and opponents of liberalism for the challenges it poses to the neutrality of the liberal state and its legal order.

Schmitt claims that there is no rational way of deciding political conflict since the characteristic of politics is the distinction between irreconcilable friends and enemies in a pluriverse of ideologies. Liberalism attempts to construct a legal order which gets rid of political conflict by subjecting all individuals to the rule of law, the order of positive law of parliamentary democracy. But liberalism finds itself compelled to adopt a stance of neutrality between individual conceptions of the good, which allows groups of individuals to capture the legal order and thus the liberal state. The only way to end this conflict between private interest groups is for a (dictatorial) leader to reconstruct political and legal order on the basis of the vision he articulates of the substantive homogeneity of the people (*Volk*). Liberalism finds itself unable to preclude this event, since its commitment to legalism disables it from dealing with the 'state of exception', the moment when a sovereign decision is required to resolve a fundamental challenge to the *status quo* (see Rule of law (Rechtstaat); Law and morality §§1-3).

Schmitt's position is perhaps best explained in a work published in 1938, after he had fallen from Nazi favour. There he meditates on the passage from the publication of Hobbes' *Leviathan* (1651) to his own quite precarious situation.

According to Schmitt, Hobbes saw that the political order and stability of the modern state turned on eradicating political conflict within the state and displacing it to a matter of external affairs; he also saw that such order had to be maintained by a system of positive law founded on the myth of the great monster Leviathan. However, that myth cannot survive Hobbes' attempts to provide in addition a rational justification for political and legal order. Whenever Hobbes appeals to or makes room for individual reason, he subverts his own project (see Hobbes, T.). Hence Schmitt can conclude that what is required is a deeply anti-individualist or anti-liberal myth, which has the consequence that he seems to accept that those who do not fit a particular myth's otherwise arbitrary criteria for inclusion should expect no protection from the state.

Liberal thinkers today are deeply divided on such issues as state neutrality, the nature of legal order, and the proper response to the fact of pluralism and hence to potentially fundamental challenges to the legitimacy of liberal democracy. It may prove fruitful for the friends as well as the enemies of liberalism to take Schmitt seriously.

Schopenhauer, Arthur (1788-1860)

Schopenhauer, one of the great prose-writers among German philosophers, worked outside the mainstream of academic philosophy. He wrote chiefly in the first half of the nineteenth century, publishing Die Welt als Wille und Vorstellung (The World as Will and Representation), Volume 1 in 1818 and Volume 2 in 1844, but his ideas became widely known only in the half-century from 1850 onwards. The impact of Schopenhauer's philosophy may be seen in the work of many artists of this period, most prominently Wagner, and in some of the themes of psychoanalysis. The philosopher most influenced by him was Nietzsche, who originally accepted but later opposed many of his ideas.

Schopenhauer considered himself a follower of Kant, and this influence shows in Schopenhauer's defence of idealism and in many of his central concepts. However, he also departs radically from Kant. His dominant idea is that of the will: he claims that the whole world is will, a striving and mostly unconscious force with a multiplicity of manifestations. Schopenhauer advances this as a metaphysical account of the world as it is in itself, but believes it is also supported by empirical evidence. Humans, as part of the world, are fundamentally willing beings, their behaviour shaped by an unchosen will to life which manifests itself in all organisms. His account of the interplay between the will and the intellect has been seen as a prototype for later theories of the unconscious.

Schopenhauer is a pessimist: he believes that our nature as willing beings inevitably leads to suffering, and that a life containing suffering is worse than nonexistence. These doctrines, conveyed in a literary style which is often profound and moving, are among his most influential. Equally important are his views on 'salvation' from the human predicament, which he finds in the denial of the will, or the will's turning against itself. Although his philosophy is atheist, Schopenhauer looks to several of the world religions for examples of asceticism and self-renunciation. His thought was partially influenced by Hinduism at an early stage, and he later found Buddhism sympathetic.

Aesthetic experience assumes great importance in Schopenhauer's work. He suggests that it is a kind of will-less perception in which one suspends one's attachments to objects in the world, attaining release from the torment of willing (desire and suffering), and understanding the nature of things more objectively. The artistic genius is the person abnormally gifted with the capacity for objective, will-free perception, who enables similar experiences in others. Here Schopenhauer adopts the Platonic notion of Ideas, which he conceives as eternally existing aspects of reality: the genius discerns these Ideas, and aesthetic experience in general may bring us to comprehend them. Music is given a special treatment: it directly manifests the nature of the will that underlies the whole world.

In ethics Schopenhauer makes thorough criticisms of Kant's theory. He bases his own ethical views on the notion of compassion or sympathy, which he considers a relatively rare quality, since human beings, as organic, willing beings, are egoistic by nature. Nevertheless, compassion, whose worldview minimizes the distinctness of what are considered separate individuals, is the only true moral impulse for Schopenhauer.

1 Life

Arthur Schopenhauer was born in Danzig in 1788 into a wealthy and enlightened business family. Following a childhood of sound school education and wide travel in Europe he attended the universities of Göttingen and Berlin, gravitating to philosophy after studying a number of subjects. He was most impressed by the writings of Kant and Plato, but also came across the Hindu Upaniṣads. These three he later claimed as his greatest influences. However, Schopenhauer's early impressions of the German university system were not favourable. He found the lectures of Fichte in particular to be pretentious and vacuous. While his inheritance from his father allowedSchopenhauer financial security, he developed a contempt for professional university philosophy which eventually became focused on Hegel, its leading figure.

The most creative period of Schopenhauer's life was the decade 1809-18, when he was in his twenties. He gained his doctorate in 1813 with a dissertation entitled *Über die vierfache Wurzel des Satzes vom zureichenden Grunde (On the Fourfold Root of the Principle of Sufficient Reason)*, a work which he always regarded as integral to his philosophy and which he revised substantially for republication in 1847. In 1816 he published a short work *Über das Sehn und die Farben (On Vision and Colours)*, which had its origin in a collaboration with Goethe.

The work which outshines all Schopenhauer's others, *Die Welt als Wille und Vorstellung (The World as Will and Representation)*, was published in 1818. It aimed to present a complete philosophical system, starting from a modified Kantian idealism and a metaphysics of the will embracing both the self (the microcosm) and the world (the macrocosm), and moving on to present original doctrines concerning aesthetics, ethics and the nature of human existence. Schopenhauer adhered to the philosophy of this work for the remainder of his life, and revised it for publication in 1844 with the addition of a second volume of elucidatory essays that more than doubled its length. There is little genuine intellectual development in Schopenhauer beyond 1818. His later writings give more reflective expression to the same set of doctrines.

Schopenhauer made an abortive attempt to begin a career at the University of Berlin in 1820, but scheduled his lecture at the same hour as Hegel's and had no audience. His hatred for Hegel's philosophy and the university system became intense. His own work, which he considered a great contribution to philosophy, went almost unnoticed. After a period of instability Schopenhauer settled in Frankfurt am Main in 1833, and remained there, leading a largely solitary life, until his death in 1860. His publications during this period were *Über den Willen in der Natur (On the Will in Nature)* (1836), *Die beiden Grundprobleme der Ethik (The Two Fundamental Problems of Ethics)* (1841), the second, two-volume edition of *The World as Will and Representation* (1844), the second edition of *On the Fourfold Root* (1847) and *Parerga und Paralipomena (Parerga and Paralipomena)* (1851). In the final decade of his life he prepared second editions of *On the Will in Nature* and *The Two Fundamental Problems of Ethics*, and in 1859 a third edition of *The World as Will and Representation*.

All Schopenhauer's publications from the 1830s onwards were designed to defend and amplify the ideas set out in *The World as Will and Representation*. *On the Will in Nature* attempted to support the metaphysical doctrine of the will with empirical evidence taken from the various sciences. *The Two Fundamental Problems of Ethics* is a compilation of the separately written essays *Über die Freiheit des menschlichen Willens (On the Freedom of the Human Will)* (1839) and *Über die Grundlage der Moral (On the Basis of Morality)* (1840). These were composed as entries to essay competitions set in Norway and Denmark. Because of the anonymity of the competitions, Schopenhauer could not rely on a full exposition of his philosophical system. The result is a pair of well-argued, self-contained essays which make an interesting contribution to ethics.

After the publication of *Parerga and Paralipomena*, a wide-ranging collection containing substantial philosophical essays, polemical pieces and popular aphorisms, Schopenhauer's philosophy was more widely recognized, and in old age he began to enjoy something of the popularity which continued for half a century after his death. During this time he became through his writings one of the greatest intellectual figures in European culture, and his influence may be traced in different ways in, among others, Wagner, Nietzsche, Tolstoy, Hardy, Freud,Jung, Proust,Thomas Mann and Wittgenstein.

2 Early work

At university Schopenhauer took greatest interest in the writings of Kant and Plato, and in certain doctrines of Hinduism. Volume 1 of his surviving *Manuscript Remains* (1966-75) shows that from around 1813 he was trying to produce a critical synthesis of these sources. Schopenhauer worked initially with a dichotomy between 'empirical consciousness' and what he called 'better consciousness'. He associated empirical consciousness with appearance, individuality and suffering, and saw the better consciousness as the experience of a higher reality in which the mind could penetrate beyond appearances, lose its sense of individuality, and enter a state free of suffering. The idea had both religious and aesthetic associations. Kant's influence is present in Schopenhauer's use of the appearance/thing-in-itself distinction and his attempt to characterize the empirical world in terms of the a priori forms of space, time and causality imposed by the subject of experience. The Platonic influence shows in the notion of a higher, pain-free cognition of a timeless reality lying beyond the empirical. From the Hindu writings he adopted the doctrine of the veil of *māyā*, the view that ordinary consciousness is enmeshed in illusion, and the idea that at a fundamental level the distinctness of individuals is illusory (see Monism, Indian). At this stage Schopenhauer was prone to conflate his disparate sources. For example, he assumed that Kant's thing-in-itself andPlato's Ideas were the same - a mistake which he later corrected, but whose effects his theory never entirely lost (see the opening of *The World as Will and Representation*, Third Book).

During the same period Schopenhauer wrote his dissertation, *On the Fourfold Root*, taking as his theme the principle of sufficient reason which states '*nihil est sine ratione cur potius sit quam non sit*' (nothing is without a

ground or reason why it is rather than is not). This principle may concern distinct species of ‘reason’ or ‘ground’, and hence different species of explanation. Schopenhauer seeks to clarify matters by mapping out four distinct kinds of explanatory principle, which he calls the sufficient reason of becoming, the sufficient reason of knowing, the sufficient reason of being and the sufficient reason of acting. The framework of *On the Fourfold Root* is Kantian. Schopenhauer uses the dichotomy of subject and object, in which objects are the known and the subject is the knower that can never itself be an object of knowledge. What can be known as objects are representations (*Vorstellungen*) which the subject has. The four kinds of explanation in the dissertation concern different classes of representations and the connections between them.

Schopenhauer followsKant in describing empirical consciousness as consisting of representations organized by the a priori forms of space and time. The empirical content that fills these forms is matter, appearing to the subject as distinct spatiotemporal objects. Schopenhauer’s first kind of connection among representations is the ‘principle of the sufficient reason of becoming’, which asserts that every state that appears must have resulted from a change that preceded it. This version of the principle is thus the ‘law of causality’. Schopenhauer’s discussion of causality builds on but also criticizesKant’s, and is the longest and most successful section of *On the Fourfold Root*. Space and time also yield the distinct explanatory principle which Schopenhauer calls the ‘principle of the sufficient reason of being’. This is supposed to cover reason-giving in mathematics.Schopenhauer here relies onKant’s idea that mathematics involves non-empirical, a priori intuition of spatial position and temporal succession. Space and time themselves are described as objects or representations for the subject, and the connections in space and time cognized a priori are termed relations of ‘mathematical necessity’. Concepts are held to be another distinct class of representations. Schopenhauer calls them ‘representations of representations’, regarding them as derivative from perception by a process of abstraction. Concepts enable the subject to make judgments, and the ‘principle of the sufficient reason of knowing’ states that if a judgment is to express knowledge, it must be related to a ground - which may lie in perception, in inference from another judgment, or in the possibility of experience or thought as such. Finally,Schopenhauer states the ‘principle of the sufficient reason of acting’, or law of motivation, which says that every act of will is related to a motive which causes it. The subject’s own will is the unique object of experience which this form of the principle concerns. Schopenhauer later extended his account of the will, but in general regarded his early analysis of the forms of the principle of sufficient reason as indispensable for understanding the rest of his thought.

3 *The World as Will and Representation*, First Book

Schopenhauer divides his main work into four books, both in the original Volume 1 and in the parallel, elucidatory Volume 2. Volume 1 also contains a long appendix entitled ‘Critique of the Kantian Philosophy’. Schopenhauer regards himself as a follower of Kant, but he has many criticisms to make. For instance, he is scathing in his attack on Kant’s architectonic ambitions, his style of writing and his account of the Ideas of soul, world and God - Ideas of the ‘unconditioned’ supposedly produced by ‘pure reason’ itself, but which Schopenhauer finds suspiciously amenable to the parochial Christian tradition. This ‘Critique of the Kantian Philosophy’ is closely linked to Schopenhauer’s concerns in the rest of the work.

In the First Book Schopenhauer is primarily concerned with epistemology. He defends transcendental idealism, a doctrine whose outline and terminology he takes from Kant. Transcendental idealism states that the world of empirical things is a world of objects existing for the subject’s experience, not existing in itself; and that the reality of the empirical world (our representations) consists in its being organized in space, time and causality, the necessary principles of connection among representations, whose origin is in the subject. Of the Kantian categories Schopenhauer retains only causality. The empirical world consists of causally efficacious matter filling the forms of space and time.

A feature of Schopenhauer’s account which would have been anathema to Kant is his appeal to Berkeley’s philosophy. Schopenhauer argues that Kant’s transcendental idealism shares with Berkeley the claim that the world of empirical things is mind-dependent, the difference being that Berkeley’s contribution is exhausted by this insight, whileKant adds the account of the a priori conditions of experience to explain objectivity. Schopenhauer had researched Kant’s *Critique of Pure Reason* thoroughly, making an extensive comparison of the second edition with the first, which had fallen into neglect. He alleges that Kant’s commitment to idealism is more clearly apparent in the first edition but that he wavers in the second, in fear of being classified as a Berkeleyan.

Schopenhauer uses a number of arguments for idealism which are variants on arguments found in Berkeley (§3). He suggests that idealism is the only viable alternative to scepticism about the external world, that to imagine a world existing without the subject is impossible, and that realism commits its proponent to a world existing in the subject's representations and to a parallel, redundant mind-independent world. But he chiefly relies on his concepts of 'subject' and 'object'. All experience requires that there be both - 'No subject without object' and 'No object without subject' are, he says, self-evident truths. Schopenhauer appears confident that this is sufficient to show that material objects would not exist without a subject.

Schopenhauer's account of the subject of experience is significant. This subject, he claims, can never be an object of experience. It is not identical with the person (since persons are, at least in part, bodily, and bodies are objects of experience). It is not identical with any part of the spatiotemporal, empirical world - not any individual thing within the world. Rather, he says, 'each of us finds himself as this subject' ([1818, 1844] 1969: 1, 5).Schopenhauer uses a number of images in describing the subject: it is like an eye that cannot see itself, or the focal point at which light rays are concentrated by a concave mirror.

At the same time Schopenhauer is keen to stress that each person, while 'finding' themselves as this pure subject, is a bodily thing within the world of objects. There is a deliberate tension in his account here. Throughout Schopenhauer's philosophy idealism is set in contrast with a blunt form of materialism. Materialism, he says, cannot be the whole truth because it cannot account for the subject's experience: 'materialism is the philosophy of the subject which forgets to take account of itself'. Yet in the same passage he maintains: 'It is just as true that the knower is a product of matter as that matter is a mere representation of the knower' ([1818, 1844] 1969: 2, 13). From an objective standpoint there is ultimately only matter in space and time - and this is true also of oneself considered from an objective standpoint. But from a subjective standpoint, he thinks, we must embrace transcendental idealism and its conception of the pure, non-objective subject.

Schopenhauer makes a sharp distinction between perceptual and conceptual representations. He claims (heretically, as far as Kant is concerned) that causality, one of the basic organizing forms of experience, is not conceptual. Like space and time, it is for Schopenhauer a form of intuition (*Anschauung*). Intuition or perception is the awareness of particular, causally connected, spatiotemporal objects through the senses. Concepts, for Schopenhauer, are quite different from this. Their role is in discursive thought or judgment which may have linguistic expression, and thus in reasoning. (He accusesKant, perhaps with some justification, of not clearly separating the discursive role of concepts from their alleged role in organizing perception.) Schopenhauer has a clear view about the distinction between humans and other animals: it is simply that humans alone have concepts, language and reason. Animals have understanding (*Verstand*), however, which is the ability to perceive a world of objects, and is different not in kind but only in degree from human understanding. An interesting sub-theme in Schopenhauer is the kinship of humans and animals, rooted in his conviction that the possession merely of reason provides no grounds for regarding a species as superior. Schopenhauer regards reason (*Vernunft*) as a secondary capacity, whose 'abstract, discursive concepts… have their whole content only from the knowledge of perception, and in relation to it' ([1818, 1844] 1969: 1, 35).

4 *The World as Will and Representation,* Second Book

The Second Book moves away fromKant and brings into play Schopenhauer's conception of the will. He argues that all processes in nature are fundamentally a kind of striving or end-seeking (usually unconscious) for which the term 'will' is the most appropriate. The governing aim here is metaphysical - the will provides Schopenhauer with an account of the nature of the world-in-itself, including the underlying nature of the individual human being. At the same time he believes that evidence from animal behaviour, psychology, the natural sciences and ordinary human experience gives confirmation of his view.

The argument begins with the question: How is one aware of one's own body? Schopenhauer's previous account of the subject in the First Book severed the knower from the known: the possessor of empirical knowledge surveyed the totality of objects comprising the spatiotemporal world, but was at no place within that world. But if I am such a subject, the body I call mine will be for me simply 'an object among objects', and I will not understand its movements except by the kind of observation and inference I apply to all empirical processes. As Schopenhauer says, this is not how things are: I do not generally relate to my body's movements in this way. I understand them 'from inside', and I understand them as my 'will'.

Schopenhauer's view of action is firmly anti-dualist. 'Act of will' is not, for him, the description of any purely mental event:

> The act of the will and the action of the body are not two different states objectively known, connected by the bond of causality; they do not stand in the relation of cause and effect, but are one and the same thing, though given in two entirely different ways, first quite directly, and then in perception for the understanding.
>
> ([1818, 1844] 1969: 1, 100)

This means that the account Schopenhauer gave earlier of the subject and its relation to a world of objects is now seen as inadequate. As subjects of action, we are bodily: when someone acts, the manifestation of will occurs directly in their body.

Schopenhauer goes further and states that 'the whole body is nothing but objectified will'. Here we must be careful. He calls the process of digestion, for example, one in which will manifests itself. But he does not mean that the digestive system develops and functions in conscious or rational pursuit of a goal. The term 'will' applies equally to 'blind' processes, and Schopenhauer wishes to regard the whole body as an expression of will only in the sense that its processes, such as digestion, can be explained by the end they serve for the organism. This part of his philosophy centres around his conception of the will to life (*Wille zum Leben*). Life is not an end which is consciously or rationally chosen by living things - primarily, this is not even the case with living things that are conscious and rational - but their morphology, behaviour and psychology convince Schopenhauer that life is the end for which they are organized. He paints a vivid picture of the whole of animate nature as forever striving, struggling and competing to live and to further life by producing offspring. Conscious, rationally caused willing in humans is merely the highest sophistication of this will to life that permeates nature.

Since human beings are as much organic expressions of the will to life as any other living thing, Schopenhauer thinks we should not overestimate the fact that we are subjects of knowledge, applying the classifications of space, time and causality, understanding the empirical world and making rational judgments. We are organisms whose brains and other physiological processes enable us to perform these functions, but the innermost core of the human being, as of every organism, is the will. Our mental processes are almost always at a deeper level subservient to the 'blind' will to life. Schopenhauer sees a complex interplay between this will and the conscious intellect. His idea that the intellect is often forced to follow the 'secret purposes' of an underlying will which it cannot control has been seen as a precursor of Freud's view of the unconscious. Freud also acknowledged that Schopenhauer had prefigured him in his treatment of sexuality. Schopenhauer links sexuality with the drive to reproduce, one principal way in which the will to life manifests itself throughout nature. He is not surprised, therefore, to find that sex is constantly, if 'secretly', present in human behaviour: 'It is the ultimate goal of almost all human effort; it has an unfavourable influence on the most important affairs, interrupts every hour the most serious occupations' ([1818, 1844] 1969: 2, 533).

The doctrine of the will is, however, supposed to extend well beyond animate nature. All natural processes, including those such as magnetism and gravity, are to be seen as manifestations of will: as if, with or without consciousness, with or without life, every bit of the world must be striving for some end or other. It is essential to Schopenhauer's thought that there is no supreme end, no grand design, purpose or meaning. There is no answer to the question why the will wills as it does. Nevertheless Schopenhauer discerns a kind of internal order within the world as will. There are a determinate number of natural kinds: nature is not haphazard but falls into distinct species and repeatable law-like processes.Schopenhauer says that in addition to the individual things and events of the empirical world, there are eternal Ideas, those forms, such as 'lion' or 'oak tree', which may be shared in by many individual lions or oak trees. He calls these Ideas 'grades of the will's objectification'.

Schopenhauer's 'world as will' is an exercise in metaphysics, an attempt to say how the world is in itself. Thus it becomes clear that his idealism has a different purpose fromKant's: he wants to separate the empirical world, existing only in the subject's representations, from the world as it is in itself, in order to give a positive account of the latter. Schopenhauer's 'key' to the will as thing-in-itself is provided by action. The 'inner' awareness I have of my own will manifesting itself in the body supposedly points me towards what exists beyond the realm of representations altogether. My 'inner' awareness shows me that what I *am* in myself is will. Rather than maintain a kind of theoretical egoism (or solipsism) in which I alone have this essence - a view which he regards as

irrefutable but mad - Schopenhauer advocates extending the same insight to the world as a whole.

Schopenhauer uses the expression ‘the will’, implying that the whole world of objects is the expression (or ‘objectification’) of one thing-in-itself. There cannot be a plurality of things-in-themselves: space and time are the principle of individuation (*principium individuationis*), but space and time do not apply to the thing-in-itself. Also the relation between the ‘in itself’ and the empirical cannot be causal, because causality has legitimate application only within the realm of representations. Schopenhauer says instead that the thing-in-itself (the will) ‘objectifies itself’ as a multiplicity of empirical things. This means simply that the world’s experienceable aspect (the world as representation) consists of many spatiotemporal things, whilst considered as it is in itself (the world as will) it is not composed of distinct individuals (see Monism).

This metaphysical system is beset by problems. Even if it makes sense to say that the same world is, under one aspect, divisible into many empirical things, and under another aspect one single thing, there remain at least two further difficulties. First, it is unclear how Schopenhauer is entitled to any knowledge at all of the thing-in-itself. And second, there is some mystery as to why the thing-in-itself is best called ‘will’. Schopenhauer says that our own willing is the nearest we ever come to knowing the ‘in itself’ of anything, so ‘will’ is the best term available to describe *the* thing-in-itself. Yet clearly neither the world-in-itself nor the majority of its phenomenal manifestations exhibit will in the way a human agent does. ‘Will’ threatens to become just a proper name for the world - but that in turn robs Schopenhauer’s theory of any power to understand or interpret the world. He sets out to ‘solve the riddle’ of the thing-in-itself. It remains unclear how that is to be achieved.

5 *The World as Will and Representation*, Third Book

Schopenhauer associates the will with misery. The will to life drives us on through an ever-ramifying set of desires and goals, but we reach no ultimate point or final satisfaction. To have desires unsatisfied is to suffer, to have needs is to be vulnerable to deprivation, and - the final irony - to be without needs usually brings only a state of empty boredom waiting to be filled by a further cycle of desires.

Yet there is alleviation of this condition, in the form of aesthetic experience, which is the topic of Schopenhauer’s Third Book. The unifying thought in Schopenhauer’s aesthetic theory is that one may have perceptual experience while the will is suspended. Such an occurrence is comparatively rare because the intellect is by nature a tool of the will and not prone to contemplating reality with the objectivity and freedom from desires that aesthetic experience demands. In aesthetic experience one is sunk in contemplation of some object and ceases to impose upon it the usual spatial, temporal and causal connections: ‘we no longer consider the where, the when, the why and the whither of things, but simply and solely the *what*’ ([1818, 1844] 1969: 1, 178).

Aesthetic experience, whether of nature or of art, has value for Schopenhauer because it is a temporary state of calm will-lessness, from which desire and suffering alike are excluded. But he also sees in aesthetic contemplation a cognitive change and an alteration in one’s sense of self. The subject in aesthetic experience becomes unaware of its separateness from that which it experiences: ‘the person who is involved in this perception is no longer an individual, for in such perception the individual has lost himself; he is *pure* will-less, painless, timeless *subject of knowledge*’ ([1818, 1844] 1969: 1, 179). At the same time, the object of the experience is not merely the individual spatiotemporal thing, but one of the eternal Ideas fixed in nature. Schopenhauer’s thinking here is as follows: individual empirical things are experienced when and only when the subject applies to its representations the a priori forms of space, time, and causality. But ordinary empirical knowledge is driven by the will: it consists in brain processes whose occurrence subserves the ends of the organism. Thus, if the intellect breaks away from its service to the will, it must leave behind the forms of space, time and causality. And since we experience individual spatiotemporal things only because we impose these forms, a timeless and spaceless experience must have as its object something beyond individual spatiotemporal things. This doctrine is the descendant of Schopenhauer’s earlier thinking about the ‘better consciousness’. He believes that, by freeing one’s intellect temporarily from the will, one gains a higher form of knowledge, and becomes a pure subject, objectively mirroring reality, and leaving behind one’s identification with any individual part of the empirical world.

Although he recognizes that nature provides many opportunities for this kind of elevated contemplation, Schopenhauer’s main interest is in art, where the spectator’s experience is mediated by the activity of the artist. For Schopenhauer the true artist is a genius, by which he means someone whose intellect - the capacity for

perception, not concept-use or reasoning - is abnormally powerful and able to function in greater isolation from the will. The genius can discern the universal in the particular with greater objectivity, as it were on behalf of the rest of us, and convey this insight in perceptible form. Schopenhauer says emphatically that conceptual thinking, by contrast, is unfruitful in the arts.

Schopenhauer's writing is informed by a wide knowledge and appreciation of the various arts. He discusses architecture, painting of different genres, sculpture, poetry and drama. Each art form has Ideas (or 'grades of the will's objectification') which it is especially able to reveal. This enables Schopenhauer to place the arts in a hierarchy. At the lower end, architecture, for example, enables us to know the fundamental Ideas of gravity, cohesion and rigidity. Landscape painting displays Ideas of inanimate nature and the plant world. Other paintings reveal the Ideas of different species of animals, and finally of human beings - but the highest art form, whose speciality is the Idea of humanity in all its complexity, is poetry.

At the very pinnacle stands tragedy, which has a special significance for Schopenhauer, since the eternal Idea of humanity which it makes known contains the most profound picture of the misery of our condition. Yet tragedy's value for Schopenhauer does not lie solely in this knowledge of what he calls 'the conflict of the will with itself'. He contends that the best tragedies present the hero's will turning away from life and adopting a sublime resignation in the face of suffering - thus exemplifying the attitude which he later argues is the only genuine 'salvation' (see Tragedy §5).

Schopenhauer's account of music is especially noteworthy. He suggests that while the other arts all attempt to stimulate knowledge of Ideas by depicting individual things, music 'is as *immediate* an objectification and copy of the whole *will* as the world itself is' ([1818, 1844] 1969: 1, 257). The will expresses itself as the phenomenal world; the same will expresses itself again in music, which bypasses the level of Ideas altogether. Thus Schopenhauer maintains that the appeal of music lies in its copying the patterns of striving and resolution of the will, to which we respond because they resonate with our lives as willing beings. But no personal strivings or sufferings enter into music:

> Music does not express this or that particular and definite pleasure, this or that affliction, pain, sorrow, horror, gaiety, merriment, or peace of mind, but joy, pain, sorrow, horror, gaiety, merriment, peace of mind *themselves*, to a certain extent in their abstract nature.
>
> ([1818, 1844] 1969: 1, 261)

Hence the value of music to the listener may also be that of a will-less calm (see Music, aesthetics of §6).

6 *The World as Will and Representation*, Fourth Book

The Fourth Book of *The World as Will and Representation* concerns ethics, taken broadly to include questions about the value of human existence, and what kind of happiness or salvation we may hope for. Schopenhauer gives his views here on the nature of morality and the question of free will and responsibility. These views are equally well stated (or perhaps better stated) in *On the Freedom of the Will* and *On the Basis of Morality*. It is only in *The World as Will and Representation*, however, that his conclusions about the human condition and his advocacy of denial of the will are presented with their full power.

Schopenhauer gives an elegant case for determinism, making a distinction between freedom to act, which one has when there are no impediments to one's doing what one wills, and freedom to will. The latter raises the important question: given that one willed to do such and such, could one have willed a different course of action? Schopenhauer suggests that acts of will are caused by a combination of one's permanent unchanging character and motives, which are representations of states of affairs in the world. No act of will could have failed to occur if the same motives and the same character had been present. In this sense there is no free will. Yet the feeling that we are responsible for our actions remains.Schopenhauer tries to account for this by saying that we feel responsible for what we are - for our unchanging, intelligible character, a character which is supposedly what we are beyond the realm of the empirical (see Free will).

This view has a Kantian ancestry. But in his moral theory Schopenhauer is generally critical of Kant. He is unimpressed by the notion of a categorical imperative, seeing it as a relic of the idea that commands are issued by the absolute authority of a divine being. He also questions Kant's linking of morality to rationality; other animals

for Schopenhauer should be accorded moral status, and the fact that they lack rationality is irrelevant (see Kant, I.). His own account of morality is simple. The one genuine moral impulse is compassion (or sympathy, *Mitleid*), which he says is present in each human being in some degree. Individuals governed by compassion apprehend the world and their place in it in a superior way, and they and their actions are good.

Each individual's character - which for Schopenhauer is inborn and unchanging - has some combination of the ingredients of egoism, compassion and malice. Malice is the impulse to seek another's harm, egoism the impulse towards one's own well-being and the avoidance of harm to oneself. Egoism is the greater part of most natures, according to Schopenhauer, since as manifestations of the will to life we must strive continually to survive and further ourselves. Pure malice is as much an exception as pure compassion, but both impulses must be accepted as facts of human nature. Compassion is the impulse to seek another's well-being and to prevent their suffering, and is grounded in a vision of the world which sets less store than usual on divisions between individuals: the good man, says Schopenhauer, sees everywhere 'I once more'. The metaphysical foundation for this is the claim that individuation is not an ultimate truth in the universe, since whatever appears as distinct at the empirical level is, at the level of the 'in itself', one and the same will. If individuality is thus illusory, compassion is more profoundly justified than egoism.

The core of Schopenhauer's pessimistic assessment of the value of human life lies once again in the opposition between the individual and the world as a whole. One's existence as a bodily, striving individual emerges not only as illusory (when viewed from the highest metaphysical vantage point), but as pernicious. To be an individual in which will manifests itself is inevitably to be open to suffering. But neither the striving of which the individual's life is full, nor the suffering which accompanies it, nor the temporary achievement of satisfaction which so soon induces boredom, has any higher point or value. Schopenhauer concludes that existence as an individual human being is always a worse alternative than nonexistence. 'In fact,' he proclaims, 'nothing else can be stated as the aim of our existence except the knowledge that it would be better for us not to exist' ([1818, 1844] 1969: 2, 605). He also argues that we inhabit the worst of all possible worlds.

Death is not something to fear, in Schopenhauer's view, since the world-will which expresses itself in this one fleeting individual continues undisturbed; death is 'the great opportunity no longer to be I…the moment of that liberation from the one-sidedness of an individuality that does not constitute the innermost kernel of our true being' ([1818, 1844] 1969: 1, 507-8). Despite this, Schopenhauer does not approve of suicide, which he regards as a failure to accept life on proper terms. The suicide affirms life, but revolts against the particular sufferings life contains. The contrasting attitude whichSchopenhauer advocates is denial of the will to life, an attitude which accepts the state of being alive but acquiesces in the suffering and the non-fulfilment of desires which it brings.

The question arises whether denial of the will to life is, paradoxically, something one can bring about at will. Schopenhauer appears to think not, since he talks of 'those in whom the will has turned and denied itself' and says denial of willing 'is not to be forcibly arrived at by intention or design…it comes suddenly, as if flying in from without' ([1818, 1844] 1969: 1, 404). It is as though the will to life is a distinct agency from the individual in whom it dwells. There are two routes to this turning of the will. One is the life of what Schopenhauer calls a saint. Such a person has knowledge of the illusoriness of individuation, and their individual will is 'quieted' thereby. The attitude of saints is one of such overwhelming compassion that they do not seek to further their own ends in distinction from those of others, nor to avoid harm to themselves. The other path leading to the turning of the will is to undergo suffering so great that one's will to life gives out spontaneously, while yet one is still alive. Those in whom the will has turned attain a state which Schopenhauer describes as 'resignation, true composure, and complete will-lessness'. He asks us to consider the blissful state of aesthetic contemplation, and then to imagine it prolonged: such, he claims, is the state of will-less self-denial that is the only genuine 'salvation' for humanity. Since our existence as bodily, striving individuals is one we would have been better without, the only remedy lies in achieving a vision of the world which attaches the lowest possible importance to one's individuality.

Schütz, Alfred (1899-1959)

Alfred Schütz, Austrian-American philosopher and social scientist. Combining ideas from Weber, Bergson and Husserl, Schütz developed a methodology for social science that integrated subjectivist, phenomenological elements with the causal-explanatory aspects of traditional objectivist approaches.

Schütz was born in Vienna, where he studied law, economics and sociology, and subsequently worked as a lawyer for a banking firm while pursuing his scholarly interests in his spare time. He emigrated to the USA in 1939, and was appointed professor at the New School for Social Research in New York in 1956.

Schütz's work stands in the German *geisteswissenschaften* tradition of Wilhelm Dilthey and Max Weber (§3), which insists that social science must methodologically reflect the specific nature of its human subject matter. Human and social reality - in particular, human action - is distinctive, in that it springs from the free flow of human subjectivity; hence, a method of interpretation (*verstehen*) of this subjective basis of action is required. Following Weber, Schütz endeavoured to combine *verstehen* with an objectivistic, causal approach. He held, however, that Weber's methodology lacked an adequate philosophical analysis of human subjectivity, a gap which Schütz sought to fill, first with elements from Bergson's doctrine of the flow of consciousness, later with tenets from Husserl's transcendental phenomenology. In turning to Husserl, Schütz broadened the investigation of the subjective springs of action into a phenomenological analysis of the acts of consciousness through which social reality is constituted. Schütz, however, did not conduct a full investigation of this domain within phenomenological brackets in his main work, *Der sinnhafte Aufbau der sozialen Welt (The Phenomenology of the Social World)* (1932), but rather examined the way social reality is grasped by subjects in the everyday, 'mundane' attitude. Indeed, Schütz eventually came to doubt the power of transcendental phenomenology fully to resolve the problems of *verstehen*; instead, in his US period, he strengthened the empirical side of his work by incorporating ideas from Mead and James, among others.

Schütz's phenomenological investigation brought to light certain characteristic structural properties of social reality as grasped by the agent (the agent's social *lebenswelt*). Social reality is organized around the experiencing subject in spheres of increasing concreteness and vividness the closer they are to the subject. Closeness here refers both to an item's spatial proximity to the subject and its relevance with respect to the subject's projects; Schütz stressed the pragmatic nature of our conceptualization of social reality, a nature manifest also in the way that this conceptualization is taken for granted and never exposed to theoretical doubts. The innermost circle of social reality is inhabited by persons with whom the subject is in direct face-to-face contact. This permits a full and detailed grasp of the other's unique individuality, a privileged mode of social cognition of which other modes are derivatives. Outside this zone lies the world of our contemporaries, people who exist simultaneously with ourselves but beyond our sensory horizon; then the world of our predecessors; and finally the world of our successors, the people who shall live after we are dead. Denizens of these spheres cannot be grasped in their full individuality, but must be understood in terms of general typifying concepts of increasing anonymity the further away they are from their source in the subject's experienced here-and-now. Schütz's analysis of the social *lebenswelt* shows his debt to Bergson in the stark contrast drawn between immediate intuitive experience and abstract conceptual understanding, and is tinged with a distinctly existentialist pathos when the unique significance of the face-to-face encounter is described.

The phenomenological account of the agent's subjective life-world is an indispensable part of social inquiry in its own right and, in addition, provides tools for the construction of an objective and genuinely theoretical stratum of social science. The social scientist must push further the process of typification that is present in inchoate form in the everyday agents' understanding of their life-world, analysing the social world in terms of idealized types that are derived from the agents' own abstract classifying concepts. In expounding a methodology of ideal types, Schütz borrowed heavily from Weber. Weberian ideal types are derived from experience by the one-sided accentuation of certain selected features, which are extrapolated to full logical perfection. Ideal types permit the formulation of law-like generalizations about human action, a paradigm case of which was, for Schütz as well as for Weber, the principles of rational action as found in particular in economics. Schütz also embraced Weber's methodological individualism and his insistence that science be 'value-free'.

The suggested approach is meant to solve what Schütz viewed as the crucial methodological problem for social science, namely how to construct an objective science of the agents' subjective meaning structures. The subjectivist desideratum is satisfied because the concepts used in the proposed science retain a link to the agents' naïve, unreconstructed notions. This link is formally guaranteed in terms of a general principle of methodology, which requires that the ideal concepts be understandable to the agents themselves in terms of everyday interpretations of action. On the other hand, the scientific concepts are refined and idealized, and hence satisfy the usual scientific standards with respect to clarity, consistency and precision.

Schütz conceived of his social theory as a 'sociology of everyday knowledge', but it differs from sociology of knowledge in the Marxist tradition in its lack of critical intent. It simply describes the structure of everyday social knowledge and the way it is utilized in the agents' understanding of their social life-world. Schütz's dual methodology thus offers no directions for the social scientist in the event of a clash between its objective and subjective components, such as a failure of an ideal type to be instantiated in the conduct of the agents, despite their endorsement of the same. This might occur if the agents were the victims of an ideological misconstrual of their own motivations. Indeed, the notion of 'ideology' and related concepts are signally absent from Schütz's methodology. Thus, the compatibility of the subjectivist and objectivist aspects of Schütz's methodology of social science is tacitly assumed, rather than effectively achieved.

List of works

Schütz, A. (1932) *Der sinnhafte Aufbau der sozialen Welt*, Vienna: Julius Springer; Eng. trans. *The Phenomenology of the Social World*, Evanston, IL: Northwestern University Press, 1967.(Schütz's earliest and most penetrating work, in which he endeavours to ground Weber's interpretive sociological method on Husserlian phenomenology; rather dense.)

Schütz, A. (1962-66) *Collected Papers*, 3 vols; vol. 1, *The Problem of Social Reality*, 1962; vol. 2, *Studies in Social Theory*, 1964; vol. 3, *Studies in Phenomenological Philosophy*, 1966, The Hague: Martinus Nijhoff. (These volumes chiefly contain material from Schütz's US period. Volume 1 shows the development of Schütz's philosophy of social reality under the influence of US philosophers and social scientists. Volume 2 contains Schütz's essays within empirical social thought. Volume 3 contains Schütz's reflections, at times very critical, on the chief figures of phenomenology.)

Schütz, A. (1970) *Reflections on the Problem of Relevance*, R.M. Zaner (ed.), New Haven, CT: Yale University Press.(An edited version of a highly fragmentary manuscript found in Schütz's literary remains. Partially overlaps the *Collected Papers* and the 1973 book, but contains some new material on the phenomenology of social action.)

Schütz, A. and Luckmann, T. (1973) *The Structures of the Life-World*, Evanston, IL: Northwestern University Press.(Thomas Luckmann's edition of a manuscript left unfinished at the time of Schütz's death. Offers a more empirical and more accessible, but often less concise, version of some of the topics covered in the 1932 book.)

Schumpeter, Joseph Alois (1883-1950)

*Schumpeter is best known for his seminal work in economics, but he also made important contributions to the fields of political science and sociology. He aimed to create a broad economic science that he called 'social economics' (*Sozialökonomik*), which was to include not only economic theory but also economic history, statistics and economic sociology. Inspiration for this project came in particular from his colleague Max Weber.*

As an economist Schumpeter is primarily remembered for his theory of the entrepreneur and for his emphasis on the dynamic aspects of economic reality: capitalism, as he saw it, meant first and foremost change. But Schumpeter also made a number of interesting observations about theorizing in economics and the role that vision plays in the work of the economist. His trenchant critique of the conventional theory of democracy and advocacy of a more realistic theory is generally recognized as a major contribution to political theory. Many of Schumpeter's most important ideas on economics and politics can be found in his bookCapitalism, Socialism and Democracy (1942), which has become something of a classic in the social sciences.

1 Life

Joseph Alois Schumpeter was born in the small town of Triesch, part of the Austro-Hungarian Empire. His family was Catholic and belonged to the local elite. At the age of ten Schumpeter moved with his mother and stepfather to Vienna, where he was educated at an exclusive imperial school. As a student at the University of Vienna, he soon focused on economics and received his doctorate in 1906 at a record early age. After a sojourn in England and Egypt (where he worked as a lawyer), in 1908 Schumpeter returned to his native country to pursue an academic career as an economist. Initially very successful, he soon earned a full professorship at the University of Graz - again at a record early age. During the years before the First World War Schumpeter produced three books, which established him as one of the country's most promising young economists. One of these books - *Theorie der wirtschaftlichen Entwicklung (The Theory of Economic Development)* (1911) - is considered to be his most successful work in economic theory.

After the First World War Schumpeter tried his luck first in politics - he was finance minister for a few months in 1919 - and then as a banker and investor. Both of these enterprises ended badly, and by the mid-1920s Schumpeter was happy to return to academia. In 1932 he emigrated for personal reasons to the USA, where he was to teach at Harvard University until his death. While in the USA, Schumpeter produced three major works: the enormous two-volume set *Business Cycles* (1939), the popular *Capitalism, Socialism and Democracy* (1942) and the extensive *History of Economic Analysis*, published posthumously in 1954.

2 Early works

As a young man Schumpeter produced three books: a short history of economics, a study of economics using a conventional static approach and a study of economics using an innovative dynamic approach. The most important and original of these is the third work, which appeared in 1911 and which was translated as *The Theory of Economic Development* in 1934. It is in this work that Schumpeter for the first time presented his famous theory of the entrepreneur. In a dynamic approach to the economy, he argued, one has to assume that there exists a force *within* the economy itself that can account for change and development. This force is embodied in the entrepreneur; and entrepreneurship is defined as 'the carrying out of new combinations' (Schumpeter [1911] 1934: 66). An entrepreneur does not invent, Schumpeter says, but innovates. The original innovation produces huge profits and is soon imitated by others, thereby leading to a wave of economic change that affects the whole economy.

According to Schumpeter, there exist five basic types of entrepreneurship: (1) the introduction of a new good; (2) the introduction of a new method of production; (3) the opening up of a new market; (4) the conquest of a new source of raw materials or half-manufactured goods; and (5) a new way of organizing an industry (Schumpeter [1911] 1934: 66). Schumpeter also emphasized that the entrepreneur is not primarily motivated by the prospect of gain - the textbook image of *homo economicus*. What makes the entrepreneur act is something else: 'the dream and the will to found a private kingdom', 'the will to conquer' and 'the joy of creating' ([1911] 1934: 93).

Finally, it should be noted that the first edition of *The Theory of Economic Development* included a last chapter in

which Schumpeter suggested that the basic principles of dynamic economics could also be applied to all other social sciences. Schumpeter even supplied an outline of what such an analysis would look like. The fear of being misunderstood made Schumpeter eliminate this evocative chapter in later editions of his work however.

3 *Capitalism, Socialism and Democracy*

After not having published a book for more than twenty years, Schumpeter's *Business Cycles* finally appeared in 1939. Its reception was a disappointment to Schumpeter however, and while planning his next work in economics he undertook an interim project: the book that was to become *Capitalism, Socialism and Democracy* (1942). This work contains a provocative analysis of Marx (§12), a novel approach to the theory of democracy and the famous prophecy that capitalism will soon be replaced by socialism: 'Can capitalism survive? No. I do not think it can.' 'Can socialism work? Of course it can' (Schumpeter [1942] 1994: 61, 167).

According to Schumpeter, there existed a number of reasons why capitalism was doomed, including the fact that the entrepreneur was everywhere being replaced by managers, the intellectuals were getting out of hand and the old sense of property was vanishing. Schumpeter was very unhappy about these developments since he personally detested socialism. He did not want his own personal feelings to interfere with his scientific judgement, however, and agreed that it was, in principle, possible to have a democratic form of socialism (see Socialism §§1, 4).

While Schumpeter's approach to Marx and his thesis of the demise of capitalism are still occasionally referred to, it is however his theory of democracy that has survived best. What Schumpeter called 'the classic doctrine of democracy' had, in his mind, a simplistic and naïve approach to politics. He characterized its basic tenets in the following way: 'the democratic method is that institutional arrangement for arriving at political decisions which realizes the common good by making the people itself decide issues through the election of individuals who are to assemble in order to carry out its will' (Schumpeter [1942] 1994: 250). According to Schumpeter, this approach to democracy implied a series of errors. For one thing, there is no such thing as a 'common good' that all people can agree on. Second, if such a common good none the less existed, it would provide no guidance whatsoever in individual cases. And third, the important role that politicians play in the political process tends to disappear if they are seen simply as those persons who carry out the will of the people. A much more realistic attitude to democracy, Schumpeter continued, would be to conceptualize it as a way of selecting those people who are to govern the masses. Schumpeter's 'alternative theory of democracy' is defined in the following way: 'the democratic method is that institutional arrangement for arriving at political decisions in which individuals acquire the power to decide by means of a competitive struggle for the people's vote' (Schumpeter [1942] 1994: 269) (see Democracy §1).

Some commentators have felt that Schumpeter's own theory of democracy is cynical and elitist since it views democracy as an active enterprise only for those who govern. This view has some truth to it and Schumpeter's book contains many contemptuous remarks about the political capacity of the average person. Other commentators, however, have felt that Schumpeter's approach to democracy is refreshingly realistic and non-ideological. Finally, it should be mentioned that Schumpeter's conception of the politician as a kind of political entrepreneur (a view that has its origins in the work of Max Weber) has inspired the public choice school (see Rational choice theory §7).

4 Schumpeter's last work

When Schumpeter died in January 1950 he had almost completed the extensive history of economics which he had begun work on in the early 1940s. In *History of Economic Analysis*, published posthumously in 1954, Schumpeter tried to summarize his experience of a life as an economist, and his book covers a vast array of topics. It is here, for example, that we find Schumpeter's discussion of what he called an economist's 'vision'. Behind all the great works in economics, Schumpeter said, there is always a specific vision of how the economy works and what its building blocks are. Schumpeter defines vision in the following way: 'a preanalytic act that supplies the raw material for the analytic effort' ([1954] 1994: 41).

It is also in *History of Economic Analysis* that we find Schumpeter's most extensive presentation of his own vision of economics. Inspired very early in his career by Max Weber, Schumpeter envisioned economics as a very broad kind of science, which would encompass not only economic theory but also economic history, economic sociology

and statistics. Schumpeter emphasized that ‘the all-round economist’ must in principle be knowledgable in all of these fields. His statement that if he were to relive his life and could choose only one field, he would chose economic history, shocked his colleagues. A careful reading of Schumpeter’s last work shows, however, that its author held economic theory in very high regard. Indeed, *History of Economic Analysis* contains a number of interesting observations about the role that theory plays in economics. Theory, for example, must be closely linked to empirical reality if it is to be useful. Schumpeter also emphasized that creative theorizing has little to do with the testing of hypotheses (this comes at a later stage of the scientific process), but is rather a way of initially conceptualizing economic reality and thereby adding to the economist’s ‘box of tools’. Thus, despite his many contributions to a variety of fields in the social sciences, Schumpeter’s primary interest as an economist was, and always remained, economic theory.

Schurman, Anna Maria van (1607-78)

The first woman to attend a Dutch university, Schurman studied ancient languages and theology. Her Latin treatise on the expedience of scholarship for women made this 'Star of Utrecht' the most famous female intellectual in seventeenth-century Europe. She was among the few women to publish views on Counter-Reformation controversies concerning predestination and transubstantiation. Her autobiography served as an apology for the Pietist sect, Labadism.

1 Philosophical and theological influences

Anna Maria van Schurman studied theology, Hebrew, Arabic, Chaldanean, Aramaic and Syrian under the mentorship of Gisbertus Voetius, Calvinist theologian of the University of Utrecht. Her first publication, *Amica dissertatio…* (1638), was a scholastic defence of women's fitness for scholarship, which included a correspondence with the Calvinist theologian André Rivet; part of it was translated as *The Learned Maid…* (1659). Her correspondence on the issue of predestination with the physician Johan van Beverwijck was published as *De vitae humanae termino* (1639). This treatise, the *Dissertatio* and selected letters were published in her collected works, *Opuscula…* (1648). Throughout the 1640s, Schurman communicated both with noted philosophers, such as Gassendi, Elisabeth of Bohemia, Marie le Jars de Gournay and, via Constantijn Huygens, Mersenne, and with such theologians as Jacob Lydius, Frederick Spanheim, Gisbertus Voetius and Daniel Heinsius. In response to Claude de Saumaise's treatise on transubstantiation, she wrote an epistolary essay commenting on the views of the Church Fathers. Though she had contact with Descartes and Queen Christina of Sweden, she came to reject both for religious reasons. During the 1650s, her Pietist leanings led her to abandon all scholarship except the study of Revelation, opting to pursue a life of faith in service to others (see Pietism). After joining Jean de Labadie's Pietist community in Amsterdam in 1669, she obtained a haven for her persecuted 'household', first via Abbess Elisabeth of Bohemia at Herford in Germany, later at Altona and Wieuwerd. Her autobiography and defence of Labadism appeared in 1673 as *EYKΛHRIA: seu Melioris partis electio…* In response to charges by Huygens, Drechssler and others against Labadism, she published *Korte Onderrichting…* and wrote *EYKΛHRIA II*, which, like her biblical criticism, was published posthumously.

2 *The Learned Maid…*

Schurman's scholastic treatise begins by defining and conservatively limiting terms: 'Maid' refers to a Christian woman of 'indifferent good wit', enough wealth to pay a teacher, sufficient free time to devote to study and the following goals for her scholarship: God's glory, personal salvation, virtue, happiness, the instruction of the family, and aid to other women. 'Scholar' refers to one 'given to the study of… all kinds of Learning' and Schurman is among the first to urge that no restrictions be placed on learning for women. By 'may be' she means 'expedient, fit, decent' - a normative notion weaker than 'ought'. She advances fifteen syllogistic arguments, with refutations of adversaries' arguments, to show that: (1) women have the appropriate nature, intellectual powers and desire for all the arts and sciences; (2) study will provide them with 'a similitude of Divine gladness', or pleasure; (3) it is fitting for women to study sciences instrumental to theology, since these lead to greater love of God; (4) scholarship is especially appropriate for those with leisure time to spend at home; and (5) learning will aid women in acquiring virtue and escaping vice and heresy.

The arguments for (1) rely upon the Aristotelian view that the Form of a human being is the rational soul and 'that which is in the whole Species or kind, is in every Individual… in Maids also' (1659: 8). Schurman's assumption that there is no deformation of the rational soul in woman rests, in part, on the argument that since some maids actually learn arts and sciences (together with the Aristotelian assumption that there are no acts without corresponding powers or principles), they must be naturally endowed with the powers or principles for the arts and sciences. The arguments for (2) turn on Aristotle's views about pleasure in the *Nicomachean Ethics*. The arguments for (4) and (5) constitute one of the earliest philosophical responses by a woman to the *querelle des femmes* tradition in moralistic writings of the period (see Feminism §2). These writings, derived from the Church Fathers, assume women's inconstancy, vanity, imprudence and small-mindedness; humanist writers such as Erasmus saw these vices as augmented by women's increased leisure time. Because Schurman turns diverse moralist assumptions to her own advantage in the course of her arguments, there are occasional tensions between

syllogisms. For example, Argument IV assumes that ‘leisure… is… the Mother of wickedness’ to conclude that women must have no free time, rather ‘continual employment’. Argument V, however, positively depicts the leisurely life of maids as one with the ‘Tranquillity and Liberty’ conducive to study. But these tensions are inherent in the conflicting positions of the moralists themselves. Schurman’s purpose is to show that all roads lead to women’s fitness for learning. Indeed, Schurman’s very production of this treatise stands as an argument for her conclusion. This work, together with Marie le Jars de Gournay’s *Egalité des hommes et des femmes* (1622), spawned numerous defences of women’s intellectual and moral capacities, many by women.

3 *De Vitae Termino*

This epistolary treatise (‘Concerning the Limit of Life’) responds to Beverwijck’s questions concerning predestination: (1) How can we reconcile God’s decree concerning the ‘limit of human life’ as an event ‘fixed and immovable’, when, as part of the contingent events of this world, this limit appears ‘changeable’? and (2) Of what use are doctors or medicines ‘if they have no power at all to delay the death which fate threatens?’ ([1648] 1650: 8). In answer to (1), Schurman argues that while a limit for each mortal creature’s life has been ‘unalterably established’ by a decree of God, nevertheless, because this limit is produced ‘freely and contingently’ by the power of the subordinate causes, ‘it can most lawfully be called changeable and movable’ ([1648]1650: 6). The decree of God, then, which necessarily determines all future events, also determines the manner in which events are to take place by secondary causes, either contingently or necessarily. So, from the standpoint of a creature, and in relation to secondary causes that could have been different, the limit of life may be called ‘contingent’. Like Calvin and Descartes, Schurman none the less admits that no one can understand how ‘divine providence bends the wills of men so sweetly and strongly that they freely and willingly choose and pursue that which God has decreed’ ([1648] 1650: 23). In reply to (2), Schurman argues that while ‘the art of medicine falls short of its own end, and the limit of the dying man is ever the same’, still we should take physicians to be ‘the instruments or rather "partners" of the very Author of life and health’ ([1648]1650: 26). For, the duty of a physician is not to ’cheat the hidden plans of God, but to break the hold of disease, to soothe pains, to restore natural strength, especially when they see that death is surely imminent’ ([1648]1650: 25). Versions of Schurman’s responses can be found in earlier Reformed authors such as Calvin, Voetius, Rivet and Johannes Wollebius, and in later ones such as Francis Turretin. The treatise’s uniqueness lies in the erudition displayed in support of her Calvinist position - ancient Stoic, Sceptic, Ciceronian, Platonic, Aristotelian, Judaic, early Christian, Muslim, Thomist and Italian Renaissance sources - coupled with its authorship by a woman, given its discussion of such controversial points of Calvinist doctrine (see Predestination).
